v. 12

AMERICAN PUBLISHER'S NOTICE.

THIS work, although based upon Chambers's Encyclopædia, whose distinguished merit is widely known, differs from it in important respects. It could scarcely be expected that an Encyclopædia, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies the American Editors have inserted about 15,000 titles, arranging the whole, including Chambers's Supplement, in a single alphabet. The total number of titles is now about 40,000. The additions give greater fullness in the departments of biography, geography, history, natural history, and general and applied science. Scrupulous care has been taken not to mutilate or modify the original text of the edition of 1830; no changes have been made except such verbal alterations as are required by the omission of the wood-cuts. The titles of articles from Chambers's Encyclopædia, either from the main work or from the Supplement, are printed in bold-faced type—**AMERICA**. The titles of the American additions, whether of new topics or of enlargements of the old, are printed in plain capitals—**AMERICA**. Should it appear that an article from the English work and its American continuation disagree in any points, the reader will readily refer the conflicting statements to their proper sources.

The labor of consultation will be much reduced by the catch-words in bold-faced type at the top of the page, being the first and last titles of the pages which face each other; and by the full title-words on the back of the volume, being the first and last titles contained therein.

The word *ante* refers to Chambers's Encyclopædia, as represented in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that the article is an enlargement of one under the same title in Chambers's Encyclopædia—usually to be found immediately preceding.

LIBRARY OF UNIVERSAL KNOWLEDGE.

POMBAL, DOM SEBASTIAO JOSE DE CARVALHO, Marquis of, the greatest of all Portuguese statesmen, and one of the ablest men of his time, was b. May 13, 1699, at the castle of Soutra, near Coimbra. His father, Manuel de Carvalho, was a capt. of cavalry, and belonged to the second grade of nobility. After studying law at Coimbra, and serving a short time in the army, Pombal was banished from Lisbon on account of his youthful turbulence of disposition, and retired to his birthplace, where he devoted himself for a while to study. Subsequently he married a rich widow, Donna Teresa da Noronha Almada, and repaired to court. In 1739 he was appointed envoy extraordinary to the court of London through the influence of his uncle, Paulo Carvalho, a position which he held for six years, after which he was sent to Vienna in a similar capacity. Here Pombal (whose first wife was now dead) espoused, in 1749, Leonora Ernestina, countess Daun, niece of the famous Austrian marshal of that name. This marriage had a most felicitous influence on his future career. When Pombal returned to Portugal, the Portuguese queen, who was an Austrian princess, conceived a great attachment to his wife; and when her son, Joseph I., ascended the throne in 1750, she induced him to appoint Pombal state secretary for foreign affairs. Immediately his splendid administrative genius burst forth like a sudden blaze of sunshine. He found his country almost without an army, without a fleet, without commerce or agriculture, and all power in the hands of unscrupulous Jesuits and grasping nobles. Among his first acts was to reattach to the crown a great number of domains that had been unjustly alienated. Then followed the reorganization of the army, the introduction of fresh colonists into the Portuguese settlements, the establishment of an East Indian company, and another for Brazil, where he introduced the cultivation of coffee, sugar, cotton, rice, indigo, and cocoa. In virtue of a treaty with Spain signed in 1753, Paraguay became an appanage of the Portuguese crown, and it was in this remote region that Pombal first came into collision with the Jesuits—the founders of the Paraguayan missions. He got his brother, Francisco-Xavier de Mendonça, appointed capt.gen. of Paraguay, and is said to have given him secret instructions to ruin the Jesuits in his reports to the king. When the great earthquake happened at Lisbon in 1755 Pombal displayed an almost superhuman courage and energy, in consequence of which the king raised him to the rank of count of Oeyras, and in the following year appointed him prime minister. He crushed a revolt instigated by the great nobles and the Jesuits, the latter of whom he now removed from the person of the sovereign, deprived of the power of the confessional, and in 1757 confined to their colleges. A conspiracy against the life of the king, which broke out Sept. 3, 1753, but failed, placed his enemies completely in his power. The leaders were punished with appalling severity. The duke of Aveiro and the marquis of Tavora were broken alive on the wheel, the sons and the son-in-law of the former were strangled, and the wife of the marquis was beheaded. The Jesuits were suspected of complicity in the plot, and Pombal accused them to the pope; and when the latter would not allow the minister to proceed against them in the civil courts, he daringly caused some to be executed in prison. Father Malagrida, who had prophesied the death of the king, was delivered over to the inquisition as a heretic, and condemned to be burnt alive; and this *auto da fé* actually took place in 1761! But Pombal was not satisfied. He had made up his mind that the very presence of the Jesuits in Portugal was incompatible with the security of the government and the welfare of the nation, and by a royal decree of Sept. 3, 1759, they were banished from the kingdom as rebels and enemies to the king. When they refused to leave, Pombal had them violently removed by soldiers, carried on board ships, and transported to the states of the church. The pope, Clement XIII., vehemently protested, whereupon Pombal caused the papal nuncio to be shown across the frontier. Shortly after, Clement XIII. died, and was succeeded in the papal see by Clement XIV.—no friend of the Jesuits, in consequence of which the differences between Portugal and the Vatican were soon made up. All this time Pombal was laboring energetically to improve the cultivation of the land and the system of education. In 1770 he was created marquis of Pombal, and from this period to the death of the king in 1777, he was at the very height of his greatness.

The accession of Joseph's daughter, Maria I.—an enemy of the minister—was immediately marked by his downfall. He was deprived of his offices; the conspirators whom he kept in prison were released; many of his institutions were abolished; and he himself was only saved from the scaffold because he held in his possession documentary proofs of the former treason of his now triumphant enemies. Maria ordered him to retire to his castle of Pombal, where he died May 8, 1782. The peasantry always spoke of him as "the great marquis," and history has stamped the rustic verdict with its approval. When he was turned out of office, he left the queen a public purse containing 78,000,000 cruzados, and a well-ordered and flourishing state.

POME (Lat. *pomum*, an apple), a form of fruit of which examples are found in the apple, pear, and other fruits of the *pomaceæ*; and in which the *epicarp* and *mesocarp* (see FRUIT) form a thick fleshy mass; whilst the *endocarp* is scaly, horny, or stony, and divided into separate cells, in which the seeds are inclosed. The fruit is crowned with remains of the calycine segments. Pomes have 1 to 5 cells, or spuriously 10 cells.

POMEGRANATE, *Punica granatum*, a fruit much cultivated in warm countries, and apparently a native of the warmer temperate parts of Asia, perhaps also of the n. of Africa. It has been cultivated in Asia from the most ancient times, and is frequently mentioned in the Old Testament. It has long been naturalized in the s. of Europe. In a wild state the plant is a thorny bush; in cultivation it is a low tree, with twiggy branches, flowers at the extremities of the branches, the calyx red, the petals scarlet. It is generally referred to the natural order *myrtaceæ*. The calyx is leathery, tubular, 5 to 7 cleft; there are 5 to 7 crumpled petals; the fruit is as large as a large orange, with a thick leathery rind of a fine golden yellow, with a rosy tinge on one side, not bursting when ripe; the cells filled with numerous seeds, each of which is surrounded with pulp, and separately inclosed in a thin membrane, so that the pomegranate appears to be formed of a great number of reddish berries packed together and compressed into irregular angular forms. The pulp is sweet, sometimes subacid, and of a pleasant delicate flavor, very cooling, and particularly grateful in warm climates. It is often used for the preparation of cooling drinks. A kind of pomegranate without seeds is cultivated and much prized in India and Persia. Pomegranates have long been imported in small quantities into Britain from Portugal and the n. of Africa; but have never become an article of general demand and commercial importance like oranges. There is an ornamental variety of the pomegranate with double flowers. The rind of the fruit is very astringent, and a decoction is used as a gargle in relaxed sore throat, and as a medicine in diarrhea, dysentery, etc. Deriving its astringency from tannin, it is used to tan leather. The finest morocco leather is said to be tanned with it, and small quantities are imported into Britain from the n. of Africa for the preparation of the finest kinds of leather, under the name of *pomegranate bark*.—The bark of the roots is used as an anthelmintic and is often successfully administered in cases of tape-worm. Its value was known to the ancients, and it has long been in use in India.—The pomegranate tree is occasionally cultivated in hot-houses or green-houses in Britain. It bears the winters of the s. of England in the open air, and is very ornamental, but the fruit is worthless. In some parts of the s. of Europe it is used as a hedge-plant.

POMEL, a boss or ball used as an ornament on the top of pointed roof, turret, etc.

POMERANIA (Ger. *Pommern*), a province of Prussia, bounded n. by the Baltic, e. by W Prussia, s. by Brandenburg, and w. by the Mecklenburg duchies. Area, 11,600 sq. miles. Pop. (at the close of '75) 1,462,310. Pomerania is divided into the three governmental districts of Stettin, Stralsund, and Königsberg.

This province, which is one of the lowest and flattest in Germany, and has few hills of even moderate height, is intersected by the Oder (q.v.), which forms numerous lakes and ponds, the largest of which is the Dammer lake. The waters of this lake and of the Oder are then carried into the Stettiner Haff, from which three outlets—those of the Peene, Swine, and Dievenow—lead into the Baltic. Between these three outlets are the two islands of Usedom and Wollin. After the Oder, the chief rivers of Pomerania are the Ihna, Rega, Persante, Wipper, and Stolpe. The shores in some parts are protected by dikes and sand-banks. The soil is generally sandy, and in many districts even stony, although near Pyritz and Stargard, on the Ploen and Madue lakes, and at some points of the sea-coast, it presents a tolerably fruitful character, yielding good crops of wheat, and affording rich pasture. About half of the whole area is cultivated; about a sixth is uncultivated, or under water; and the remainder is in pastures, heath, and wood. The chief vegetable products, most of which are grown in sufficient quantities to be largely exported, are—rye, wheat, and other grain, flax, hemp, tobacco, and timber. Among the other exports of Pomerania are horses, cattle, sheep, swine, geese of superior quality, feathers, butter, wool, hams, sausages, smoked poultry, etc. The sturgeon and salmon fisheries are very productive, and Pomerania is noted for its admirable lampreys, eels, and cray-fish, which are largely exported in a pickled state. The mineral products, which are inconsiderable, include bog-iron, lime, marl, alum, salt, amber found on the coast near Stolpe, and peat—which latter substance is obtained in enormous quantities, and extensively used for fuel, notwithstanding the abundant supply of wood yielded by the extensive and productive forests.

Linen and woolen fabrics, and leather, rank among the best of the industrial prod-

acts; but the manufactures of Pomerania are not of much importance. The principal branches of industry are agriculture and the rearing of horses and cattle, while the active transport-trade between the neighboring Prussian states and the Baltic ports constitutes a very important source of wealth to the province. The main seat of Pomeranian trade is at Stettin (q.v.), which ranks as one of the most important commercial cities of Prussia.

Pomerania, like every other part of the Prussian dominions, is well provided with educational institutions, and, besides the university at Greifswald, it has thirteen gymnasia, several normal and training schools, and numerous classical and other schools.

Pomerania formed, in the earliest periods of its history, a part of the ancient kingdom of the Wends or Vandals. From the year 1062 it had its own ducal rulers, and in the beginning of the 12th c. it adopted Christianity in consequence of the preaching of bishop Otto, of Bamberg. Bogislaus XIV., who died in 1637, was the last male representative of the Wendish ducal line; and, on his death, the house of Brandenburg laid claim to the whole of the Pomeranian territories, in conformity with a compact which the latter family asserted to have been made between them and the Wendish dukes; but the country having been occupied by the Swedes during the thirty years' war, Prussia was obliged to content itself with the possession of further Pomerania, or *Hinterpommern*, which was assigned to it at the peace of Westphalia, while Sweden retained the remainder of Pomerania, with the island of Rugen (q.v.). After the death of Charles XII., and the subsequent decline of the Swedish power, Prussia was able to make good her asserted claims on the territory of Pomerania at the peace of Stockholm; and in 1720 Sweden was compelled to cede s. Pomerania and the island of Rugen, retaining only a narrow strip of land between Mecklenburg and the Baltic, which was also incorporated with Prussia in 1815, after having been first transferred by Sweden to Denmark as part indemnification for the separation from the latter kingdom of Norway, and subsequently ceded to Prussia by the Danes in exchange for the duchy of Lauenburg, and on the payment of 2½ million thalers to the latter, and of 3½ million thalers to the Swedish government.

POMERANUS, or POMMER. See **BUGENHAGEN**, *ante*.

POMEROY, a city and the co. seat of Meigs co., Ohio; on the Ohio river, 20 m. above Gallipolis, 40 m. s.w. of Marietta; pop. '80, 5,560. Large deposits of salt are found in the vicinity, and the most important industry is its manufacture, for which there are six furnaces. There are also rolling-mills, machine-shops, and flour-mills. Coal is shipped, taken from veins near by.

POMEROY, JOHN NORTON, LL.D., b. New York, 1828; educated at Hamilton college, graduated 1847; studied law, and was admitted to the state bar in 1851. In 1864 he was elected dean of the law faculty of the university of New York, and became professor of law and political science. He remained in this position for four years, and during this time produced his best book, *Introduction to the Constitutional Laws of the United States*, 1868; and *Introduction to Municipal Law*, 1865. The first is used as text-book at West Point, and many colleges and law-schools. In 1869 he returned to Rochester, and has since published *Remedies and Remedial Rights, according to the Reformed American Procedure*, has edited Sedgwick's *Constitutional Law*, and has contributed many articles to the *North American Review*, the *Nation*, and to legal periodicals. He wrote many articles on law for *Johnson's Cyclopaedia*.

POMEROY, SETH, 1715-77; b. Mass.; was maj. of the Massachusetts troops that captured Louisburg in 1745; lieut.col. of the regiment commanded by col. Ephraim Williams, and at his death took command and defeated baron Dieskau; was a delegate to the Massachusetts provincial congress in 1774-75; fought at Bunker hill, and soon after appointed senior brigadier by the continental congress; but in consequence of disputes about military rank, he declined the appointment and retired to his farm.

POMIGLIA'NO D'ARCO, a t. in the province of Naples, Italy, about 8½ m. n.e. of Naples; pop. about 10,000. The vicinity has many times been covered by lava from Vesuvius. There are two very handsome churches, a hospital, and several ancient ruins, among which is one supposed by some antiquarians to be the palace of Pompey alluded to by Cicero.

POMMETÉE, or **POMEL CROSS** in heraldry, a cross whose extremities terminate in single knobs or pomels, like the *bourdon* or pilgrim's staff.

POMOLOGY (Lat. *pomum*, a fruit of any kind, an apple), a term much employed in France and Germany, and to a smaller extent in Britain, to designate the study of fruits and of their cultivation, particularly those of the natural order *pomaceæ* (q.v.). See **FRUIT**, **FRUIT-GARDEN**, **APPLE**, **PEAR**, etc.

POMONA (whose name is obviously connected with *pomum*, "a fruit") was, among the Latins, the patron divinity of garden-produce. The poets, not, perhaps, without some allegorical design, represent several of the rural gods as her lovers—Silvanus, Picus, Vertumnus, etc. Of Vertumnus, in particular, it is related that after he had vainly tried to approach her under a thousand different forms, he at last succeeded by assuming the figure of an old woman. In this guise, he recounted to her the lamentable histories of women who had despised love, and having touched her heart, suddenly trans-

formed himself into a blooming youth and married her. But Vertumnus (connected with *verto*, "to turn," or "to transform") is probably nothing more than a personification of those changes by which plants advance from blossom to fruit. The worship of Pomona, as was natural among a homely race of farmers and shepherds like the ancient Latins, was of considerable importance. Varro tells us that at Rome her services were under the care of a special priest, the *flamen Pomonalis*. In works of art she was generally represented with fruits in her lap, or in a basket, with a garland of fruits in her hair, and a pruning-knife in her right hand.

POMONA, or **MAINLAND**, much the largest and most populous of the Orkney Islands (q. v.), in which group it occupies a central position. It is open to the Atlantic on the w., and to the German ocean on the e., while on the n. Ennhallow and Shapinsha sounds separates it from the islands of Ronsay and Shapinsha, and on the s., Scapa Flow separates it from Hoy and South Ronaldsha. Area, 150 sq. m.; pop. 71, 16,541. It is 25 m. in length, and 15 m. in extreme breadth, but is very irregular in shape. At the town of Kirkwall, the breadth of the island is only about 2 miles. In the w., the shores are bold and elevated, but there is a general slope toward the east. The surface is diversified with hill and lake, and consists in great part of moor and heath. Good pastures are found, however, and in the valleys there is a fertile, loamy soil. Oats, beans, and bere are produced, and sheep and swine are extensively reared. The chief towns are Kirkwall (q. v.) and Stromness (q. v.).

POMPADOUR (JEANNE ANTOINETTE *Poisson*), Marquise de, a notable mistress of Louis XV., was b. in Paris in 1720 or 1722. Her reputed father was a certain François Poisson, who held a humble office in the army-commissariat; but M. le Normand de Tournheim, a rich *fermier-général*, claimed for himself the honors of a dubious paternity, and brought up the little Jeanne as his daughter. She turned out a wonderfully clever child, and M. le Normand spared no pains to give her the best, or, at least, the most stylish education possible. She excelled in such accomplishments as music, elocution, and drawing; but what charmed the brilliant society that frequented the *salons* of the rich financier, was the perfect grace and beauty of her figure, and the exquisite art with which she dressed. A crowd of suitors constantly besieged her, but the one who obtained her hand was her cousin, Le Normay l'Étioles. They were married in 1741. But Mme. l'Étioles, who was constantly told by her infamous mother that she was a "morsel for a king," was careless of her husband's honor and peace. Though he loved her to distraction—and he was a man with whose love any woman might have been content—she, cold, heartless, and ambitious, was scheming day and night to attract the notice of the monarch. Her efforts were after a time crowned with success, and Mme. l'Étioles was installed in the palace of Versailles; she was soon afterward ennobled by the title of marquise de Pompadour, and long ruled the king, first as mistress, and afterward as *amié nécessaire*. One reads with some astonishment of the incessant artifices she had recourse to in order to preserve her influence—the everlasting huntings, concerts, private theatricals, little suppers, and what not—anything to distract the royal mind (surely sufficiently distracted already by nature), and to make it think only of the clever purveyor of gayeties! The private theatricals, in particular, were a great success, and were "got up" every winter from 1747 to 1753—the marquise herself proving a charming actress. The king thought the marquise extremely clever, and, when he ceased to "love" her, was glad to avail himself of her services as his political adviser. In fact, she became premier of France; the council of ministers assembled in her *houdoir*, where the most important affairs of state were settled. The choice of ministers, of ambassadors, of generals, depended on the caprice of a female; the abbé de Bernis, the favorite of a favorite, entered the council. Foreign diplomacy turned the circumstance to account. The Austrian prime-minister induced Maria Theresa to sacrifice her pride to the exigencies of her position, and the empress-queen wrote the courtesan a letter in which she addressed her as *ma cousine*. That word turned the head of the marquise, and changed for a time the foreign policy of France. She died (April 15, 1764) with the reins of government in her hands. During her lifetime, immense sums from the national treasury were paid away to the marquise, and to her brother, created marquis de Marigny. In the years 1762-63 alone, they amounted to 3,456,000 livres. She had numerous houses and lands also given her. In 1853, M. le Roi, keeper of the town-library of Versailles, published in the *Journal de l'Instruction Publique*, a list of the expenses of the marquise de Pompadour during the years in which she had enjoyed the royal favor, which he had found in MS. in the archives of the department of Seine-et-Oise. They amounted to 36,000,000 livres. She was imperious and vindictive beyond measure, and with relentless cruelty doomed to perpetual imprisonment, in the dungeons of the bastille and elsewhere, multitudes who had dared to speak about her ill-gotten gains and power. After facts like these, it is but a poor apology for the marquise to say that she encouraged savans, poets, and philosophers, patronized and protected the *Encyclopédie*, and aided in the expulsion of the Jesuits. The *Lettres* in her name are mostly spurious. See the *Life* by Goncourt (new ed. 1878).

POMPEII, a city of Campania, was built at the mouth of the river Sarnus (*Sarno*), looking out on the bay of Naples. It stood at the base of Mt. Vesuvius, between Herculaneum and Stabia. Of its early history little is known (legend ascribed its

foundation to Hercules); but in more recent times it became a favorite resort for wealthy Romans, many of whom, including Cicero, had villas in the suburbs. It must have been at one time a place of considerable trade, since it was the port-town of Nola and other inland cities which studded the fertile valley of the Sarnus. The city was much damaged by an earthquake which happened on Feb. 5, 63 A.D., and not many years had revolved when the great and final calamity overtook it. In 79 A.D. occurred that terrific eruption of Vesuvius which, in one day, overwhelmed in irremediable ruin the towns of Pompeii, Herculaneum, and Stabiae. In course of time a small village rose at or near the spot; but by and by the memory of Pompeii was forgotten, and for centuries its very site was unknown. The difficulty of discovering its true position was increased in consequence of the changes produced by this fearful convulsion, which had hurled back the Sarnus from its ancient course, and raised the sea-beach to a considerable height, so that the re-discovered city, to which merchantmen resorted of old, is now a mile from the coast, and a considerable distance from the stream that in ancient times was wont to skirt its walls. For more than sixteen hundred years Pompeii lay undisturbed beneath heaps of ashes and cinders. At length, in 1689, some ruins were noticed, but it was not till 1755 that any excavations were made. These operations, begun by the Neapolitan government, have been continued till the present time (and recently with increased energy), and have been exceedingly productive of objects which interest the antiquarian and the classical scholar. The remains found are in a remarkably good state of preservation, owing to the fact that the city was destroyed not by lava, but by showers of sand, ashes, and cinders (*lapilli*), forming a light covering, which found its way into every nook, and, as it were, hermetically sealed up the town. It would appear that in some parts at least the matter was deposited in a state of liquid mud, and so flowed into the remotest cellars of the doomed habitations. This is proved by the discovery of the skeleton of a woman "inclosed in a mold of volcanic paste, which retained a perfect impression of her form." It suggested to signor Fiorelli, the director of the excavations, the idea of filling up the molds with liquid plaster, and obtaining casts of the forms they contained. Many interesting objects recently discovered have thus been preserved. Among recent excavations are several paintings of classical subjects, one of which, the Laocoon, excavated in 1875, is a most valuable specimen of ancient art. That the superincumbent rubbish, in most places about 15 ft. deep, is the accumulation of several eruptions is proved by the facts: that as many as eight or nine different layers have been distinctly counted; and that, while the upper layers are undisturbed, the lower one has evidently been moved. The comparatively few skeletons found, and the almost entire absence of objects of great value, as gold and silver plate, show that most of the inhabitants (estimated at 20,000) escaped and returned to bury their dead, and recover their treasures. In the autumn of 1864, upward of two hundred skeletons were found in a temple of Juno, the victims having evidently gone thither to seek the protection of the goddess. Only about one third of the city has as yet been excavated. The plan of Pompeii seems to have been regular, the narrow streets crossing one another at right angles. The houses were plain and seldom more than two stories high, and had all their good apartments on the ground-floor. The walls are about two miles in circumference. It would be impossible in our brief space to attempt even an enumeration of the objects discovered in this now famous city. Suffice it to say that in all the departments of social life—in the affairs of domestic and of public life, of the worship of the gods, and the shows of the arena—in architecture, painting, and sculpture—in fine, in all the appliances of comfort and of luxury in a wealthy community, we have, as it were, a living picture of a city 1800 years ago. The reader who wishes fuller information should consult Mazois's work, *Les Ruines de Pompeii* (Paris, 1812-35); Breton's *Pompeia* (Paris, 1855); Overbeck's *Pompeji in seinen Gebäuden, Alterthümern und Kunstwerken* (3d ed., Leip. 1875); sir W. Gell's well-known *Pompeiana* (4 vols. 1824-30); and *Pompeii: its History, Buildings, and Antiquities*, by T. H. Dyer (1875). For a popular account of the state of Pompeii some years ago, we may refer to *Something of Italy*, by W. Chambers (1862).

POMPELMOOSE, or **POMELO**, *Citrus pomelmoor*, a fruit nearly resembling the shaddock (q.v.), of which, perhaps, it ought to be esteemed a variety, although it is now distinguished by some botanists as a separate species. It is large and pale yellow. It has long been cultivated in the East Indies, and has recently been introduced into many warm countries. It has become an article of importation into Britain, and is frequently to be seen in fruit-shops. In pleasantness of taste it resembles the best oranges. It is often preserved with wine and sugar, when it is very agreeable and refreshing in a hot climate. The rind is often candied.

POMPEY THE GREAT. Cneius Pompeius Magnus, son of Cneius Pompeius Strabo, was born in 106 B.C. At the early age of 17 he began to learn the military art under his father by service in the field against the Italians in the Social war. Though so young, he gave proof of extraordinary valor and of remarkable energy of character. On the death of his father in 87 B.C., when he was only 19 years of age, he was left without a protector, and during the temporary triumph of the Marian party, he was for some time in considerable danger. When Sulla, to whose side he was attached, returned from Greece to Italy to oppose Marius, Pompey hastened into Picenum, where he had con-

siderable estates and influence, and there raised an army of three legions, with which he successfully opposed the forces of the Marian party, compelling them to quit the district, and effecting a junction with Sulla. During the rest of the war he behaved with great prudence and valor, and with such remarkable success, that, on the restoration of peace in Italy, the conduct of the war against the remains of the Marian faction in Africa and Sicily was intrusted to him. He speedily performed his commission, and on his return to Rome was honored with the name of *MAGNUS* (i.e., "the great"), and with a triumph, which, for one who had not yet held any public office, and was merely an *eques*, was an unprecedented distinction. His next exploits were the reduction of the followers of Lepidus, whom he drove out of Italy, and the extinction of the Marian party in Spain, led on by the brave Sertorius. This latter work was one of no small difficulty. Pompey suffered some severe defeats at the hands of Sertorius, and it was only after Sertorius had been assassinated that he was able to put an end to the war. In returning to Italy after an absence of five or six years in Spain, he fell in with and defeated the remnants of the army of Spartacus, and thus claimed the credit of concluding the Servile war. He was now the idol of the people, and though legally ineligible to the consulship, was elected to that important office for the year 70, the senate relieving him of his disabilities rather than provoke him to extremities. Hitherto Pompey had belonged to the aristocratic party; but, as he had of late years been looked upon with suspicion by some of the leading men, he publicly espoused the people's cause. He carried a law restoring the tribunician power to the people, and aided largely in introducing the bill of Aurelius Cotta (*lex Aurelia*), that the *judices* should for the future be taken from the *senate*, the *equites*, and the *tribuni aerarii*, instead of from the senate alone. In 67-66 B.C. Pompey performed a noble service to the republic in clearing the Mediterranean of the pirates who infested it in immense numbers; and during the next four years, 65-62, he conquered Mithridates, king of Pontus, Tigranes, king of Armenia, and Antiochus, king of Syria. At the same time he subdued the Jewish nation, and captured Jerusalem. On his return to Italy he disbanded his army, and entered Rome in triumph for the third time in 61 B.C. And now his star began to dim. Henceforward we find him distrusted by the aristocracy, and second to Cæsar in popular favor. After his return he was anxious that his acts in Asia should be ratified by the senate, and certain lands apportioned among his veteran soldiers. But the senate declined to accede to his wish, and he therefore formed a close intimacy with Cæsar, who promised to secure for him the accomplishment of his objects, if he in turn would assist Cæsar in the attainment of *his* aims. Crassus, who possessed enormous wealth, and who in consequence exercised a wide influence at Rome, was induced to forego his grudge to Pompey, and thus these three men formed among themselves that coalition which is commonly called "the first triumvirate," and which for a time frustrated all the efforts of the aristocratic party. This small oligarchy carried all before them; Pompey's acts in Asia were ratified; Cæsar's designs were all gained; his agrarian law, distributing land in Campania among the poorer citizens was passed, and thus, too, Pompey's promises to his troops were fulfilled. Cæsar's daughter, Julia, was given in marriage to Pompey, and private relationship was thus made to bind tighter the tie of political interest. And now, for some years following, Cæsar was reaping laurels in Gaul, and rising higher in popular esteem as a warrior and statesman, while Pompey was idly wasting his time and his energies at Rome. But Pompey could not bear a rival. Jealousies sprang up; Julia died in 54 B.C., and thus father-in-law and son-in-law were sundered by a yet wider gulf, which no bridge could span. Pompey now returned to his former friends, the aristocracy, whose great desire was to check Cæsar's views, and strip him of his command. Cæsar was ordered to lay down his office and return to Rome, which he consented to do, provided Pompey, who had an army near Rome, would do the same. The senate insisted on an unconditional resignation, and ordered him to disband his army by a certain day, otherwise he would be declared a public enemy. To this resolution two of the tribunes in vain objected; they therefore left the city and cast themselves on Cæsar for protection. It was on this memorable occasion that he crossed the Rubicon, and thus defied the senate and its armies, which were under Pompey's command. The events of the civil war which followed have been recorded in the life of Cæsar (q.v.). It remains only to mention, that after being finally defeated at Pharsalia in 48 B.C., Pompey escaped to Egypt, where, according to the order of the king's ministers, he was treacherously murdered by a former centurion of his own, as he was landing from the boat. His head was cut off, and afterward presented to Cæsar on his arrival in Egypt. But Cæsar was too magnanimous to delight in such a sight. The murderer of Pompey was, by his orders, put to death. The body lay on the beach for some time, but was at length buried by a freedman, Philippus, who had accompanied his master to the shore.

POMPEY, *SEXTUS*, B.C. 75-35; second son of Pompey the great, and called Pompey the younger; celebrated in Roman history for his resistance to Antony and Octavian. Hearing of the death of his father he fled, finally escaping to the borders of the Lacedæmoni, and rallying in the mountain fastnesses a gang of banditti. He applied to the Roman senate for the restitution of his father's property which had been confiscated. He received a large sum of money from the public treasury, and the title of commander of the seas. Marching southward he crushed all opposition, took possession of Bœtica,

and assumed the state and authority of a sovereign. When he learned, B.C. 43, that a second triumvirate was formed, and that he was among the proscribed, he resorted to piracy, his mariners boarded traffickers, and Corsica, Sardinia, and Sicily fell into his power. Rome was reduced to the point of starvation by his interception of their cornships: the people compelled Antony and Octavius to negotiate a peace. A treaty was concluded advantageous to Sextus. Sicily, Sardinia, Corsica, and Achaia were given him, and he was promised the consulship the following year. But hostilities were soon resumed, and in 36 a Roman squadron under Agrippa destroyed his fleet off Naulochus. Pompey fled, but after a few months was overtaken by Titus, carried to Miletus, and put to death.

POMPEY'S PILLAR. The name of a celebrated column standing in the neighborhood of Alexandria. It stands upon an eminence about 1800 ft. s. of the walls. It is a monolith of red granite, and of the Corinthian order, and stands upon a pedestal. Its total height is 98 ft. 9 in.; shaft, 73 ft.; 29 ft. 8 in. in circumference. The shaft is well executed. On the summit is a circular depression for the base of a statue, which in some old drawings is represented standing on it. The name popularly applied to it of Pompey's pillar is an erroneous appellation given by ancient travelers, who confess they do not know whence it was derived, and still retained. The inscription on the base, however, shows that it was erected by Publius, prefect of Egypt, in honor of the emperor Diocletian, who is styled upon it "the invincible;" and it is supposed to record the conquest of Alexandria by Diocletian, 296 A.D., and the suppression of the rebellion of the pretender Achilles. It appears to have been in the vicinity of a circus, forum, or gymnasium. The obelisk stood upon some fragments of Egyptian monuments of remote antiquity, consisting of a piece with the name of a monarch of the 13th Egyptian dynasty, and another with that of Psammitichus I., the former of which is now in the British museum.—Wilkinson's *Modera Egypt*, i. p. 149 and foll.; White, *Aegyptiaca*, p. 1, and foll.; Champollion-Figeac, *L'Egypte*, p. 472; Norden, i. p. 22.

POMPONIUS MELA. See MELA, *ante*.

PONANI, or PANIANI, a seaport t. of British India, in the district of Malabar, on the s. side of an estuary of a river of the same name, about 600 m. s.e. from Bombay. The river is navigable only for canoes to the distance of 63 m. from the sea. The population is employed in fishing and in trade, having numerous patemars, or sea-going boats. Ponani was formerly a much more considerable place, until nearly ruined by the oppression of Tippoo sultan. Under the system of railways by which the Madras territories are traversed, the eastern and western coasts of this part of the peninsula have been united by a line from Ponani to Madras. Pop. '72, 11,472.

PONCAS, a tribe of Dakota Indians, originally a part of the Omahas. They formerly lived on the Red River of the North, but were constantly attacked by the Sioux, who drove them from place to place, until greatly reduced in numbers, when they left the region of the Missouri and settled on the Ponca river, where they built a fortified village. In Mar., 1855, they sold their land to the government, a valuable tract lying between Iowa creek and White river. They removed to a reservation near the Yanktons; here they were again attacked by the Sioux, which disturbance, accompanied by the failures of their crops, caused them to become dissatisfied, and a new treaty was made in Mar., 1855, which gave them 756,000 acres of land near the mouth of the Niobrara river, from which they were afterward transferred to the Indian territory, where a majority now (1881) remain, though allowed to return to Dakota if they prefer.

PONCE DE LEON, FRAY LUIS, a celebrated Spanish poet, was b. in 1527, probably at Granada. In 1544 he entered the order of St. Augustine, at Salamanca, where he studied, took his degree in theology in 1560, and was appointed professor of the same in 1561. The reputation that he acquired as a learned commentator on the Bible induced some persons, who were envious of his success, to accuse him of having disregarded the prohibition of the church, inasmuch as, at the request of a friend, he made a new translation of the Song of Solomon, and brought out prominently, in his arrangement of the verses, the true character of the original—viz. that of a pastoral eclogue. This interpretation was not that adopted by the Catholic church, and Ponce de Leon was summoned, in 1572, before the formidable tribunal of the inquisition at Valladolid to answer the charges of Lutheranism, and of translating the sacred writings contrary to the decrees of the council of Trent. The first accusation he quickly disposed of—for he had in reality no inclination to a foreign Protestantism; but the second was undoubtedly true, and Ponce de Leon was imprisoned. After five years he was released through the intervention of powerful friends, and was even reinstated in his chair at the university with the greatest marks of respect. The numerous auditory that assembled to witness the resumption of his lectures were electrified when Ponce de Leon began with these simple words, "As we observed in our last discourse"—thus sublimely ignoring the cause and the duration of his long absence from his lecture-room. In 1580 Ponce de Leon published a Latin commentary on the Song of Solomon, in which he explained the poem directly, symbolically, and mystically; and, therefore, as obscurely, says Mr. Ticknor, "as the most orthodox could wish." Ponce de Leon lived 14 years after his restoration to liberty, but his terror of the inquisition never quite left him, and he was very cautious

in regard to what he gave to the world during his lifetime. He died in 1591. Ponce de Leon's poetical reputation was wholly posthumous, for though his *De los Nombres de Christo* (On the Names of Christ) (Salamanca, 1583-85), and *La Perfecta Casada* (The Perfect Wife) (Salamanca, 1583), are full of imagery, eloquence, and enthusiasm, yet they are in prose. His poetical remains were first published by Quevedo at Madrid in 1631, under the title, *Obras Proprias, y Traducciones Latinas, Griegas, y Italianas; con la Paraphrasa de Alynos Salmos y Capítulos de Job*, and have since been often reprinted. These consist of translations from Virgil's *Eclogues* and the *Georgics*; from the *Odes* of Horace, and other classical authors, and from the Psalms. His original poems are few, but they are considered among the most precious in the author's language, and have given Ponce de Leon a foremost place among the Spanish lyrists. According to Ticknor, "Luis de Léon had the soul of a Hebrew, and his enthusiasm was almost always kindled by the reading of the Old Testament. Nevertheless, he preserved unaltered the national character. His best compositions are odes composed in the old Castilian versification, with a classic purity and a vigorous finish that Spanish poetry had never till then known, and to which it has with difficulty attained since." See Nicholas Antonio, *Bibliotheca Hispana Nova*; Ticknor, *History of Spanish Literature*; and Villemain, *Essais sur la Poésie Lyrique*.

PONCE DE LEON, JUAN, 1460-1521; b. Spain; belonged to an ancient family, and was a page to Ferdinand V., and also served in the wars against the Moors of Granada. He sailed with Columbus on his second voyage to Hispaniola in 1493, and became commander of the eastern province. In 1508 he sailed on an expedition to Porto Rico, and a year later, having conquered the island, became governor of it, and ruled with great rigor until his removal, which was effected through the influence of the family of Columbus. In 1512, advanced in years, but with his love of adventure still unquenched, he sailed from Porto Rico in search of the mythical fountain of youth, which was supposed to exist in the Bahamas, whither Ponce de Leon sailed, and having failed in finding it, set sail for Florida, where he arrived on Easter Sunday. The banks were covered with beautiful foliage intermingled with flowers, and he took possession of the peninsula in the name of his sovereign, and called it Florida. He still continued his search for the famous fountain along the coast, and also on the Tortugas, and finally returned to Porto Rico, leaving another to continue the search. He returned to Spain in 1513, and received the appointment of governor of Florida, and in 1521 undertook to colonize it, but being wounded by one of the natives, returned to Cuba, where he died.

PONCHO, an important article of male attire in Chili. It consists of a piece of woolen cloth, 5-7 ft. long, 3-4 ft. broad, having in the middle a slit through which the wearer passes his head, so that the poncho rests upon the shoulders, and hangs down before and behind. In the fashions of recent times, the poncho has been introduced in Europe.

POND, ENOCH, D.D., b. Mass., 1791; graduated at Brown university, 1813; studied theology with Dr. Emmons; was ordained in 1814, and settled as pastor of the Congregational church at Auburn, Mass., where he remained until 1828, when he became co-conductor of the *Spirit of the Pilgrims*, a monthly religious magazine in Boston. In 1832 he was elected professor of theology in the seminary at Bangor, Me.; in 1856 became president of the institution, professor of ecclesiastical history, and lecturer on pastoral duties. He has published reviews of *Judson on Baptism*; *Monthly Concert Lectures*; *Memoirs of President Davies*; *Memoir of Susanna Anthony*; *Memoir of Count Zuisendorff*; *Memoir of John Wickliffe*; *Morning of the Reformation*; *No Fellowship with Romanism*; *The Young Pastor's Guide*; *The Mather Family*; *The World's Salvation*; *Pope and Pagan, or Middleton's Celebrated Letters*; *Sveedenborgianism Reviewed*; *Plato: his Life, Works, Opinions, and Influence*; *Review of Bushnell's God in Christ*; *The Ancient Church*; *Memoir of John Knorr*; *Lectures on Christian Theology*; *Lectures on Pastoral Theology*; *Sermons*; and numerous articles in the *Bibliotheca Sacra*, *Biblical Repository*, and many other periodicals.

POND, JOHN, studied at the Maidstone grammar-school, and at Trinity college, Cambridge. Having, on account of ill-health, spent several years abroad, he settled on his return at Westbury, near Bristol, where he remained till 1807. While here he made observations proving that the quadrant then at Greenwich for the determination of declinations had changed its form since the time of Bradley in 1750, a result which Troughton verified by actual measurement. In 1807 he returned to London, and in 1811 succeeded Dr. N. Maskelyne as astronomer royal. He is the inventor of the method of observing in groups, and was the first astronomer who advocated what is now the universal practice of depending on masses of observations for all fundamental data. In 1833 he completed a standard catalogue of 1113 fixed stars. His works are the volumes of the Greenwich observatory, published during his astronomical career; various papers in the *Transactions* of the royal and royal astronomical societies; translation of the *Système du Monde* of Laplace. He received a pension in 1835.

PONDICHERRY, the chief of the French settlements in India, situated in the district of South Arcot, in the Madras presidency. The other French establishments are Mahé in Malabar, Karikal (q.v.) in Tanjore, Yanam in Godavari, and Chandernagore (q.v.) in

Bengal. The extent of the united territories is given by M. Block at 188 sq. miles. Pondicherry is situated on the Coromandel coast in $11^{\circ} 56'$ of n. lat., and $79^{\circ} 54'$ of e. long., and is 88 m. from Madras. The territory of Pondicherry is divided into three districts—Pondicherry, Vellenore, and Bahour—has an area of 107 sq. m., and comprises 92 villages. The total population of the French establishments in India in 1840 was reckoned at 171,217; in 1876 it amounted to 285,022. The population of the town of Pondicherry is about 50,000. Its exports (indigo, cotton, skins, nuts, oils, etc.) and imports amount in value to about £600,000 annually. Pop. of district of Pondicherry about 90,000. The town stands on a sandy plain, and is divided by a canal into a European and a native town. It has a handsome square, where are the governor-general's house, the Catholic cathedral, and the bazaar. In Pondicherry is the high court for the French possessions in Asia, a European college, and an Indian school. The open roadstead is defended by a citadel, and possesses a light-house; and from it mail steamers sail for Europe, Madras, etc. The governor of Pondicherry is governor-general of the French possessions in India. The spinning of cotton and the fabrication of cotton-thread are the chief manufactures in French establishments.

History.—The first settlement of the French in India was at Surat, in 1668. The chief of the French East India company at that time was Carou. Subsequently he took Trincomalee from the Dutch; but they were not long in repossessing themselves of it. Carou then turned to the Coromandel coast. In 1672 he took from the Dutch St. Thémé, a Portuguese town (now a suburb of Madras); but two years later the Dutch retook this place also. It was then that François Martin collected about 60 Frenchmen and settled them in Pondicherry, which, in 1674, he had purchased, with the surrounding territory, from Giugee, who had the supervision of all Sivaje's conquests in the country. The Dutch took the town in 1693; but by the treaty of Ryswick it was restored to the French in 1697. Chandernagore was ceded to the French in 1688 by Aurungzebe. In 1727 they obtained the cession of Mahé; in 1739 they purchased Karikal from the king of Tanjore; and in 1752 Yanaon was ceded to them. Dupleix was governor of Pondicherry when war broke out between France and England, and in 1746 La Bourdonnais took Madras. In 1748 admiral Boscawen besieged Pondicherry, but two months later, was compelled to raise the siege. In the same year occurred the peace of Aix la Chapelle; but it did not put an end to hostilities in India till some time later. In 1757 war recommenced. In 1758 count de Lally became governor-general, and attacked the English settlement of fort St. David, which surrendered, and was totally destroyed. In 1761 Eyre Coote took Pondicherry. By the peace of Paris Pondicherry was restored to the French in 1763 with reduced territory, and also Mahé, Karikal, and Chandernagore. Pondicherry was again taken by the English under sir Hector Monro in 1778, and restored in 1783. In 1793 the English again repossessed themselves of it, but the treaty of Amiens in 1802 again restored it, but only till the following year. From this time it was held by the English till, by the treaties of 1814 and 1815, it was for the last time restored to France, reduced to the narrow limits assigned by the treaty of 1783.

Annexed is a statement exhibiting some particulars relative to such of the present French possessions in India subordinate to Pondicherry as are not noticed separately in this work:

YANAON, in the Godavari district, in $16^{\circ} 43'$ n. lat., and $83^{\circ} 11' 16''$ e. long., about 24 m. s. of Rajahmundry. The area is about 13 sq. miles.

MAHÉ in the Malabar district, in $11^{\circ} 42'$ n. lat., and $75^{\circ} 36' 16''$ e. long. The area is only about 2½ sq. miles.

POND LILY. See WATER LILY (*ante*).

PONDWEED, *Potamogeton*, a genus of plants of the natural order *naiades*, having hermaphrodite flowers, sessile upon a spike or spadix, which issues from a sheathing bract or spathe, a perianth of four scales, four sessile anthers opposite to the scales of the perianth, four pistils, which become four small nuts, and a curved embryo. The species abound chiefly in the rivers, lakes, and ditches of Britain and continental Europe, but they are found also in other parts of the world, and some of them in New Holland. They often present a beautiful appearance in clear streams and ponds, where they protect the spawn of fish and harbor aquatic insects, their seeds also affording food to aquatic birds. The roots are a favorite food of swans. Some of the species have the leaves all submersed, others have some of their leaves floating, and considerably different in form from the submersed leaves.

PONGO, *Simia* or *Pithecus* *Wormbii*, an ape of the same genus with the orang (q.v.), but of much larger size, 6 ft. or more from the heel to the crown of the head, and covered with black hair, with which dark red hair is mingled. It is a native of Borneo, Sumatra, and probably of other neighboring islands, inhabiting the deepest recesses of the forests, and much more rarely seen by man than its congener the orang, which was at one time supposed by the most eminent naturalists to be the same species in a younger state. It is sometimes called the black orang. It has a very prominent muzzle, a large mouth, the face nearly naked, except the lower part, which has a beard. Little is yet known of the habits of the pongo. It is believed to feed chiefly on fruits. It possesses great strength, and, like the orang, is evidently adapted by its conformation for moving chiefly among the boughs of trees.

PONIATOWSKI, a celebrated princely family of Poland, is of Italian origin, being directly descended from the family of the Torelli, whose ancestors were counts of Guastalla. One of the Torelli family having settled in Poland, assumed the name of Poniatowski from his wife's estate of Poniatow in that country. Those of the Poniatowski family who make a figure in history are **PRINCE STANISLAS PONIATOWSKI**, who, in the war of succession to the kingdom of Poland, joined Charles XII. of Sweden in supporting Stanislas Leszczyński; his sons, Stanislas-Augustus, the last king of Poland (q.v.) and **ANDREW**, who rose to great distinction in the Austrian service; and Andrew's son, **JOSEPH-ANTONY, PRINCE PONIATOWSKI**, the celebrated Polish chief in the army of Napoleon. Joseph-Antony was born at Warsaw, May 7, 1762, and at the age of 16 entered the Austrian army, with which he made the Turkish campaign of 1787, and rose to the rank of col. of dragoons. In 1789 he returned to Poland, and was named commander-in-chief of the army of the south, having under him Kosciusko, Wielhorski, Lubomirski, and other celebrated leaders. His army, though much inferior in numbers to that of Russia, which, in 1792, invaded the country, gained the brilliant victories of Poloné and Zielencé; but Poniatowski's uncle, king Stanislas, by agreeing to the convention of Targowitz (q.v.), put an end to the contest in 1793. The prince then resigned his command, and went into voluntary exile; but returned in the following year to aid Kosciusko, now dictator, in his fruitless opposition to the third partition of Poland. On the proposal of Napoleon to reconstitute the kingdom of Poland, Poniatowski joined the French (1800) at the head of a Polish army, and did good service against the Russians at the battles of Golymin, Dantzig, and Friedland; but the French emperor, by the treaty of Tilsit, handed over Poland to its enemies, and only the duchy of Warsaw (nominally subject to the king of Saxony) was left intact. Poniatowski was appointed generalissimo and commander-in-chief for the duchy; and so zealously did he labor for the development of its military resources, that, in 1809, when the war between France and Austria was resumed, he was able to drive the Austrians out of the Polish territory, and overrun a considerable part of Galicia. He continued to administer the military affairs of the duchy till 1812, when he joined the French army, destined to invade Russia, with a Polish army of 100,000 men. But, to his intense disgust, the greater part of his army was broken up into detachments, which were incorporated with the various French legions, and Poniatowski was left with not more than 20,000 men under his direct command. At the head of this division, which always composed the extreme right of the French army, Poniatowski gathered innumerable laurels on the battle-field, and at the storming of the Russian fortresses; but he was so severely injured at Smolensko during the retreat that he was obliged to return to Warsaw (Dec., 1812). In the following autumn he resumed his old place in the French army, and on Oct. 16, received from the emperor the dignity of marshal of France, an honor, in his own estimation, much inferior to that of "generalissimo of the Poles," which he already possessed. After the defeat at Leipsic (q.v.), Poniatowski was left with the remnant of his Polish division to protect the French retreat, which he accomplished by keeping the Prussians in check for several hours; at last, when his force was reduced to 300 men with 30 horses, and himself severely wounded, he retreated over the Pleisse, swimming his horse through the river; but, in attempting similarly to cross the Elster, exhausted nature could no longer bear up, and he sank to rise no more, Oct. 19, 1813. His body was recovered six days after, and was embalmed and carried to Warsaw, whence it was afterward removed to Cracow, and placed beside the ashes of Sobieski and Kosciusko.

PONSARD, FRANCIS, 1814-67. A French dramatist b. in Vienna; educated for the bar, with tastes for poetical literature. In 1837 he translated Byron's *Manfred* into French, but it found few readers. While residing several years in Vienna he contributed to the *Revue de Vienne*. His first approved production was *Lucrèce*, which was hawked through Paris to find a reader among the literary judges for the stage in 1843, and finally in 1853 got a hearing through the friendship of Charles Renaud. Theatrical rivalries aided to secure it a brilliant reception, and it has since maintained its place among the best productions for the French stage. In 1846 he produced *Agnes de Méranie*, which was coldly received; in 1850 *Charlotte Corday*, which was popular; and followed that by a comedy entitled *Horace et Lydie*, which was completely successful. In 1853 his *L'Honneur et l'Argent* was brought out at the Odéon and had an unexampled run of popularity. It was remarked as forming an era in Parisian taste that a piece so pure and high in its tone should have a reception so continuously warm—it having run more than 100 consecutive nights without losing interest with the public. The poetic talent displayed in it is not of a high order; but in grace of diction, sustained interest, and intense sympathy created with the moral of the play, it is remarkable. In 1856 he produced the comedy *La Bourse*, an excellent satire on the rage for speculation then just reaching fever heat in Paris; in 1866 the *Lion Amoureux*; and in 1867, shortly before his death, *Galilée*. Ponsard was a member of the academy in 1855 soon after the pronounced success of *L'Honneur et l'Argent*.

PONT-À-MOUSSON, a t. of France, department of Meurthe-et-Moselle, on the railway from Nancy to Metz, 20 m. n.n.w. of the former of these towns. The Moselle flows through the town, which is situated in a fruitful valley. There is a fine Gothic church

dedicated to St. Martin. Pont-à-Mousson has large cavalry barracks, and some manufactures of pottery. Pop. '76, 9,904. It was the birthplace of marshal Duroc, the favorite and friend of Napoleon.

PONTASSIE'VE, a t. of Italy, province of Florence, in a picturesque situation, at the junction of the Sieve with the Arno, 12½ m. e. of the city of Florence; is a walled town with well-kept streets, a handsomely decorated square, and a large church. The inhabitants are engaged chiefly in agricultural pursuits, and at its fairs all the rich products of Tuscany are profusely displayed.

PONTCHARTRAIN, LAKE, in Louisiana, about 5 m. n. of New Orleans, with which it communicates by a canal, is 40 m. long, and 24 m. in extreme width. It is navigated by small steamers, and communicates on the e. with the gulf of Mexico, and on the s. with the Mississippi. Its greatest depth is from 16 to 20 feet.

PONTECORVO, a city of southern Italy in the province of Caserta, situated on the river Garigliano, 37 m. n.w. of Capua, with 10,020 inhabitants, almost all engaged in agriculture. It has an old castle, many churches, and is a bishopric. It formerly belonged to the pope; but now, since 1860, it forms part of the kingdom of Italy, and is a sub-prefecture. Napoleon I. gave the title of prince of Pontecorvo to marshal Bernadotte, afterward king of Sweden.

PONTE DA. See **BASSANO**, *ante*.

PONTE DELGA DA, a t. on the s. coast of the island of St. Michael, one of the Azores (q. v.), in lat. 37° 40' n., and long. 25° 36' west. It is defended by the castle of St. Braz, which can mount 90 pieces of cannon, and by the forts of Sao Pedro and Rosto de Cao. The anchorage in the roadstead is bad and the harbor is shallow, but still the trade (which is largely in the hands of English merchants) is the most considerable of all the towns in the Azores. The chief exports are wheat, maize, and oranges. Pop. estimated differently from 16,000 to 22,000.

PONTEDE'RA, a t. in the province of Pisa, Italy, near the junction of the Arno and Era rivers, 13 m. n.e. of the city of Pisa; pop. about 11,000. In the middle ages its possession was the subject of fierce contention between Florence and Pisa, and it was then a walled and strongly fortified place. It is now an important manufacturing place, and the weaving of woolen and cotton cloth is the chief industry.

PONTEFRACT (commonly pronounced *Pomfret*), a market t. and municipal and parliamentary borough, in the county of York, and 24 m. s.s.w. of the city of that name, on the Lancashire and Yorkshire railway. There are two churches, viz., St. Giles and All-Saints; the latter is in the early English style, and has a handsome tower. There are a grammar, as well as national and other schools, several alms-houses, a large work-house built in 1864, a splendid market hall opened by lord Palmerston in 1860, etc. In the vicinity are extensive gardens and nurseries. Eight fairs for the sale of cattle take place annually. The trade is chiefly in corn, licorice, and malt. Two members are returned to the house of commons for the borough. Pop. '71 of municipal borough, 5,350; of parliamentary borough, 11,653.

The castle of Pontefract, built shortly after the conquest, was a large and strong edifice, and stood on a commanding height. It was the scene of the imprisonment and death of Richard II., and here also Rivers, Grey, and Vaughan were put to death, at the instigation of Richard III. The remains of the castle to be seen at the present day are very meager.

PONTEFRACT CAKES are small lozenges of refined licorice, which have for centuries been made at Pontefract, and are much esteemed. They are impressed with a rude figure of a castle, intended to represent Pontefract castle.

PONTEVEDRA, a t. of Spain, in Galicia, is situated on a peninsular slope near the mouth of the river Lerez, 35 m. s. of Santiago. Pontevedra is a clean and pretty place, with high old walls, granite-built houses, broad streets, and pleasant arcades. It takes its name from the bridge (*Pons Vetus*) that spans the river. The Pontevedrans are engaged chiefly in agriculture, though sea-fishing is also carried on, and there are some manufactures. Pop. 4,800. The neighborhood, of which charming views are obtained from parts of the town, is covered with villas, farms, and woodlands.

PONTIAC, the co. seat of Oakland co., Michigan, 26 m. n.w. of Detroit, on the Clinton river, and the Detroit and Milwaukee railroad; pop. '70, 4,367. It has churches, schools, 3 banks, and 3 newspapers. Among the public buildings are a court-house, the high school, a state reform school, and an insane asylum, erected in 1877 at a cost of almost \$500,000. It has a large export trade in wool, wheat, and flour. There are planing mills, foundries, flour mills, etc.

PONTIAC, a co. in n.w. Quebec, Canada, on the Ottawa river; about 20,000 sq. m.; pop. '71, 16,457. The surface is diversified and heavily wooded. Large quantities of lumber are made. Co. seat, Bryson.

PONTIAC, 1720-69; b. near the Ottawa river, chief of the Ottawas, an Algonquin tribe of Indians. He was an early ally of the French, and in 1764 defended Detroit against the attacks of other Indian tribes, and it is thought he assisted in the defeat of

Braddock in 1755. In 1762, incensed at the English for having gained a victory over the French, and perhaps foreseeing the extermination of his people, he determined on their overthrow, and formed a conspiracy to murder them or drive them from the country w. of the Alleghanies, and invited the various tribes to join him. The conspiracy was well planned, and so quietly arranged that no suspicion of it arose until the first blow had been struck, June, 1763; within two weeks all the English garrisons and trading posts w. of Oswego, excepting Niagara, fort Pitt, and Detroit, fell into his hands. He then with his followers besieged Detroit for nearly a year, but, col. Bradstreet receiving re-enforcements, the Indians were forced into submission, and the chiefs of the hostile tribes sued for pardon and peace; Pontiac alone remained unconquered, and retired to the country of the Illinois. During the siege of Detroit, in order to buy supplies for his followers, Pontiac issued bills of credit written on birch-bark, with a picture of an otter for signature; these notes were taken by the French, and afterward redeemed by Pontiac. Once more he endeavored to arouse the Indians to rebellion, and sought the assistance of the French as well as of Indian tribes, but failed, and in 1766, his power being gone, he submitted to English rule. He was murdered in 1769 in Cahokia, a village on the Mississippi, near St. Louis, by an Indian who had been bribed to do the deed by an English trader.

PONTIANAK, the capital of the kingdom of the same name on the w. coast of Borneo, is situated near the junction of the Landak and Kapuas. It is built on both banks of the river, which is 900 ft. broad, and thence to the sea is called the Pontianak. The city derives its importance from being the seat of the Netherlands' resident, who rules directly and indirectly over the whole w. coast, from 2° 56' s. to 2° 50' n. lat., and 108° 45' to 112° 50' e. long.; territories rich in vegetable and mineral wealth. The residency house is near fort Du Bus, in 0° 2' n. lat., and 109° 1' 20" e. long.; other principal buildings being the sultan's palace, the mosque, and hospital. Pop. 7,000, including 2,000 Chinese. Trade is the only pursuit in the town; and the rich alluvial lands are partly cultivated with rice, sugar-canes, cotton, indigo, coffee, provisions, and fruits.

Besides a number of small dependencies, the Netherlands' resident at Pontianak governs the important kingdoms of Landak, Mampawa, and Sambas, with the mining district of Montrado, in the n.; Tayang, Simpang, and Matan or Succadana, to the s.; and Sangouw, Sekadouw, and Singtang, in the interior. The produce consists of diamonds, gold, coal, tin, iron, wax, edible nests, pepper, gutta-percha, etc. There are many gold mines in Montrado and other districts; rich iron ores in Matan; gold, platinum, copper, etc., in Sambas; and in former times Landak was rich in diamonds, but the produce is now trifling. In this district was found the famed diamond of the sultan of Matan, which weighed 367 carats. The annual produce of the mines in the residency of Pontianak is estimated at not less than 425,000 ounces of gold. In 1873, pop. 365,881, of whom 142 were Europeans, 24,997 Chinese, 90,128 native Malays, 248,798 Dyaks, etc.

In 1872 the Dutch imports and exports were: imports, £182,212, and exports, £178,833. Vessels above 10 tons burden, belonging to the w. division of Borneo, 62, amounting to 1680 tons. The other Netherlands possessions in Borneo are called the residency of the s. and e. division, including the lands from Matan, in the s.w., along the s. and e. coasts to 0° 50' n. lat. The resident's house is at Banjermassin, on the island of Tatas, 15 m. from the mouth of the Banjar, in 3° 34' 40" s. lat., and 114° 30' e. long. Pop. 30,000. The exports are—pepper, diamonds, gold-dust, coal, benzoin, wax, rattans, dragon's blood, camphor, edible nests, iron, fire-arms, etc. Imports—piece-goods, powder, knives, opium, rice, salt, sugar, Chinese porcelain, silk-stuffs, coral, pearls, etc. In 1874 the coal-mines of Orange-Nassau produced 3,637½ tons. On the e. coast there is also coal, and the sultan of Kutei delivers it, according to contract, for the use of the Dutch navy, at £1 per ton. During 1872, the imports of the s. and e. residency amounted to £229,025, and the exports to £120,461. The vessels above 10 tons belonging to it numbered 30, with a tonnage of 2,543 tons. At Nagara (pop. 10,000), in Banjermassin, are important factories of fire-arms and other weapons.

There has been constant war on the s. and e. coasts since 1859. In 1860, the direct government of Banjermassin was assumed by the resident; but the interior of the kingdom has always been disturbed, and especially in 1873, through the war with Atcheen (q. v.), inciting the Mohammedan population against the Dutch. In 1873 pop. of the s. and e. division, 869,763, of whom 403 were Europeans, and 2,643 Chinese.—See *Borneo's Westerafdeeling, Geographisch, Statisch, Historisch* (P. J. Veth, Amsterdam); the latest colonial reports by the Netherlands secretary of state for the colonies, etc.

PONTIFEX (of doubtful derivation) was the title borne by the members of one of the two great colleges among the ancient Romans, instituted for the purpose of preserving and cultivating religious knowledge; the other was the college of augurs. See **AUGURIES** and **AUSPICES**. It is customary to speak of the college of pontiffs as a "priesthood;" it was not, however, strictly speaking, such—that is to say, the members were not charged with the worship of any particular divinity, nor did they conduct sacrifices. Their duties embraced the regulation of all the religious rites and ceremonies (both public and private) of a state—e.g., how the gods should be worshiped, how burials should be conducted, how the souls of the dead (manes) should be appeased. To them was

intrusted the care of the calendar, the proclamation of festival days, etc. They also saw that every religious and every judicial act took place on the right day. "As they had thus," says Dr. Mommsen, "an especial supervision of all religious observances, it was to them in case of need (as on occasion of marriage, testament, or *arrogatio*) that the preliminary question was addressed, whether the matter proposed did not, in any respect, offend against divine law." In matters of religion they were the supreme authorities: from their decisions there was no appeal, and they themselves were responsible neither to the senate nor the people; further, they had power to inflict punishment on such priests as dared to disobey their injunctions, and deviate into schismatical courses. The words of Festus are, *Rerum quæ ad sacra et religiones pertinent, IUDICES ET IUDICES*. Their president was termed *pontifex maximus*.

The pontiffs, according to Roman tradition, were instituted by Numa—a mythical person, to whom the origin of nearly all the religious institutions of Rome is ascribed. But as they appear in all the Latin communities, they are regarded by Mommsen as a "thoroughly national Italian institution," and probably found a place in the earliest religious organization of the Latin race. Their number was originally four, or, including the *pontifex maximus*, five, all of whom were taken from the patricians. In 300 B.C., the Ogulnian law raised the number to nine, four of whom were to be plebeians. The first plebeian, however, who attained the dignity of *pontifex maximus* was Tib. Coruncanian, 254 B.C. Sulla, in 81 B.C., again increased the number to 15, and Julius Cæsar to 16. During the empire, the functions of *pontifex maximus* were generally discharged by the emperors themselves; and the name survived even the establishment of Christianity, occurring in inscriptions of Valentinian, Valens, and Gratianus; but at length the emperors dropped it, when it was picked up by the Christian bishops of Rome; and now this title, borrowed from a pagan cult, forms one of the sacred designations of his holiness the pope.

PONTIFICAL (Lat. *pontificale*, belonging to a pontiff or bishop), one of the service-books of the church of Rome, in which are contained the several services, whether in the administration of sacraments, or the performance of public worship, in which the bishop exclusively, or at least a priest delegated by the bishop, officiates. There were many such collections for the various national churches; but that which is now in universal use throughout the western church is the *Pontificale Romanum*, or Roman Pontifical, as published by authority of Clement VIII. in 1596, and repeatedly republished since that time. The Pontifical contains the services for ordinations, for religious professions and receptions of monks and nuns, consecrations, benedictions, etc., as well as of the solemn administration by a bishop of those sacraments which are ordinarily administered by priests. Besides the prayers to be recited, the Pontifical also lays down the ceremonial to be observed. The rules of this ceremonial are of two kinds—*perceptive*, the literal observance of which is obligatory; and *directive*, which admit of a certain interpretation.—Another of the service-books of bishops is called the "Ceremoniale;" but it is chiefly confined to a description of the peculiar ceremonial with which bishops are required to celebrate solemnly those offices, as of the mass, vespers, the funeral office, etc., which are common to them with priests. The most prized editions of both these service-books are those published by authority of the learned pope, Benedict XIV.

PONTIFICAL STATES. See PAPAL STATES, *ante*.

PONTIGNY, a village in France 13 m. n.e. of Auxerre; pop. 770; noted for its tile and brick, and for having an extensive ancient abbey, visited Sept. 3, 1874, by the English Roman Catholic bishop of Westminster at the head of 300 English pilgrims to visit the shrine of Edmund, patron saint of Westminster. The abbey was frequently the asylum of the bishops of Canterbury when at variance with English kings; Thomas à Becket found refuge there in 1164, since which time it has furnished asylum for a great number of royal heads.

PONTINE MARSHES (Lat. *Pomptinæ Paludes*), a low-lying district, forming the southern part of the Campagna di Roma, and extending in a south-easterly direction from Cisterna to the sea at Terracina. Its greatest length is about 30 m., and its breadth from 4 to 11 miles. It does not reach the sea-coast on the w., being separated from it by a broad sandy tract covered with forest; but even this barrier partakes to some extent of the character of the marshes themselves, being quite as flat, and largely intermixed with swamp and lagoon. The Pontine Marshes have undoubtedly been formed by the stagnation of the streams that take their rise in the Volscian hills, and by the accumulation of sand along the shore from Astura to the Circeian promontory, but this formation as undoubtedly belongs to pre-historic ages. There is no reason to believe that the Pontine marshes were, in ancient times, essentially different from what they are at present. Pliny, it is true, on the authority of a contemporary, Mucianus, states that at one period they had contained 24 or even 33 cities; but no confirmation of this statement is to be found in any earlier writer, and not a single name of these cities has been preserved. The first attempt to drain the Pontine marshes in ancient times was made in 160 B.C. by the consul, Cornelius Cethegus; but his efforts were only partially successful, for toward the close of the republic, the region had become as marshy as ever. Julius Cæsar, among his vast schemes for the improvement of the commonwealth, pro-

jected one for the drainage of this pestilential district, but his murder prevented its complete realization. Augustus also appears to have done something; but in the time of Juvenal, it was a mere haunt of robbers. Theodoric, the Goth, likewise tried to reclaim it; but the desolations of succeeding reigns soon reduced it to a hopeless condition, and it continued an uninhabitable region until the close of the middle ages. The first in modern times to resume the labors of the ancients was pope Boniface VIII., who drained the district about Sezzo and Sermonetta by means of a large canal. In 1417, Martin V. made another canal, called the *rio Martino*, which was dug to within a mile of the sea; but after his death the project was given up. Several additional efforts were subsequently made; but nothing was really accomplished till the time of pope Pius VI., who, in 1778, commenced to drain the marshes, and completed the drainage in 10 years. The reclamation of the land, however, has been found possible only in part. Though much is under cultivation and in pasturage, a great portion is hopelessly irreclaimable; and the whole region is so unhealthy, that, in the summer months, the inhabitants are obliged to remove to the neighboring mountains.—The famous Appian way (q.v.) went through the Pontine marshes; and after being unused for centuries, was re-opened by Pius VI.

PONTOISE, a small city in France; 20 m. n.w. from Paris, on the line of the Northern railway, at the confluence of the Oise and the Viosne; pop. 6,480. It has a considerable commerce in grain, and manufactures mill machinery, leather, and matches. It was a village antedating the Roman conquest, destroyed by the Normans in the 9th c., and down to 1753 had an eventful history.

PONTOON (through the French *ponton*, from the Latin *pons*, a bridge) the name given to buoyant vessels used in military operations for supporting a temporary bridge. Pontoon bridges have been constructed, with greater or less skill, from the earliest times. Darius passed the Hellespont and Danube by pontoon bridges, and the former was traversed by Xerxes's immense army on similar temporary bridges, very admirably formed. A pontoon train is a necessity for every army maneuvering in a country where there are rivers, and many campaigns have proved failures from the want of this cumbersome but indispensable apparatus. In most armies the pontoons are under the charge of the engineers; but in the Austrian army there is a distinct and highly-trained corps, called *pontonieren*. Marlborough used clumsy wooden pontoons. Napoleon and Wellington had them lighter of tin and copper. They were flat-bottomed, rectangular boats, open at the top. Anchored at stem and stern, beams were laid over from one to another, and transoms with planks crossing these beams completed the roadway of the bridge. These open pontoons were exposed to the disadvantage that they were very liable to be filled with water, and thus ceased to support the bridge. They were, moreover, very heavy, one pontoon, with appurtenances, constituting a wagon-load. As 36 were deemed necessary for the train, a pontoon equipment was a serious item in the *impedimenta* of an army. The open pontoons are now, however, obsolete, modern science having substituted closed cylindrical vessels of copper (or occasionally of India-rubber), which are far lighter, can in an emergency be rolled along, and can only be submerged if perforated. Against the last contingency, they are divided within into water-tight compartments, so that one perforation may not seriously detract from the total buoyancy of a pontoon. In the British service two pontoons are used: the larger, with hemispherical ends, being 22 ft. 3 in. in length, and 2 ft. 8 in. in diameter; the smaller, cigar-shaped, with conical ends, 15 ft. in length, 1 ft. 8 in. in diameter. Two of the largest used to form a raft weigh 8 cwt. 7 lbs.; the superstructure, 18½ cwt. At 24 ft. apart from center to center, this raft will carry infantry four deep, marching at ease; cavalry, two deep, and light field-guns; at 16 ft. interval, heavy guns. A raft of three pontoons, at close distances, will support siege-ordnance. The pontoons can be used in very wide rivers as rafts, in their proper sense, or they can be connected, when the width permits, to form a bridge. In the latter case each is towed into line, anchored above as it drops to its place, and a second time when its exact spot is reached. It is computed that each pontoon requires 1½ minutes to take its position, and that when the pontoons are placed, the roadway can be laid, if properly arranged previously, in 1½ minutes for each interval between two pontoons. A river of 600 ft. may thus be bridged in less than 1½ hours. The process of throwing a bridge over in face of an enemy is fraught with the utmost danger to the engineers employed. Pontoon bridges have to be passed with great care, and every measure should be adopted, as breaking step, etc., which can reduce the peculiarly dangerous vibration.

PONTOPPIDAN, ERK, 1698–1764; b. Aarhus; studied theology at the university of Copenhagen, giving also special attention to geography and history. After graduation he became traveling tutor to several young noblemen; was made a chaplain to the king 1735; professor of theology at Copenhagen 1738; and bishop of Bergen, Norway, 1747. Among his numerous writings were *A History of the Geography, Natural History, and Antiquities of Denmark*; a similar history of Norway, which has been translated into English; and *Annals of the Danish Church*.

PONTOTOC, a co. in n. Mississippi, watered by the Tallahatchee and Loosacoona rivers; about 450 sq.m.; pop. '80, 13,858—4,250 colored. The surface is rolling and

heavily wooded. The soil is fertile. The principal productions are corn, cotton, and live stock. Co. seat, Pontotoc.

PONTREM'OLI, a t. in the province of Massa-Carrara, Italy; on the s. slope of the Apennines; 23 m. n.w. of Carrara, near the junction of the Verde with the Magra river; pop. about 12,500. It is divided into an old and new town; the former was strongly fortified and guarded by a castle on a neighboring hill. There is a cathedral in the modern part of the city. The citizens are mostly engaged in manufacturing silk, linen, and woolen cloth. In 1834 the inhabitants were driven from the town by a severe earthquake.

PONTUS, the name given by the ancient Greeks to a country in the n.e. of Asia Minor, bordering on the Pontus Euxinus (whence its name), and extending from the river Halys in the west to the frontiers of Colchis and Armenia in the east. Its southern limits were the ranges of Anti-Taurus and Paryadres, so that it corresponded pretty nearly to the modern pashaliks of Trebizond and Siwas. On the e. and s. Pontus is mountainous, but along the coast there are large and fertile plains, which in ancient times produced, and indeed still produce, abundance of grain, fruits, and timber. Game, according to Strabo, was also plentiful. The rearing of bees was carefully attended to, and honey and wax were among the chief articles of commerce. Iron was the principal mineral.

Regarding the ancient inhabitants of Pontus nothing is known ethnologically. Greek colonies, indeed, flourished on the coast from the 7th c. B.C., and doubtless spread some knowledge of civilization among the inland barbarians; but how far the latter were influenced thereby we cannot tell. They first appear as divided into numerous tribes, virtually independent, but owning a nominal allegiance to the Persian kings, whose authority was represented by a hereditary satrap belonging to the royal family of Persia. It was one of these satraps, Ariobarzanes, who, by subjugating some of the Pontian tribes, in the year 363 B.C., during the reign of Artaxerxes II., laid the foundations of an independent sovereignty. Ariobarzanes was succeeded in 337 B.C. by Mithridates II., who took advantage of the civil confusions that followed the death of Alexander the great to enlarge his dominions; but the greatest of these Pontine sultans, and one of the most formidable enemies that Rome ever encountered in the east, was Mithridates VI. (q.v.). On the overthrow of this potentate by Pompey (65 B.C.) the western part of Pontus was annexed to Bithynia, and the rest parceled out among the neighboring princes. Subsequently a grandson of Mithridates, Polemon, was installed monarch of the central part of Pontus; but in the reign of Nero it was voluntarily ceded to the Roman emperor, became a Roman province, and was called *Pontus Polemoniacus*. In the reign of Constantine it underwent a new division. The principal towns of ancient Pontus were Amisus, Polemonium, Pharnacia, Cerasus, Trapezus, Apsarus, Cabira, and Neocæsarea.

PONTUS EUXINUS. See BLACK SEA, *ante*.

PONTYPOOL, a small market t. of Monmouthshire, 20 m. w.s.w. of Monmouth, and 10 m. n. of Newport, with both of which it is connected by railway. Japan wares were long made here, but this branch of manufacture has declined. Articles in polished iron are made, and the iron forges and coal and iron mines which surround the town employ many of the inhabitants. Pop. '71, 4,834.

PONY, the common name of many small active breeds of horse (q.v.), belonging to different countries, from India and Africa to Iceland; but in the warmer parts of the world chiefly found in mountainous or sterile regions. They are in general the property of man, and not truly wild, although, in very many cases, they live almost in a wild state, and receive no care or attention except when they are wanted for use. They are in general very hardy, and their strength is great in proportion to their size. They are often vicious, or at least playfully tricky to a much greater degree than is usual with large horses. Ponies are very often covered with rough hair, and have large shaggy manes and forelocks. The *Shetland pony* is a very good example of these small races of horse. The *Iceland pony* is scarcely different from it, and is hardly enough to endure the winter of Iceland without shelter. The *Galloway, Welsh, Dartmoor, Exmoor*, and *New Forest* breeds are British races of pony larger than the Shetland. The progress of inclosure and cultivation in their native regions has so changed the circumstances in which they long subsisted, and in which, perhaps, they originated, that scarcely any of them is now to be seen of pure and unmixed race. Sardinia and Corsica have small races of pony which have subsisted unchanged from ancient times. In the Morea there is a race of ponies, driven in herds to Attica for sale, exceedingly wild and vicious, but capable of being rendered very serviceable. But it is unnecessary to mention the many races both of Europe and Asia. They differ considerably in size, some, like the Shetland pony, suggesting a comparison with a large dog, some much larger. They also differ much in color; a dun or tan color, with a black stripe along the back, is prevalent in many of them. Ponies are seldom employed in agricultural labors; but they are of inestimable value in many wild and mountainous regions, from their hardiness and surefootedness; and are often used as saddle-horses, the largest kinds being even employed as horses for light-cavalry.

POODLE (*Germ. Pudel*), a kind of dog, originally German, but extensively diffused throughout Europe during the wars of the French revolution, and abundantly introduced into Britain by the soldiers who served in Spain and the Netherlands. It is very closely allied, however, to the coarser crisp-haired *water-dog*, long well known in England, and particularly to water-fowl shooters, and the fishermen of the north-eastern coasts. The *barbet* of the French is a diminutive variety, much in request as a lady's pet. The poodle is of a stout form, and has a short muzzle standing out abruptly from the face; the ears are of moderate length, and pendent; the tail rather short; it is everywhere covered with long curled hair, which in many of the little barbets hangs to the very ground. No kind of dog exhibits greater intelligence or greater affection; and as to both, many interesting stories are on record.

POOLE (so called from the inlet or *pool* on which it stands) is the chief sea-port of Dorsetshire, and is situated on a wide but shallow inlet in the e. coast of the county. It is built of red brick, is intricate and confused in plan, but is pierced by the High street, a m. in length. Along the shore are capacious quays, well lined with shipping. The town is more noted for its trade than for its architecture. Sail-cloth and cordage are manufactured, and together with potters' and pipe clay, provisions, and articles of clothing, form the principal articles of export. Ship and especially yacht building is carried on. The harbor, into which fall the rivers Trent and Frome, is a beautiful estuary, and is a fine feature in the charming scenery of the vicinity. Its depth of water is 13 to 14 ft., and its navigable channels, being unobstructed by rocks or sands, are perfectly safe at all times. Brownsea island, in the middle of the pool, is 6 m. in circumference. On its extreme point stands the castle of the same name. In '75, 657 vessels, of 58,055 tons, entered, and 814, of 61,586 tons cleared the port. Pop. '71, 10,079, who return one member to parliament.

POOLE, JOHN, 1786-1872; b. England; author of many dramatic pieces, novels, essays, and character sketches, some of which were republished in the United States. His farces were acted in the London theaters by Mundon, Liston, Keeley, Cooper, and other distinguished comedians; and many of them are still popular. In his old age he received, chiefly through the influence of Charles Dickens, a small pension from the civil list; but having outlived all his contemporaries, he died neglected and almost forgotten.

POOLE, MATTHEW, a learned English divine of the Puritan age, was born at York about the year 1624, and educated at Emmanuel college, Cambridge. Very little is known regarding his life. In 1662 he figures as preacher in the church of St. Michael le Querne, in London; but was one of the 2,000 ministers whom the act of uniformity compelled to leave the church of England. Subsequently he retired to Holland, and died at Amsterdam in 1679. His principal work, *Synopsis Criticorum Bibliorum* (5 vols. fol. 1669-76, is an attempt to bring together in a condensed form the opinion of 150 biblical critics of all times and countries previous to his own. It is a work showing great (professional) learning, and very respectable talent; but later criticism and research have done much to render it obsolete. Other productions of Poole's are *Annotations on Scripture*, and *The Nullity of the Roman Faith*.

POOLE, WILLIAM FREDERICK, b. Mass., 1821; graduated at Yale college in 1849. He was librarian of the Boston mercantile library 1852-56, then became librarian of the Athenæum library, in the same city. Here he remained thirteen years, becoming well known as one of the leading librarians of the country—a class then including Cogswell, Jewett, Spofford, and Moore. He was for a time in charge of the Cincinnati mercantile library, but left it to accept the librarianship of the Chicago public library, where he now is. In 1848 he published his *Index to Subjects in Reviews and Periodicals*; afterward enlarged to the *Index to Periodical Literature*, 1853; and now announced for republication, extended to date. He also wrote *The Battle of the Dictionaries*, 1856; *Websterian Orthography*, 1857; *The Orthographical Hobgoblin*, 1859; *The Mather Papers*, 1868; and *Cotton Mather and Salem Witchcraft*, 1869.

POONA, or **PUNA**, the capital of a district of British India, of the same name, in the presidency of Bombay, is situated on the small river Moota, near its confluence with the Moola, in a treeless plain about 74 m. s.e. of Bombay. Its present pop. is estimated (1872) at 90,436; but in its palmy days, when it was the capital of the Mahratta power, it contained more than twice that number. A large proportion of the population consists of Brahmans. The city is divided into seven quarters, named after the days of the week, and the principal building is a palatial structure, formerly the residence of the peishwah. Its climate is salubrious and pleasant, and it is the headquarters of the Bombay army. The cantonment for the infantry and horse-artillery is from one to two m. w. of the city. The cantonment for the cavalry is at the village of Kirkee, about two m. to the north-east of the city. In 1821, soon after Poona came into the possession of the British, a college was established for the study of Sanskrit literature, in the hope that the disaffected Brahmans (who had been all-powerful under the peishwah) might be thus conciliated. As the modes of instruction originally adopted were entirely native, and far from efficient, the college has gradually been transformed. At present it possesses a staff of European professors with native assistants, and is a highly

respectable seminary for the study of English, Marathi, and Sanskrit. Only Brahmans were admissible into the college as first established; now it is open to the public generally. Poona is very much resorted to, particularly in the rainy season (from June till October), on account of its pleasant and salubrious climate. The fall of rain averages from 22 to 25 inches annually; whereas at Bombay it is about four times as great. The range of the Ghauts (properly called the Sahyadree range) which rises up as a precipitous barrier 2,000 ft. high, with peaks considerably higher, receives the full burst of the monsoon; so that Khandalla on the top of the Ghauts is drenched with almost perpetual rain for four months. Then the clouds pass on, relieved of their watery burden, and the rainfall eastward of the Ghauts is much less. From the Ghauts, the whole country gradually slopes toward the bay of Bengal. Poona is about 1800 ft. above the sea level. One of the most interesting objects in the neighborhood of Poona is a large *bund*, or embankment, solidly built of hewn stone over the Mootamoola river for the purpose of providing a supply of water for the cantonment, and especially the bazaar or native town connected with it. It was built by the late sir Jamsetjee Jeejeebhoy, whose charities were very great. Two forts celebrated in Maratha history are close to Poona—Singhur, about 12 m. to the south-east, and Poorundur, about 18 m. to the south. These are favorite sanatoria during the hot season (from the end of February to June). At Poorundur there is a sanatorium of considerable size for sick soldiers. Poona was formerly a great mart for jewelry and precious stones, but the trade in these things has quite ceased. The native manufactures have also been supplanted by the introduction of European piece-goods, and the only business that prospers is that of dealers in grain and other agricultural produce. The railway has rendered Poona almost a suburb of Bombay. The works by which the railway climbs up the great mountain-barrier of the Ghauts from the lowlands of the Konkan to the high table-land of the Deccan are among the boldest that have as yet been undertaken. The line up the Ghauts was opened in April, 1863.

Of late years great alterations have taken place around Poona. The native city has not greatly altered, except that the streets have been widened and cleaned; but the cantonment has changed rapidly. The great fire of 1879 has left its mark on Poona. Among the most striking of the many new buildings recently reared is the government college—a Gothic building, recently finished, which was erected mainly at the expense of sir Jamsetjee Jeejeebhoy. While speaking of education in Poona, it is but fair to the Scottish mission to say that it commenced English education in Poona soon after the mission was established (in 1831), and has all along carried it on. The schools of the mission, both male and female, both for English and the vernacular (Marathi), are largely attended, even by the highest castes. The female pupils are upward of 300 in number; and one school consists of Mussulman girls. The Mussulmans in India generally are far behind both Hindus and Parsees in their desire to educate the females; in fact, a Mussulman female school is as yet exceedingly rare.

POONA-WOOD is the timber of the poon trees of India (*calophyllum inophyllum* and *C. augustifolium*). It is very commonly used in the East Indies, particularly in ship-building, for planks and spars; these latter are usually called *poon*, and are in general use for masts in that country. The trees are natives of Penang, and of the countries eastward of the bay of Bengal.

POOP, in large vessels, is a sort of supplemental deck raised over the after part of the upper deck. The best cabins are situated beneath it. In old ships a second and even a third poop were raised above the hinder part of the poop proper, giving the vessels that immense height at the stern which is shown in old drawings. The poop is gradually disappearing from ships built either for speed or war, as offering undue resistance to the wind in one case, and an undesirable mark to an enemy in the other.

POOR, DANIEL, D.D., 1789-1850; b. Mass.; graduated at Dartmouth college, 1811; Andover theological seminary, 1814. With the rev. Messrs. Richards, Meigs, and Warren, and their wives, he embarked at Newburyport, Oct. 23, 1815, with the purpose of establishing a Christian mission in Ceylon. They reached Colombo, March 23, 1816, and proceeded thence to the cluster of islands lying off the northern extremity of the main island, where they began their work. Dr. Poor had great earnestness, and had the mental quickness and keenness needed in discussing religious truth with the natives. For several years he had charge of the mission seminary for native young men at Batticootta. In the course of his instructions in the school he demonstrated so clearly the superiority of our astronomical calculations over those of the Hindu astronomers, especially in the accuracy with which we predict eclipses, as to make a great impression on the minds of the heathen, who had thought themselves well advanced in the science. In March, 1836, committing the seminary to other hands, he passed to the continent, and established himself in Madura, a stronghold of heathenism, which has since become a center of mission work and of Christian institutions in southern India. In 1848 he visited his native land, and in many places presented the claims of the heathen with fervor. He returned in 1850 to Jaffna, where he died of cholera.

POOR, ENOCH, 1736-80; b. Mass.; a merchant in Exeter, N. H.; brig.gen. in the continental army in 1777; distinguished in the battles against Burgoyne, and at Mon-

mouth, and in 1780 commanded one of Lafayette's light-infantry brigades. He was killed in a duel with a French officer.

POOR, JOHN ALFRED, 1808-71; b. Maine; practiced law in Portland and Bangor, but afterward devoted himself to the developing of railroad interests in that state. He originated the European and North American railroad, and was president of the proposed Portland, Rutland, and Oswego railroad, which was designed, by consolidating numerous existing New England roads and building where necessary, to establish a through line to Chicago, 1000 m. in length. This design was never carried out, the existing Portland and Ogdensburg being the nearest approach to that result. Mr. Poor was a member of the legislature of Maine, and for some years editor of a newspaper, *The State of Maine*. He was an industrious investigator into local history; delivered the address at the Popham celebration in 1868; and wrote, in 1862, *A Vindication of the Claims of Sir P. Gorges*, etc.

POOR, THE. Charity, like Christianity, had its origin, or earliest development, in the east. Among the primitive nations of the world alms-giving was inculcated as a religious observance, and is prescribed as such in their sacred records. Among the European nations of antiquity, we find a provision for the poor adopted as a matter of state policy. In early times Athens could boast of having no citizen in want, "nor did any disgrace the nation by begging." But war, at length, brought poverty in its train, and the Athenian people decreed the maintenance of those who were mutilated in battle; and, at a later period, of the children of those who fell. Plutarch mentions Peisistratus as the originator of the first decree, though others derive it from Solon. By the latter decree the state provided for the orphans of its soldiers up to their eighteenth year, and then sent them into the world with a new suit of armor. The bounty given to the disabled is mentioned by Lysias, Harpocratian, Aristotle, Isocrates, and others; and is variously stated at one, two, and three oboli a day, and it seems to have been increased with the increased cost of subsistence. There were also societies for the relief of distress among the democratic states of Greece, called *eranos*—a sort of friendly society, in which the members relieved were expected to pay back the money advanced to them when they had raised themselves to better circumstances. But it must be remembered that these so-called democratic states were in reality slave-holding aristocracies.

Among the Romans, the Agrarian and Licinian laws (years of Rome 268 and 338) were framed in order to prevent the extremes of riches and poverty in the state. They limited the extent of property in public land to be held by each citizen, and the latter directed that all such land, above the allotted portion, should be taken away from the holders and given to those who had none. The distribution of grain at reduced prices, which at length became gratuitous, was introduced by Caius Gracchus, and lasted till the fall of the Roman empire. Augustus in vain tried to suppress it. In his time 200,000 citizens were thus fed. Cicero makes mention of this provision as in great favor with the Roman people, because it furnished them with an abundant subsistence without labor; other Roman writers describe its results as disastrous both to agriculture and manners, creating a nation of mendicants, and causing the land to fall out of cultivation.

In the middle ages, the great body of the laboring classes were in a state of bondage, and looked to their feudal lords for maintenance. The obligation to provide for their slaves, or serfs, seems to have been fully recognized, so that many encountering, in a state of freedom, the miseries of want, went back to bondage as a refuge from destitution. The villeins in Saxon England were attached to the soil, and received from their lord a portion of land for the support of themselves and their families. But the church of Rome constituted herself the great receiver and dispenser of alms. The rich monasteries and abbeys distributed doles to the poor.

In most states of continental Europe, the church remains to a larger or smaller extent the public almoner, the state only stepping in to supplement the offerings of the church and voluntary charity when they become deficient. The disservice from the church is hardly anywhere so complete as in England. The laws of different countries vary as to the degree of want entitling a pauper to relief, the extent to which the right to relief is matter of positive right, the conditions which give rise to a claim of relief, and the incidence of taxation. In the Netherlands, a title to relief is acquired by birth, or by having inhabited the same place uninterruptedly for six years. In Sweden, such title as the law allows is conferred by inhabitaney in the parish or town, if the applicant, being above 45 years of age, has been entered on the list of tax-payers. In Nerway, the right is acquired by a residence of two years; in Denmark, of five years. By the Prussian poor-law of 1842, the duty of relief falls on the commune of which the person applying was expressly admitted a member, in which he has acquired a regular abode, which he has occupied for a year, or in which he has been living for three years after attaining full age. In Sleswick-Holstein, the right to relief in a commune is acquired by birth; also by 15 years' residence after the age of 18, the latter mode of acquiring it being competent to foreigners. In Saxony a settlement is acquired by birth, express gift, or purchase of a house and 5 years' residence.

In Spain the state supports several asylums for lunatics, the blind, and deaf and dumb. It also distributes a large sum annually among the provinces for the relief of the

poor—each province being bound to raise double the amount received from the state. The state also steps in for the relief of great calamities, and devotes a certain sum annually for the assistance of unfortunate Spaniards abroad. A general directory of the charitable and sanitary services superintends the parochial bodies charged with the distribution of assistance to the poor.

In Austria each commune is charged with the relief of the poor. All who have legal domicile, or, being unable to prove their domicile, are resident in the commune, are entitled to relief out of the general assessment. There is no special rate, and the administration is strictly municipal. In many provinces private charity is associated with public assistance, administered by the curé, a few chosen inhabitants, who are called "fathers of the poor," and an officer accountable to the commune. This system is called the "poor's institutes;" and their funds are principally derived from private sources; but they receive a third part of the property of ecclesiastics who die intestate, and certain fines, etc. Applicants are subjected to minute inquiry as to the cause of poverty, and a weekly allowance is made on a scale according to age and necessity. The infirm poor, who have no relatives to reside with, are taken into hospitals established in almost every commune, where they receive, besides lodging, fire, and light, clothing, medical care, and a small allowance in money to provide for their food and other wants. Children are either provided for in the homes of their parents, put into asylums, or boarded with people of probity, who receive a monthly payment, as in Scotland. The welfare of these children is superintended by the curés, the maires, and the sanitary officers of the commune. Foundlings, lunatics, the blind, deaf, and dumb, are provided for by the state. Vagrancy is punished, and parents permitting children under 14 to beg are liable to three months' imprisonment. Able-bodied vagrants are sent to houses of correction, and kept to work. Pawnbroking is a charitable institution in Austria, under government control, and many pawnbroking establishments rest on endowments, and lend without interest. The trade is forbidden to private persons.

In France the relief of the poor is not compulsory, in as far as its distributors may, after making inquiry, refuse relief, except in the case of foundlings and lunatics. The minister of the interior has a general superintendence of the machinery of relief, as well as the immediate administration of many large hospitals and refuges. He also assists a great number of private charities. The other ministers of state give assistance on the occurrence of great calamities. The departmental funds are called upon for the compulsory relief, but the commune is the main source of public assistance. Its duty is to see that no real suffering remains unrelieved, and that the nature of the relief is such as can most easily be discontinued when the necessity ceases. The commune encourages and stimulates voluntary charities, and receives gifts for the benefit of the poor's fund. Except in Paris, the administration of the hospitals, and of the relief given at the homes of the poor, are under different management, the communes only interfering to supplement the funds of the hospitals, when these are insufficient. The maire is president both of the administration of the hospitals and of the body for giving out-door relief (the *bureau de bienfaisance*). During industrial calamities, the poor are sometimes employed in work-shops supported by the public, and in public works. In Paris, since 1849, there has been a responsible director set over all the charities of the city. He manages the out-door relief through the medium of the committees of assistance, formerly called *bureaux de bienfaisance*, in each arrondissement. He is under the inspection of a council, composed as follows: The prefect of the Seine (president), the prefect of police, two members of the municipal council, two maires or deputy-maires, two members of the committee of assistance, one councilor of state or a master of requests, one physician and one surgeon practicing at the hospitals, one professor of medicine, one member of the chamber of commerce, one member of the council of prud'hommes, and five members taken from other classes than those above mentioned. Begging is forbidden, and punished, wherever there are establishments for the relief of the poor.

In the Hanse towns, there were introduced, in 1788, a system of voluntary contributions aided by fixed subsidies from the government. This at length resulted in government supplying all deficiencies, which in the last few years have been 80 per cent of the cost of the general poor relief. In Holland pauper colonies have been supported by government for the last 40 years. Vagrants, after a short imprisonment, are sent to one of these, under a system of discipline quite as rigorous as an Irish intermediate prison. Paupers of good character are sent to maintain themselves and their families, by agricultural labor, in free colonies. The working of the system is pronounced costly and unsatisfactory.

In America, the system is very similar to our own. Every man is entitled by law to relief from the town of his settlement, the rate being assessed on whole towns, and not on parishes. The states have their own poor-laws, but paupers are removable from one state to another. Any American becoming a pauper loses his state rights. The acts concerning work-houses and paupers in the revised code of Massachusetts may be taken to represent generally the state of the law throughout the Union. The former provides "that any town may erect or provide a work-house for the employment and support of all poor and indigent persons that are maintained by, or receive alms from the town; all persons who, being able to work, and not having means to maintain themselves, refuse or neglect to work; all persons who live a dissolute, vagrant life, and exercise no ordi-

nary calling or lawful business, and all such persons as spend their time and property in public-houses, to the neglect of their proper business, or by otherwise mis-spending what they earn, to the impoverishment of themselves and their families, *are likely to become chargeable to the town or the commonwealth.*" The idle and the vagrant may be committed to the work-house, and kept to labor, as in a house of correction. There are provisions for enforcing the claims of kindred, and for the immediate relief of strangers. The administration is in the hands of overseers, who have discretion as to the mode of relief.

The annals of the poor in England are neither short nor simple. Severe enactments for the repression of vagabondage and mendicity date from a very early period. In ancient Saxon times, the householder was bound to provide for the laborer, and men who had no master were, by the Folkmote, assigned to some householder; but when freedom began to prevail, this state of things naturally came to an end. No master was bound to provide for the freeman, and when he failed to provide for himself, by honest labor, he generally took to vagrant begging, often to violence. The statute of Winchester (13th Ed. I., 1285) shows the poor utterly uncared for, and the roads infested by vagrant robbers. Up to the reign of Richard II., the sole idea of English rulers was to treat pauperism as a crime, and repress it by punishment, and by the most unjust and absurd restrictions on the freedom of labor. The 23d Ed. III. forbids giving alms to vagrants, on pain of imprisonment; then also the laws of settlement had their origin in the attempt to chain the free laborer to the land. See SETTLEMENT. The 12th Richard II. (1388), c. 7, is the first statute that makes provision for the impotent poor. The statutes of Henry VII. endeavor to carry out, by the severest measures, the system of repression. The 27th Henry VIII. c. 25 (1535), introduced the principle of compulsory assistance, though it was by way of voluntary alms. Each parish was ordered to receive and provide for the impotent, and set the able-bodied to work. Alms were to be collected into a general fund, and indiscriminate almsgiving was forbidden, on pain of forfeiture of ten times the value given. The sturdy beggar was treated without mercy, was to be whipped when first caught, next to have his ear cropped, and for a third offense, to suffer death, as a felon and enemy to the commonwealth. This is repealed by 1st Ed. VI. c. 3 (1547), because "through foolish pity, it is rendered of non-effect." Not much milder, to modern ideas, seem the substituted penalties—viz., branding, on first conviction, with a V on the shoulder, and being adjudged a slave for two years, to be claimed by any one, fed on bread and water, and caused to work by beating, etc. Running away from this tender treatment was punishable with S branded on the face, and slavery for life to the town or parish, on the roads of which the incorrigible vagrant was to work in chains, at the penalty of the town or parish. Other two acts of Edward's reign return to earlier and considerably milder measures of restraint. A little urging was now found necessary to obtain funds for the maintenance of the poor. The collectors were gently to ask every man and woman at church what they would give; but if one could not be persuaded, the bishop was to send for the recusant, and use "charitable ways and means." At length, the 5th Elizabeth, c. 3 (1563), provided that he who obstinately refused to give should be handed over to the more persuasive arguments of the justices, who were empowered to tax him at their discretion, and send him to jail for default. Ten years later, the power of compulsory assessment is given to the justices, and abiding-places are ordered to be provided for the aged and infirm. These statutes culminated in the 43d Elizabeth, c. 2 (1601), which has formed the basis of the poor-law system of England up to the present time. It taxed every inhabitant of every parish for the relief of the poor. It directed the justices in every county to appoint three or four substantial householders in each parish to be overseers of the poor, along with the churchwardens. It ordered the relief of the impotent, and the apprenticing of children, and the providing of work for the able, by means of "a convenient stock of flax, hemp, wool, thread, iron, and other necessary ware and stuff." The great act of Elizabeth came but slowly into operation. Up to the reign of Charles I. there were many parishes in which no rate was assessed, and which turned away their poor; but the great evils had been remedied, and there is little legislation on the subject for the next hundred years. The 3d William and Mary, c. 2 (1691), an act relating chiefly to settlement, provides that the persons to be relieved be registered and examined by the vestry, because evils had arisen out of the unlimited power of the churchwardens and overseers giving relief "for their own private ends," by which the charge on the parish was greatly increased, contrary to the true intent of the statute of Elizabeth. This act also gave power to the justices to order relief in cases of emergency, a provision which afterward became a fruitful source of difficulty. The evils henceforth complained of were, that many had thrown themselves on the rates who ought to have been supporting themselves independently of such aid; that pauper labor was found interfering with and displacing industrial labor; that the overseers were acting with unchecked dishonesty; and justices, with unrestrained liberality, ordering the money of the industrious and prudent to be spent upon the idle and improvident. Efforts were made to remedy these abuses throughout the reigns of the first three Georges, by making the justices act with the overseers, by rendering the overseers accountable to the parishioners by means of returns, and the power of inspection, and by the offer of the work-house to all applicants for relief. This last provision, made in the reign of George I. (9th Geo. I. c. 7, 1723), sub-

stituted what is called in-door relief, for the allowance made to the poor at their own homes, and introduced the work-house system. All who refused to be lodged in the house were to be struck off the poor's-roll, and refused relief. A great increase in the number of work-houses took place; guardians were appointed to guard the pauper children from neglect and improper conduct, and other attempts to improve their administration made; work-house unions were also introduced by an act called Gilbert's act (1782), and a succession of acts passed for the protection of parish apprentices. Toward the close of the 18th c. a great relaxation took place in the treatment of the poor. The 36th Geo. III. c. 10 and 23 (1796), increased the amount, and extended the application of relief. It repealed the act forbidding relief to those who refused the work-house, and allowed relief to be given in aid of wages. Henceforth, out-door relief became the rule under a variety of systems, of which the complaint was justly made, that they turned the poor-laws into a mode of paying wages. In 1801 the amount of the rates was reckoned at £4,000,000. In 1820 it had risen to £7,330,254. In 1817 a commission of the house of commons stated their opinion, that, unless checked, the assessment would swallow up the profits of the land. Though the two vestry acts, which resulted from the commission appointed in 1817, seem to have done something to remedy the evils complained of, a new commission to inquire into the operation of the poor-laws was found necessary, and appointed in February, 1832. The evidence brought before this commission revealed a disastrous state of things. The independence, integrity, industry, and domestic virtue of the lower classes were in some places nearly extinct. The great source of the evil was shown to be the relief afforded to the able-bodied on their own account, and that of their families, in aid of wages. This aid at first reduced the expenditure in wages, and found favor with farmers and magistrates, who framed scales of relief in accordance with the wants of the people, so that they began to be paid for their necessities, and not for their industry, and fell into the temptation of increasing the former, and neglecting the latter. Five modes of out-door relief were found in operation: 1. Relief without labor; 2. Allowance given, in aid of wages, according to the number of the laborer's family; 3. The roundsmen system, the laborers being let out, by the parish, among the employers round; 4. Parish work, generally on the roads; 5. The labor-rate, the rate-payers preferring to divide among them the pauper labor, and to pay for it, however valueless, instead of raising a rate. Diminished industry ate away the very root of capital. Farmers turned off their men, or refused to employ them at fair wages, thereby causing a surplus of unemployed labor fraudulently; they then took them back from the parish at reduced wages, paid out of the rates. Under the system of allowance, there were parishes in which every laborer was a pauper, paid more for idleness than he could get for labor, paid more if he took a pauper wife, and still more for every pauper child. Paupers married at 17 and 18 years of age, and claimed the allowance the day after their marriage; and from parish after parish came the reply to the queries of the commissioners, "All our able-bodied laborers receive allowance." No poor man in such parishes could save; if industrious and thrifty, and it was known that he had a fund of savings, "he would be refused work till the savings were gone," and he had come down to the pauper level. This had gone on, till in many places pauperism swallowed up three-fourths of the rent. Nor was the mal-administration confined to the rural districts; the evidence showed that it extended all over the country, and into the manufacturing towns, where the out-door relief was a source of constant imposture. The administration of in-door relief was also full of abuses, from want of classification, discipline, and employment. Better food and lodging was provided for idle paupers than working-people could procure—better, even, than could be afforded by many of the rate-payers. In 1834 the commissioners reported that they found the administration "opposed to the letter and spirit of the law, and destructive of the welfare of the community." The commissioners strongly laid down the principle, that the condition of the pauper ought to be below the lowest condition of the independent laborer, because every penny bestowed in rendering the condition of the former more eligible than that of the latter, is a bounty on indolence and vice, and recommended: 1. The cessation of out-door relief; 2. A central authority to control the administration; 3. Unions for the better management of work-houses, and the classification of their inmates; and 4. A complete and clear system of accounts. The bill embodying these recommendations was brought in, March 17, 1834, passed its second reading in the house of commons with only twenty dissenting votes, and became law on the 14th August as the 4th and 5th Will. IV. c. 76. This act was not a change of law, but of administration. The orders of the new board restricted overseers, on the formation of a union, to the collection of rates; appointed paid relieving-officers to dispense relief under the directions of the unpaid boards of guardians; required the gradual withdrawal of out-door relief; and enforced classification and discipline in the work-houses. A rapid formation of unions took place under the new board. In the first eight months 112 were formed out of 2,066 parishes. The pauperized districts experienced a great and immediate relief, numbers of paupers going off when they found that relief involved adequate work, or the strictly-disciplined work-house; wages rose, and the expenditure was reduced on an average 20 per cent. At the accession of George I. in 1714, the poor-rates amounted, as nearly as can be estimated, to £950,000, equal to 3s. 6½d. per head on the population of 5,750,000. At the accession of George III. in

Poor.

1760, the population had increased to 7,000,000, the poor-rates to £1,250,000—an average of 3s. 3¼d.; while in 1834, the population, estimated from the last census, was 14,372,000, and the money expended in relief, £6,317,255—equal to 8s. 9½d. per head. In three years, the operation of the amendment act had reduced the expenditure one-third, viz., to £4,044,741. In 1848 the commissioners were exchanged for a public board, which is one of the government departments, with a president, in whom has been vested the power of the commissioners, and who holds office as one of the ministers of the crown. There are 631 unions. In 1860–61 the number of poor receiving relief in England was about 850,000, about 4½ per cent on the population: of these, about 140,000 were relieved in work-houses. The commissioners were unable to withdraw out-door relief, which continues to be in England the most important item. With the aged, the sick, and orphans, the guardians deal at their discretion; but stringent rules for the relief of the able-bodied are in operation under the board, whose orders have the force of laws. In the rural districts, guardians are prohibited from giving relief to the able-bodied out of the house, unless under a supplemental order, in emergency. For other places, the general rule forbids relief to be given in aid of wages, and requires work to be supplied. Exceptions are made by the board on the application of the unions when necessity arises, as in the recent case of the cotton districts. The expenditure is strictly guarded and examined by public auditors, of whom there are fifty-four for England. A district medical officer, of whom one or more are appointed for each union, attends to all cases of sickness among the poor.

Scotland and Ireland have been legislated for separately. Their poor laws are similar to the English in principle and practice; both are administered by a central board, which supervises the local bodies charged with relief, and in both the rate is levied on the annual value of real property. The present system in Scotland was instituted by the 8th and 9th Vict. c. 83 (1845). Scotland is divided into 883 parishes, some of them combined for poor-house accommodation. The relief is administered by a parochial board, appointed by the rate-payers, the burgh magistrates, and the kirk-session. They appoint inspectors of the poor, who act as relieving officers. The Scotch law differs from the English and Irish in allowing no relief to able-bodied adults. Claimants must be aged, infirm, or disabled. Out-door relief is the rule. As regards the working of the Scottish poor-law, its great and acknowledged defect is the constant and costly contest respecting settlements, or right to fix claims on particular parishes. Scotland had, in 1874, 64 poor-houses for 406 parishes, having a population of 2,407,441. Ireland had no poor-laws until the year 1838, when they were introduced by the 1st and 2d Vict. c. 56. For the purpose of relief, Ireland is divided into 163 unions of townlands or parishes. Each union has a work-house managed by a board of guardians, elected by the rate-payers. Every destitute person has an absolute right to relief, which is administered almost entirely in the work-house. The average yearly population of the United Kingdom during the 10 years ending 1870 was 29,694,138; average paupers in each year, 1,140,185, or 3.9 per cent. They were apportioned as follows:

	Population.	Paupers.	Percentage.
England.....	20,998,332	973,860	4.6
Scotland.....	3,044,919	100,927	3.3
Ireland.....	5,650,897	65,398	1.2

The total expenditure in the United Kingdom during the 10 years was £80,901,456, or an annual charge of 5s. 5½d. per head on the average population of the period, apportioned as under:

	Amount of Assessment.	Per head per annum.	
	£	s.	d.
England and Wales.....	67,286,674	6	4½
Scotland.....	6,191,066	4	0½
Ireland.....	7,423,716	2	7½

To look back 10 years, the rate which, at the end of the financial year 1861, was 5s. 9d. a head on the population, was 6s. 4½d. two years after—a fact due to the cotton famine. Applying similar calculations to the 5 years 1871–75 give the following results: estimated annual average population of the United Kingdom, 32,129,865; annual average of paupers, 1,109,608, or 3.4 per cent, distributed thus:

	Population.	Paupers.	Percentage.
England and Wales.....	23,355,535	920,030	3.9
Scotland.....	3,430,930	112,132	3.25
Ireland.....	5,343,400	77,446	1.4

The total expenditure for the same period was £47,532,756, or an annual average charge of 5s. 0¼d. per head of population, allocated thus:

	Amount of Assessment.	Per head per annum.	
	£	s.	d.
England and Wales.....	38,739,734	6	7½
Scotland.....	4,300,342	5	1½
Ireland.....	4,492,680	3	5

There is no poor-law in our Australian colonies, but benevolent asylums for the infirm and destitute have become general, and hospitals are numerous in all the rising towns in the gold-fields.—Compare Böckh's *Public Economy of Athens*, translated by sir G. C. Lewis; sir George Nichol's *History of the Poor-Laws*; Emmingham's *Poor Relief in different parts of Europe*, revised by E. B. Eastwick (1873); *Report of the Poor-Law Commissioners* (1835); *Reports of the Poor-law Commission and Poor-law Board* from 1835 to 1875.

POOR LAWS. The fundamental rule as to the relief of the poor was, that each parish in England and Wales is bound to maintain its own poor. For the purpose of providing the requisite machinery, overseers are required to be appointed in each parish every year on Mar. 25, or within a fortnight following; and these, along with the churchwardens, who are *ex officio* overseers, have the duty of providing the requisite funds. See **OVERSEERS**. This is done by means of a poor-rate, which the churchwardens and overseers may levy on all the occupiers of land in the parish, after such rate has been confirmed by the justices. The rate specifies a certain sum in the pound which is to be levied, and the annual value of the various lands is then specified, and the amount is thus easily computed. The rate is thus a local tax on the occupier of the land, and not on the owner, unless he himself is also occupier. In all cases, the duty of raising the funds attaches to the overseers; but the actual distribution and application of them are not always in their immediate control. Owing to the mischiefs arising from the officials of each parish distributing the funds at their discretion, without uniformity of plan, a central controlling power was created in 1834, in the shape of the poor-law board; and authority was given to combine various parishes into one poor-law union, for the purpose of greater uniformity as well as economy. When a union is formed, the control of the expenditure is chiefly vested in the guardians of this union, who are elected by each parish, and who supervise the management of the union work-house. They order the overseers of each parish to raise their due proportion of funds, by a contribution order issued to such overseers, who are thereon bound to levy the amount by including it in the next poor-rate. The guardians are bound to contract for the provisions, clothing, fuel, etc., supplied to the work-house, by means of sealed tenders, unless the quantity is less than a stated amount. All the controlling powers formerly vested in the poor-law board are now transferred to the local government board. The principle on which relief is administered to the poor is, that the condition of the pauper should not be so comfortable as that of the lowest independent laborer; otherwise, idleness and imposture would be encouraged to an indefinite extent. The guardians profess only to relieve destitution already existing, and not to enable persons to keep off impending destitution. Hence they only supply the bare necessaries of life. They cannot, for example, advance or lend money to set up a poor person in trade. Minute regulations are contained in the consolidated poor-law orders of the board as to the classification of paupers in the work-house, mode of admission, diet, discipline, and out-door relief. With regard to out-door relief and able-bodied paupers, it is provided that every able-bodied person requiring relief from any parish shall be relieved wholly in the work-house, together with his wife and family, if any, and if not otherwise employed. But the relief may be given out of doors in cases of sudden and urgent necessity, of sickness, accident, and a few other cases. In general, relief is confined to persons actually residing in some place within the union, except in case of casual destitution, or sickness and accident. Whenever out-door relief is given to an able-bodied person, half of it is to be in the form of articles of food or fuel. Relief is given only weekly, where the pauper is not required to be received into the work-house. No relief is to be given to able-bodied persons while they are employed for wages or hire by any person; and every able-bodied male person, if relieved out of the work-house, shall be set to work by the guardians, and kept so employed while he continues to receive such relief. The law with regard to the relief of the poor is so far qualified, that wherever a person applies for parochial relief, if he or she has a father or grandfather, mother or grandmother, or child, who is able to maintain such pauper, then the parish officers can obtain an order from justices to compel such relative to contribute a sum toward such maintenance. So husbands or fathers of paupers are bound to contribute to such maintenance. In all cases, the pauper is relieved either in the work-house or out of the work-house, according to the regulations of the poor-law orders. In some cases, the guardians or overseers may employ the poor in public works; but this is seldom done, except on occasions like the Lancashire distress. The law as to the settlement of the poor is somewhat intricate, and gives rise to much litigation. There are various grounds on which this settlement is acquired. Thus, every person has, *primâ facie*, a settlement in the parish where he was born, until some other is proved; and there are so many qualifications, that it is seldom a birth-settlement is resorted to. By marriage, a woman immediately acquires the settlement of her husband, if he has one, whether the husband be an Englishman or a foreigner. If the husband has no settlement, then the wife is thrown back on her maiden settlement. Formerly, a person acquired a settlement in a parish by hiring and service, and by residence for 40 days under such hiring; but since 1834, no such settlement can be acquired. If any person shall be bound an apprentice by indenture, and reside 40 days under such apprenticeship, he or she acquires a settlement thereby. So

whoever shall rent a tenement in a parish, and actually occupy the same, and be rated to the poor for one whole year, the rent being not less than £10, and paid by the person so actually occupying the tenement, shall acquire a settlement. So a person acquires a settlement by acquiring an estate in land, however small in value, and residing 40 days in the parish. So, if a person buy an estate, and the consideration amount to £30 at least, he shall thereby acquire a settlement. Formerly, a settlement was acquired by serving a public annual office, such as that of constable, overseer, etc.; but no settlement is now acquired on that ground. Unless a pauper has acquired a settlement on one or other of the grounds before mentioned in the parish or union where he receives relief, he is liable to be removed compulsorily to the parish where he last acquired a settlement. Certain persons, however, cannot be removed, and these are called irremovable paupers. Such are those paupers who have resided for one whole year in the parish or union in which they became destitute. The mode of computing this one year is, however, somewhat difficult in certain cases. The expense of maintaining the poor generally is paid out of the common fund, and not by each parish in the union. When a pauper is sought to be removed, it is necessary to take him before two justices of the peace for examination; and on proper evidence of his settlement, the justices will make the order of removal, which is an authority to the overseers to take or send the pauper to the overseers of the parish of settlement. If, however, the pauper is too ill at the time to admit of removal without danger, the justices may suspend the order of removal till he is recovered. Whenever a pauper is to be removed, the removing union is bound to give notice to the union of settlement; and it is on these occasions that so many obstinate and costly litigations take place as to which is the union of settlement. Much litigation was avoided by substituting a union for a parish as the test. The union also may appeal to the court of quarter-sessions against the removal order; and the quarter-sessions may state a case for the opinion of the court of queen's bench, if any nice point of law should arise, as frequently happens.

In Scotland, there was no systematic provision for the relief of the poor until 1845, when the statute of 8th and 9th Vict. c. 83 was passed. By this statute, a central board (called the board of supervision) was established, which controls the parochial board of each parish or union of parishes in a manner similar to the poor-law board in England. A settlement can be acquired in Scotland by residence of five years. Children follow the settlement of their parents, and wives that of their husbands; and if no other settlement be proved, then the settlement of birth is liable. In Scotland, the mode of assessment differs from that in England, where only the annual value of lands and tenements can be rated in the hands of the occupier. The parochial board had the option of three modes of assessment: 1. One half to be paid by owners, and one half by the occupiers; 2. One half to be paid by owners of lands, and the other half to be paid by all the inhabitants, according to means and substance other than lands; 3. Assessing owners of lands and other inhabitants ratably according to their means and substance. But by a later act of 24th and 25th Vict. c. 37, the mode of assessing means and substance is abolished. It will thus be seen that in Scotland the poor-rate can never be imposed wholly on the occupier as it always is in England.

In Ireland, a poor-law act was also, in 1838, passed, and numerous amending statutes have followed, the code of laws being substantially founded on the English acts.

There are special acts of parliament regulating the conditions on which paupers are removable between England, Scotland, and Ireland respectively.

POOR LAWS (*ante*), in the United States, are of local enactment. In some cases general laws have been passed by the state, but the town authorities usually adopt regulations for the care of the poor. The increase in pauperism in the years of business depression following the inflation period has led several states to pass what are known as "tramp-laws," defining more or less definitely the class of paupers generally called tramps, and making it a criminal offense for them to wander through the state without "visible means of support." The punishment for this offense in Connecticut is a year's imprisonment. Laws of this kind have met with criticism, both on the ground of unconstitutionality, and as harsh and oppressive. They have been generally administered with moderation and discrimination, and have without doubt been beneficial. In small towns the care of the poor is the duty of the board of selectmen. In some the barbarous custom of farming out the town poor to the lowest bidder still exists. As that town is required to support a pauper in which he has a legal settlement, and as the laws as to what constitutes such a settlement differ widely in the various states, legal questions are constantly arising. It would be impossible to give here even a summary of the state legislation as regards settlement. As a rule, married women follow the settlement of their husbands; legitimate children that of the father, or, if he have none, of the mother; and illegitimate children, of the mother. Settlement may be acquired in some states by residence for a certain time; others require residence and payment of taxes, or ownership of property to a fixed amount. The longest period of residence required is five years, in Maine, and the shortest 30 days, in Nebraska. Apprenticeship, followed by residence for one or more years, in most cases gives a settlement.

POORE, BEN PERLEY, b. Mass. 1820; edited the *Southern Whig* in Georgia 1838-40. He was historical agent of Massachusetts in France 1844-48, and during the same period

Foreign correspondent of the *Boston Atlas*. After his return he edited the *Boston Daily Bee*, and the *American Sentinel*. Since 1854 he has been Washington correspondent of the *Boston Journal*. Among his writings are *Rise and Fall of Louis Philippe* (1848); *The Conspiracy Trial* (1865); and *The Political Register and Congressional Directory* (1879).

POOR, LITTLE SISTERS OF THE. See SISTERHOODS.

POOR-RATE. See POOR; OVERSEERS.

POOR'S ROLL, in the practice of the law of Scotland, means the list of poor persons who are litigants, but unable to pay the fees of court, and therefore are allowed to sue *in formâ pauperis*. As this is considered a privilege, and enables the person to secure the services of counsel and agents gratuitously, it is only granted on production of a certificate by the minister of the parish and two elders, setting forth his circumstances to their own knowledge, and his general poverty. Notice is given of this to the adverse party, who is allowed time to inquire and oppose the application. When the court is satisfied of the poverty, the next thing is for the court to remit the matter to the counsel for the poor, of whom there are always two annually appointed by the faculty of advocates, generally young counsel, for the purpose; one of these counsel reports whether there is a *probabilis causa*, i. e., a good cause of action. If this report is made, it is considered conclusive, and the party is put on the poor's-roll. This warrant remains in force for two years, and during that time the pauper is exempt from all fees of court, and has the gratuitous services of counsel and agents. This provision for enabling paupers to carry on litigation, which is so complete in Scotland, is unknown in England or Ireland; for though a party may also be allowed there to sue *in formâ pauperis*, no provision is made by the court for giving him the gratuitous services of counsel and attorney; nevertheless, these sometimes volunteer to act gratuitously. See *IN FORMÂ PAUPERIS*.

POPAYAN, a city of the United States of Colombia (New Grenada), South America, stands in a fertile plain, 6,000 ft. above sea-level, on the Cauca, in lat. 2° 27' n. It contains a cathedral and a number of conventual edifices. It was founded in 1537, and was the first city built by Europeans in this region. Under the Spaniards it rose to considerable importance; but an earthquake in 1834, and the continued unsettled state of the country, have done much to reduce it. It is still of some consequence as a mart for agricultural produce. A great commercial road, about 1000 miles in length, leads from Popayan to Truxillo, in Peru. Pop. 20,000.

POPE (Gr. *papas*; Lat. *papa*, father), the title of the bishop of Rome, and supreme pontiff of the Roman Catholic church; applied also to all priests of the Greek and Russo-Greek church. Under very many heads occasions have arisen requiring reference more or less detailed to the authority and the privileges ascribed to the bishop of Rome by the church of which he is the head. We propose in the present article to explain briefly the titles of the pope, the manner of his election, the nature and functions of his office, and the authority ascribed to him by the different schools of Catholics; and finally the chronological succession of the bishops of Rome from the earliest ages to our own day.

1. The name "papa" (q. v.)—the Latin equivalent of pope—was originally used of all bishops. The first known writer who applies it to the Roman bishop as his specific title is Ennodius of Pavia, in the latter part of the 5th c., who thus addresses pope Symmachus. It is used also by Cassiodorus; and from his time gradually came to be reserved to this application, but it did not lose entirely its old and general use for many centuries later. In the modern ecclesiastical vocabulary the pope is called the "sovereign pontiff," the "vicar of Christ," the "head of the church," the "holy father," etc. He subscribes himself, since St. Gregory the great, *servus servorum Dei* (servant of the servants of God); and he is addressed as your holiness, your beatitude, etc.

2. The office of pope is elective. The electoral body, according to the present usage, is the college of cardinals. Primitively, the pope, as the other bishops, was elected by the clergy and people, although the rights of both were not the same. Some elections having been attended with violence, the electoral body was by degrees limited. At length, by a decree of Pope Nicholas II. in 1059, the right of election was vested in the cardinals. Provision was thus made for a representation of all the ancient electoral bodies; the cardinal bishops representing the bishops of the Roman synod, the cardinal priests, the parish clergy, and the cardinal deacons, the heads of the popular electoral districts (*regiones*) of the city. Preparatory to an election, the cardinals are shut up in what is called "the conclave," all communication with the outer world being interrupted until the election shall have been made. A simple majority of voices does not suffice—two-thirds of the cardinals must vote for the same candidate. There are four modes of election—"scrutiny," "access," "compromise," and "inspiration." Twice a day during the conclave each cardinal deposits, in a chalice placed on the altar, the name of his candidate. If the requisite number of votes are not found for any one, the papers are at once burned, and the smoke of the burning votes is a signal to the expectant crowd outside that no election has taken place. This is called the "scrutiny." If votes be added to those already given for one candidate, so as to make the required two-thirds, it is called "access." If the cardinals of two parties unite, it is called "compromise." If, by a public movement, a particular candidate be carried as if by acclamation, the election is said to be by "inspiration." The present pope, Pius IX.,

was elected in this way. The greater Catholic powers—France, Austria, and Spain—were formerly understood to have the privilege of placing a veto upon the election of *one* candidate; but this right was vague and undefined, and had no formal foundation in law. It is required by long usage, as a condition of election, that the candidate shall be an Italian. After election, the pope is enthroned, enters upon possession of his see, and finally, is solemnly crowned. The ceremonial of consecration is very splendid and deeply impressive. One of the ceremonies—that of burning a bunch of flax before him, with the words, “Holy father, thus passeth away the glory of the world!”—has often been cited for its highly symbolical character, as well as for its dramatic effect. Cardinals, in order to vote, must be present at the conclave—no voting by proxy is permitted. Some of these conditions are practically set aside by the cessation of the status of the pope as an Italian temporal sovereign, and it is not unlikely that the forms of election may be modified by special legislation. It has even been alleged that the present pope has prepared a special bull regulating the time, place, and order of the election of his successor.

3. The general nature of the office of the pope may be inferred from his reputed character as successor of St. Peter, and vicegerent of Christ on earth, whence follow all the powers necessary for the practical government of the church. Hence he is held (1) to possess over the entire church, and each of its parts, a supreme authority, not indeed arbitrary, but regulated by the law of God and by the canons. He has power (2) to examine and decide authoritatively all controversies; (3) to convoke councils; (4) to revise and confirm their decrees; (5) to issue general decrees, whether upon discipline and morals, or upon doctrine; (6) he is the center of communion, separation from which involves the forfeiture of the communion of the whole church; (7) he has *ultimate* authority to appoint bishops in all parts of the church, and however this right may be exercised in the first instance, as by the sovereign, by the clergy, or by a synod of bishops, it rests with him to confirm episcopal elections, no matter how made, and to grant “canonical institution;” (8) he can also deprive bishops and set others in their place, and can even, in cases of great emergency, suppress bishoprics and change their limits according to existing requirements; (9) he has authority to judge of the doctrine taught in particular books, or by particular individuals, and to pronounce authoritatively as to its conformity with the Catholic faith, or the contrary. This privilege formed the subject of the great controversy with the Jansenists as to what are called “dogmatic facts.”

4. All Catholics are agreed that the pope, as primate, possesses, by divine law, and in virtue of his office, full governing authority over the entire church. Of the exercise of such power they find traces in history from the earliest times. Roman Catholic historians trace the history of the pope’s primacy in St. Clement’s letters to the church of Corinth, in the action taken by Victor in the Paschal controversy, and by Stephen and Cornelius in the controversy on rebaptizing heretics; in the deposition of Marcian, bishop of Arles, at the instance of Cyprian, by pope Stephen; in the leading part taken by the popes in the condemnation of Donatus and of the Pelagian heresy; and, perhaps, more than all, in the appeals made from various parts of the church by persons excommunicated by their own bishops, and the rehearing at Rome of such causes, and the confirmation or reversal of the sentence according to the result of the trial. These several facts, however, although to Catholics they appear evidences of the papal supremacy, are explained by Protestant writers in a sense which does not suppose any permanent supremacy on the part of the Roman see, and which they hold to be reconcilable with the full independence of national churches; and it is admitted by Catholics themselves, while they contend that the instances to which they appeal imply a real exercise of primacy from the beginning, that the details of that primacy have undergone a gradual and extensive development in the progress of the church. Up to the date of the late Vatican council great differences of opinion existed between the Gallican and the ultramontane schools as to the extent and nature of the papal authority, whether decrees of doctrine or in the government of the church. As to the former, all agreed that the judgment of the pope, in concert with the body of bishops, was infallible; but they differed as to papal decrees on doctrine issued by the pope alone, *ex cathedrâ*, and addressed to the whole church, although both agreed as to the duty of respectful obedience on the part of all, until the general sense of the church should have been ascertained; and should no reclamation on the part of the church take place, the decree of the pope was held to be, in the opinion of both the contending schools, as infallible; and the doctrine propounded therein was allowed to be recognized as a question of faith, which had been sanctioned with the ultimatum of infallibility. See GALICANISM. But the ultramontanes held that a doctrinal decree issued, *ex cathedrâ*, is infallible, *ipso facto*, and independently of any reference to the church dispersed. As to the government of the church, the ultramontanes held the pope to be supreme, and thus to be superior to general councils, and independent of their decrees. The Gallicians, on the contrary, held that a general council is superior to the pope, and has power to bind him by its decrees. Further, the ultramontanes held that the pope is the source of all jurisdiction in the church, and that the bishops derive their powers *through him* from Christ. The Gallicians regarded the episcopal power as received directly from Christ by virtue of the episcopal office. This difference of opinion leads to many controversies of detail as to

the respective rights and powers of the pope and the bishop in the several dioceses, regarding which it is only necessary to indicate the general ground of difference of opinion. With regard to all, it may be said that both on the question of infallibility and on all its practical consequences, the ultramontane view, although not in its most extreme form, has received the sanction of the late Vatican council.

5. The chronology of the papacy in the 1st c. is very obscure. The enumerations in the ancient writers are imperfect, and they differ as to the exact order of succession. The two most ancient catalogues, those of Irenæus and Augustine, differ in more than one particular. The chief difficulty regards Linus and Cletus. The former is believed to have been the vicegerent of Peter during the interval between his first coming to Rome and his final residence there. He would, therefore, have been at once the contemporary of Peter and his successor (though but for a very brief period). The difficulty as to Cletus arises from the doubt whether he be the same person with Anacletus. We subjoin a catalogue drawn up after the most careful modern authorities, and arranged according to centuries:

	FIRST CENTURY.	A.D.
St. Peter.....		41-67
Linus.....		68
Cletus, or Anacletus.....		uncertain date
Clement I.....		uncertain date
SECOND CENTURY.		
Evaristus.....		about 100
Alexander I.....		about 109
Sixtus I., Roman.....		127
Telesphorus, Greek.....		133
Hyginus, Athenian.....		142
Pius I., native of Aquileia.....		151
Anicetus, Syrian.....		161
Soter, Greek.....		170
Eleutherus, Greek.....		185
Victor I., African.....		197
Zephyrinus.....		197
THIRD CENTURY.		
Callixtus I., Roman.....		217
Urban I., Roman.....		222
Pontianus, Roman.....		230
Antherus, Greek.....		235
Fabianus, probably Roman.....		236
Cornelius, Roman.....		252
(Novatianus, first antipope.)		
Lucius I., Roman.....		253
Stephen I., Roman.....		253
Sixtus II., Roman.....		257
Dionysius, Greek.....		259
Felix I., Roman.....		270
Eutychianus, uncertain.....		275
Caius, Roman.....		283
Marcellinus, Roman.....		296
FOURTH CENTURY.		
Marcellus I., Roman.....		308
(Marcellinus having died in 304 or 305.)		
Eusebius, Greek.....		310
Melchhiades, African.....		310
Sylvester I., Roman.....		314
Marcus, Roman.....		336
Julius I., Roman.....		337
Liberius, Roman.....		352
(Felix II., antipope.)		
Damasus I., Spaniard.....		366
(Ursicinus, antipope.)		
Siricius, Roman.....		384
Anastasius I., Roman.....		398
FIFTH CENTURY.		
Innocent I., native of Albano.....		401
Zosimus, Greek.....		417
Boniface I., Roman.....		418
Celestinus I., Roman.....		422
Sixtus III., Roman.....		432
Leo I., Roman, called "the Great".....		440
Hilarius, native of Sardinia.....		461
Simplicius, native of Tibur.....		467
Felix III., Roman.....		483
Gelasius I., Roman.....		492
Anastasius II., Roman.....		496
Symmachus, native of Sardinia.....		498
SIXTH CENTURY.		
Hormisdas, native of Frusino.....		514
John I., Tuscan.....		523
Felix IV., native of Beneventum.....		526
Boniface II., Roman.....		530
John II., Roman.....		532
Agapetus I., Roman.....		535
Silverius, native of Campania.....		536
Vigilius, Roman.....		540

	A. D.
Pelagius I., Roman.....	555
John III., Roman.....	560
Benedict I., Roman.....	574
Pelagius II., Roman.....	578
Gregory I., Roman, styled "the Great".....	590

SEVENTH CENTURY.

Sabinianus, native of Tuscany.....	604
Boniface III., Roman.....	607
Boniface IV., native of Abruzzi.....	608
Deusedit or Deodatus I., Roman.....	615
Boniface V., Neapolitan.....	619
Honorius I., native of Capua.....	625
Severinus, Roman.....	638
John IV., native of Dalmatia.....	640
Theodorus I., Greek.....	641
Martin I., native of Tudertum.....	649
Eugenius I., Roman.....	654
Vitalianus, native of Signa.....	657
Deusedit II., Roman.....	672
Domnus I., Roman.....	676
Agathon, Sicilian.....	678
Leo II., Sicilian.....	682
Benedict II., Roman.....	684
John V., native of Syria.....	685
Conon, native of Thrace.....	686
Sergius I., native of Palermo.....	687

EIGHTH CENTURY.

John VI., native of Greece.....	701
John VII., native of Greece.....	705
Sisinius, native of Syria.....	708
Constantine, Syrian.....	708
Gregory II., Roman.....	715
Gregory III., Syrian.....	731
Zacharias, Greek.....	741
Stephen II.....	753
Stephen III., Roman.....	753
Paul I., Roman.....	757
Stephen IV., Sicilian.....	763
Adrian I., Roman.....	772
Leo III., Roman.....	795

NINTH CENTURY.

Stephen V., Roman.....	816
Paschal I., Roman.....	817
Eugenius II., Roman.....	824
Valentinus, Roman.....	827
Gregory IV., Roman.....	827
Sergius II., Roman.....	843
Leo IV., Roman.....	847

In this interval is placed the fabulous pope Joan (q.v.)

Benedict III., Roman.....	855
Nicholas I., Roman.....	858
Adrian II., Roman.....	867
John VIII., Roman.....	872
Martin II. (called also Marinus I.).....	882
Adrian III., Roman.....	884
Stephen VI., Roman.....	885
Formosus, bishop of Porto.....	891
(Sergius and Boniface VI., antipopes.)	
Stephen VII., Roman.....	896
Romanus, Tuscan.....	897
Theodorus II., Roman.....	897
John IX., native of Tibur.....	897

TENTH CENTURY.

Benedict IV., Roman.....	900
Leo V., native of Ardea.....	903
(Christopher, antipope.)	
Sergius III.....	904
Anastasius III., Roman.....	911
Lando, native of Sabina.....	913
John X., Roman.....	914
Leo VI., Roman.....	928
Stephen VIII., Roman.....	929
John XI.....	931
Leo VII., Roman.....	936
Stephen IX., Roman.....	939
Martin III. (called by some Marinus II.).....	943
Agapetus II.....	946
John XII, Ottaviano Conti.....	956
He was the first who changed his name on his elevation.	
(Leo VIII., antipope.)	
Benedict V., Roman.....	963
John XIII., Roman.....	964
Benedict VI.....	965
Domnus II., Roman.....	972
Benedict VII. (Conti), Roman.....	973
John XIV.....	974
(Boniface VII., Franco, antipope.)	
John XV., Roman.....	983
John XVI., Roman.....	985
Gregory V., German.....	986
Sylvester II., Gerbert, native of Auvergne.....	986

ELEVENTH CENTURY.

	A. D.
John XVII. (May—October).....	1008
John XVIII., Roman.....	1008
Sergius IV., Roman.....	1009
Benedict VIII., native of Tusculum.....	1012
John XIX., Roman (in some catalogues reckoned XX.: the diversity arising from a disputed election).....	1024
Benedict IX.....	1033
(Sylvester, antipope.)	
Gregory VI., Roman.....	1044
Clement II., native of Saxony.....	1047
Damasus II. (Poppo).....	1048
Leo. IX., bishop of Toul.....	1049
Victor II., bishop of Eichstadt.....	1055
Stephen X., Frederick, abbot of Monte Casino.....	1057
Benedict X., by some styled antipope, abdicated.....	1058
Nicholas II., native of Burgundy.....	1059
Alexander II., native of Milan.....	1061
Gregory VII., Hildebrand, native of Tuscany.....	1073
(Guibert, antipope, assumed the name of Clement III.)	
Victor III., native of Beneventum.....	1086
Urban II., native of France.....	1088
Paschal II., native of Tuscany.....	1099
(Albert and Theodorik, antipopes.)	

TWELFTH CENTURY.

Gelasius II., native of Caieta.....	1118
Callixtus II., native of Burgundy.....	1119
Honorius II., Cardinal Lambert, Bishop of Ostia.....	1124
Innocent II., Roman.....	1130
(Anacletus, antipope.)	
Celestinus II., Tuscan.....	1143
Lucius II., native of Bologna.....	1144
Eugenius III., native of Pisa.....	1145
Anastasius IV., Roman.....	1153
Adrian IV., Nicholas Breakspere, Englishman.....	1154
Alexander III., Cardinal Orando Bandinelli, native of Siena.....	1159
(Victor, Paschal, and Callixtus, antipopes.)	
Lucius III., Cardinal Ubaldo of Lucca.....	1181
Urban III., Uberto Crivelli, Archbishop of Milan.....	1185
Gregory VIII., native of Beneventum.....	1187
Clement III., Paul, Bishop of Præneste.....	1188
Celestinus III., Cardinal Hyacinthus, Roman.....	1191
Innocent III., Cardinal Lotharich, native of Signia.....	1198

THIRTEENTH CENTURY.

Honorius III., Cardinal Savelli, native of Rome.....	1216
Gregory IX., Cardinal Hugo, native of Anagni.....	1227
Celestinus IV., native of Milan.....	1241
Innocent IV., Cardinal Sinibaldo Fieschi, native of Genoa.....	1242
Alexander IV., Cardinal Rinaldo Conti, native of Anagni.....	1254
Urban IV., James, Patriarch of Jerusalem, Frenchman.....	1261
Clement IV., Guy, native of St. Gilles, in Languedoc.....	1265
Gregory X., Tebaldo Visconti, native of Piacenza.....	1272
Innocent V., Cardinal Peter, native of Tarentaise.....	1276
Adrian V., Ottobono Fieschi, native of Genoa.....	1276
John XXI., native of Lisbon.....	1276
Nicholas III., Cardinal Orsini, native of Rome.....	1277
Martin IV., Cardinal Simon de Brie, Frenchman.....	1281
Honorius IV., Cardinal James Savelli, native of Rome.....	1285
Nicholas IV., Cardinal Jerome, native of Ascoli.....	1288
Celestinus V., Pietro da Morrone of Abruzzi.....	1294
Boniface VIII., Cardinal Benedetto Gaetani, native of Anagni.....	1295

FOURTEENTH CENTURY.

Benedict XI., Cardinal Nicholas, native of Treviso.....	1303
Clement V., Bertrand of Bordeaux, removed the papal see to Avignon.....	1305
John XXII., James, native of Cahors, in France.....	1316
(Nicholas, antipope.)	
Benedict XII., James Fournier, Frenchman.....	1334
Clement VI., Peter Roger, native of Limoges in France.....	1342
Innocent VI., Stephen Aubert, native of Limoges.....	1352
Urban V., William Grimoard, Frenchman.....	1362
Gregory XI., Peter Roger, Frenchman, restored the papal see to Rome.....	1370
Urban VI., Bartolomeo Prignano, Neapolitan.....	1378
(From 1378 to 1410 occurs the great Western schism, during which, in conflict with the line of popes inserted in the catalogue, is found a rival line residing at Avignon—Clement VII., 1378-94; Benedict XIII., 1394-1410. The Council of Pisa, 1410, deposed both rival popes; but Benedict XIII. remained in schism till his death in 1434.)	
Boniface IX., Peter Tomacelli of Naples.....	1389

FIFTEENTH CENTURY.

Innocent VII., Cosmo Migliorati, native of Sulmona.....	1404
Gregory XII., Angelo Corradi, native of Venice.....	1406
Alexander V., Peter Philargius, native of Candia.....	1409
John XXIII., Cardinal Cossa, deposed by the Council of Constance.....	1410
Martin V., Otho Colonna, Roman.....	1417
Eugenius IV., Gabriel Condulmero, Venetian.....	1431
(Felix, antipope.)	
Nicholas V., Cardinal Thomas, native of Sarzana.....	1447
Callixtus III., Alfonso Borgia, Spaniard.....	1455
Pius II., Eneas Sylvius Piccolomini, native of Siena.....	1458
Paul II., Peter Barbo, native of Venice.....	1464

Pius VIII., Cardinal Castiglioni, native of Cingoli.....	1829
Gregory XVI., Mauro Cappellari, native of Belluno.....	1831
Pius IX., Giovanni Maria Mastai-Ferretti, native of Sinigaglia.....	1846
Leo XIII., Gioacchino Pecci, native of Carpineto.....	1878

Protestants generally object to the list of popes given by Roman Catholics, that there is no absolutely conclusive evidence of the apostle Peter's ever having been at Rome; although most of them admit the probability that he was there, and suffered martyrdom there. But they deny that there is any evidence whatever of his having exercised the office of bishop either there or anywhere else. They call in question many other of the names and dates in the earlier part of the list, not so much disputing the existence of the persons named, as their exercise of the office of bishop in Rome, and still more their right to be considered bishops of Rome. According to Protestants in general, the papacy grew, by a gradual assumption of power, out of an ordinary bishopric, through the advantage of metropolitan position and influence, and was afterward supported by the fable—as they deem it—of the see of St. Peter.

POPE. See RUFFE.

POPE, a co. in n.w. Arkansas, bounded on the s.w. by the Arkansas river, and drained by the Illinois bayou, Big Piney creek, and smaller streams; traversed by the Little Rock and Fort Smith railroad; 900 sq.m.; pop. '80, 14,325. The surface is lilly, and largely covered with forests; the soil is fertile. Cattle, corn, cotton, and lumber are the principal products. Coal is also found here. Co. seat, Dover.

POPE, a co. in s.e. Illinois, divided from Kentucky on the s.e. by the Ohio river; drained by Big Bay and Lusk creeks; 374 sq.m.; pop. '80, 13,259. The surface is hilly, with forests of walnut, oak, ash, hickory, cypress, and tulip trees; the soil is fertile, and corn, wool, cotton, and tobacco are raised. It contains carboniferous limestone, mineral springs, and kaolin. Co. seat, Golconda.

POPE, a co. in w. c. Minnesota, drained by the Chippewa river, a branch of the Minnesota, and traversed by the St. Paul and Pacific railroad; 720 sq.m.; pop. '80, 5,874. The surface is partly undulating, with considerable prairie land, and dotted over with a number of small lakes, some of which have no apparent outlet. The soil is fertile; principal products, wheat, oats, hay, and cattle. Co. seat, Glenwood.

POPE, ALEXANDER, an eminent English poet, was born in London, May 21, 1688. His parents were Roman Catholics, and to this faith the poet also nominally adhered,

thus debarring himself from public office and employment. His father, a linen-merchant, saved a moderate competency, and received some accession of fortune by his marriage with Edith Turner, his second wife, and the poet's mother, a lady of a good Yorkshire family. He then withdrew from business, and settled on a small estate he had purchased at Binfield in Wind-or forest. He died at Chiswick in 1717. His son shortly afterward took a long lease of a house and five acres of land at Twickenham, on the banks of the Thames, whither he retired with his widowed mother, to whom he was tenderly attached, and where he resided till his death, cultivating his little domain with exquisite taste and skill, and embellishing it with a grotto, temple, wilderness, and other adjuncts poetical and picturesque. In this famous villa Pope was visited by Frederick, prince of Wales, and by the most celebrated wits, statesmen, and beauties of the day, himself being the most popular and successful poet of his age. Pope's early years were spent at Binfield, within the range of the royal forest. He received some education at little Catholic schools, but was his own instructor after his twelfth year. He never was a profound or accurate scholar, but he read the Latin poets with ease and delight, and acquired some Greek, French, and Italian. He was a poet almost from infancy; he "lisped in numbers," and when a mere youth, surpassed all his contemporaries in metrical harmony and correctness. His pastorals and some translations appeared in Tonson's *Miscellany* in 1709, but were written three or four years earlier. These were followed by the *Essay on Criticism*, 1711; *Rape of the Lock* (when completed, the most graceful, airy, and imaginative of his works), 1712-14; *Windsor Forest*, 1713; *Temple of Fame*, 1715. In a collection of his works printed in 1717 he included the *Epistle of Eloisa*, and *Elegy on an Unfortunate Lady*, two poems inimitable for pathetic beauty and finished melodious versification. From 1715 till 1726 Pope was chiefly engaged on his translations of the *Iliad* and *Odyssey*, which, though wanting in true Homeric simplicity, naturalness, and grandeur, are splendid poems. They realized to the fortunate and fashionable translator a sum of about £8,000. He next edited an edition of Shakespeare, which proved unworthy of his reputation. In 1728-29, he published his greatest satire—the *Dunciad*, an attack on all poetasters and pretended wits, and on all other persons against whom the sensitive poet had conceived any enmity. In 1737 he gave to the world a volume of his *Literary Correspondence*, containing some pleasant gossip and observations, with choice passages of description; but it appears that the correspondence was manufactured for publication, not composed of actual letters addressed to the parties whose names are given, and the collection was introduced to the public by means of an elaborate stratagem on the part of the scheming poet. Between the years 1731 and 1739 he issued a series of poetical essays, moral and philosophical, with satires and imitations of Horace, all admirable for sense, wit, spirit, and brilliance. Of these delightful productions, the most celebrated is the *Essay on Man*, to which Bolingbroke is believed to have contributed the spurious philosophy and false sentiment; but its merit consists in detached passages, descriptions, and pictures. A fourth book to the *Dunciad*, containing many beautiful and striking lines, and a general revision of his works, closed the poet's literary cares and toils: he died on May 30, 1744, and was buried in the church at Twickenham. Pope was of very diminutive stature, and deformed from his birth. His physical infirmity, susceptible temperament, and incessant study rendered his life "one long disease." He was, as his friend, lord Chesterfield, said, "the most irritable of all the *genus irritabile vatum*, offended with trifles, and never forgetting or forgiving them." His literary stratagems, disguises, assertions, denials, and (we must add) misrepresentations, would fill volumes. Yet Pope, when no disturbing jealousy, vanity, or rivalry intervened, was generous and affectionate, and he had a manly, independent spirit. As a poet he was deficient in originality and creative power, and thus was inferior to his prototype, Dryden; but as a literary artist, and brilliant declaimer, satirist, and moralizer in verse, he is still unrivaled. He is the English Horace. Of the many lives, that by Carruthers is one of the best (1857); the editions are innumerable.

POPE, JOHN, b. Ill., 1823; graduated at West Point 1842, and was brevetted second lieut. of topographical engineers; served in Florida 1842-44; on the survey of the n.e. boundary line 1845-46; in the Mexican war, during which he was brevetted first-lieut. and capt. for gallantry at Monterey and Buena Vista, 1846-48; in surveys and explorations in Minnesota 1849-50; as chief topographical engineer in New Mexico 1851-53; in charge of the survey of the Pacific railroad route, near the 32d parallel of latitude, and in experiments for obtaining water on the Llano Estacado by boring artesian wells, 1853-59, during which time he was made capt. of topographical engineers in reward for services continuing through 14 years; and in light-house duty 1859-60. At the outbreak of the rebellion he was made brig. gen. of volunteers 1861, and assigned command of the district of northern Missouri; afterward commanded the army of the Mississippi, and was made maj. gen. of volunteers, Mar., 1862; was called to the e. and assigned command of the army of Virginia, with which he fought the battles of Cedar Mountain, Bull Run (second), and the skirmish at Chantilly. He was made brig. gen. in the regular army, July, 1862; and in September, at his own request, was re-assigned to the command of the department of the north-west; was made brevet maj. gen. in the regular army, Mar., 1865, and from January to June of that year commanded the military divi-

tion of the Missouri. Having been mustered out of the volunteer service after the suppression of the rebellion, he was placed in command of the department of the Missouri, with his headquarters at fort Leavenworth. He is the author of *Explorations from the Red River to the Rio Grande*, contained in the *Pacific Railroad Reports*, vol. iii.; and of *The Campaign in Virginia, July and August, 1862*.

POPERINGHE, an old commercial t. of Belgium, in the province of West Flanders, four m. from the French frontier. The town is walled, and has manufactures of lace, linens, and woolen cloths. Hops are grown in the surrounding district. Pop. '70, about 11,000.

POPERY literally means attachment to the religion or to the party of the pope; and in this sense the word is synonymous with the profession of the Roman Catholic religion. In its use, however, it has come to involve the idea of contempt or disparagement. It may therefore be said that the word is either intended to designate what are regarded by Protestants as the most exaggerated and superstitious among the doctrines and practices which they ascribe to Catholics, in contradistinction to the belief of the more moderate members of that church, or is designedly employed as an expression of contempt and depreciation.

POPHAM, GEORGE, 1550-1608; b. Eng.; embarked in 1607 with two ships and 100 men for America; landing at the mouth of the Kennebec river, they built a store-house and a fortification which they called fort St. George. This was the first English settlement in New England. Popham having died the following year, the colonists, disheartened by the severity of the climate, returned in the spring to England.

POPISH PLOT, the name given to an imaginary plot, on the part of the Roman Catholics in England during the reign of Charles II., the object of which was believed to be a general massacre of the Protestants. See OATES, TITUS.

POPLAR, *Populus*, a genus of trees, forming, along with willows, the whole of the natural order *salicaceæ* or *salicineæ* (by some regarded as a suborder of *amentaceæ*), and having dioecious flowers arranged in catkins, both male and female flowers with an oblique cup-shaped perianth. The seeds have silky hairs, as in willows, and are readily wafted about by the wind. The species are numerous, chiefly natives of the temperate and cold regions of the northern hemisphere. They are large trees of rapid growth, with soft wood; and broad, heart-shaped, ovate, triangular, or lozenge-shaped, deciduous leaves, on rather long stalks. Many of them are very beautiful trees. The catkins appear long before the leaves, and proceed from distinct lateral buds. Few of the poplars are of much value for their timber, which is generally white, soft, and light; but, from their rapid growth, they are useful as yielding firewood, where the scarcity of other fuel renders it necessary to plant trees for this purpose, and they are often planted as ornamental trees, producing an immediate effect of embellishment in a bare situation more readily than almost any other kind of tree. Besides the species known by the name aspen (q. v.), or tremulous poplar, the following seem the most worthy of notice: The **WHITE POPLAR**, or **ABELE** (*P. alba*), a native of the southern parts of Europe, and reckoned among British trees, but probably not indigenous in Britain, is a tree of 80 ft. or upward; with a fine spreading head; and roundish, heart-shaped, lobed, and toothed leaves, which are smooth, shining, and dark-green above, downy and silvery-white beneath. The wood is used by cabinet-makers, turners, and toy-makers. It is little liable to swell or shrink, which adapts it for various purposes. The tree loves low situations and clay soils. This tree has of late years suffered in Britain from some unknown cause, like the potato, dying where it previously flourished; while other poplars, the most nearly allied, continue to flourish in the same localities.—The **GRAY POPLAR** (*P. canescens*) is very similar to the white poplar, but of more vigorous growth, a large spreading tree; the leaves similar to those of the white poplar, but not so dark-green above or so white beneath. It is not of so rapid growth as the white poplar; and its wood is harder and better, makes good flooring, and is preferable to pine-deal for the neighborhood of fire-places, being less apt to take fire; it is also used for coarse doors, carts, barrows, etc., and not being liable to warp, is esteemed by wood-carvers. The tree generally begins to rot in the heart when forty or fifty years old. Like most of the other poplars, it fills the ground round it with suckers. Like the white poplar, it is a very doubtful native of Britain, and belongs to the center and south of Europe.—The **BLACK POPLAR** (*P. nigra*), a native of most parts of Europe, and perhaps of England, is a tree of 50 to 80 ft. high, with an ample spreading head, viscid leaf-buds, and deltoid or unequally quadrangular, perfectly smooth leaves. The wood is used for the same purposes as that of the white and gray poplars. The "cotton" from the seeds has been used in France and Germany for making cloth hats and paper, but these uses of it were not found profitable.—The **LOMBARDY POPLAR** (*P. fastigiata* or *dilatata*) is perhaps a mere variety of the black poplar, with erect instead of spreading branches. It appears to have been introduced into Europe from the east. It is very common in the Punjab and in Persia, and now also in Lombardy and other parts of Italy. It attains a height of 100 or even 150 ft., and is remarkable for its erect form, contracted head, and very rapid growth. It is often planted as an ornamental tree, although not so generally as in the end of last century, when it was thought preferable for ornamental purposes to every

other tree. It is common in the streets and squares of towns in all parts of Britain; and is particularly adapted to situations where a long horizontal line of any kind fatigues the eye, or as seen starting up from a mass of lower wood or shrubbery, but has a besom-like appearance when planted in unsuitable situations. The wood is of almost no value. It is generally propagated by layers.—The species commonly known as BLACK ITALIAN POPLAR (*P. monilifera* or *acledesca*), although it is really a native not of Italy, but of North America, and is sometimes more correctly called CANADIAN POPLAR, the female catkins of which resemble a string of pearls, is frequently planted both as an ornamental tree and for the sake of its timber, which is useful for flooring, etc. The leaves are deltoid. It is of very rapid growth, and attains a height of 100 to 120 feet.—The BALSAM POPLAR, or TACAMAHAC (*P. balsamifera*), a very common ornamental tree in Britain, is a native both of North America and of Siberia, and has whitish, ovate-oblong leaves, which in spring are of a delicate yellow tint, and have an agreeable fragrance. The leaf-buds are viscid. The erect fastigate manner of growth approaches that of the Lombardy poplar. The resinous exudation of the buds (*tacamahac*) is said to be diuretic and antispasmodic; and an ointment made from the buds is used for tumors, wounds, and burns. The resinous exudation of the buds of other species, as the black poplar, possesses similar properties.—The COTTON-WOOD (*P. Canadensis*) of North America, particularly abundant on the upper parts of the Mississippi and Missouri, is valued as a timber tree, and has been pretty extensively planted in Britain; as has also the ONTARIO POPLAR (*P. canadensis*), a species with the same balsamic character as *P. balsamifera*, and chiefly distinguished from it by its larger leaves. In size of leaf no other species equals *P. heterophylla*, a native of the southern states of North America, the leaves of which are often six inches long.

POPLIN (Fr. *papeline*). In the 15th c., a fabric was woven in Avignon called *papeline*, which was made of silk, and was much esteemed. An attempt to imitate it was introduced into England, and the name was corrupted to *poplin*, which has been adopted abroad as well as at home. In 1775 the manufacture was introduced to Ireland by French Protestant refugees, and from that time to the present, Irish poplins have been famous. What the exact nature of the original *papelines* was is not certainly known; but the best modern poplins consist of a warp of silk and a weft of worsted, which gives substance, combined with great softness and elasticity, to the material. Cotton, and even flax yarns are substituted for silk, wholly or partially, in making cheap goods; but they are very far inferior in beauty to the true poplins.

POPOCATEPETL (Aztec, *popoca*, to smoke, and *tepetl*, a mountain), or in Spanish, *Volcan Grande de Mexico* (grand volcano of Mexico), a mountain about 10 m. s.w. of the city of Mexico. It rises in the form of a cone to a height of 17,720 ft. above the sea-level, and is composed chiefly of porphyritic obsidian. Forests girdle its lower parts; but, at an elevation of 13,000 ft., all vegetation ceases. About the period of the Spanish conquest it was very active, but no eruption has been recorded since 1540. It still smokes, however. Cortez, the conqueror of Mexico, attempted to reach its summit, but was unable to do so, on account of the masses of snow that covered it. This feat was first achieved by Francisco Mantano, one of Cortez's followers, who not only climbed to the top of the mountain, but had himself let down its crater, by means of ropes, to a depth of about 450 feet. In 1827, it was again scaled by the brothers Glennie, who determined its altitude barometrically, and since then this laborious exploit has been several times performed, and even by ladies.

POPPINJAY, a name of the green woodpecker (*Picus viridis*), a bird common in most of the wooded districts of England and Scotland. See WOODPECKER.

POPPY, *Papaver*. a genus of plants of the natural order *papaveracea*, having a calyx of 2 (or rarely 3) sepals, which very soon fall off; a corolla of 4 (rarely 6) petals; numerous stamens seated on a receptacle; the stigma crowning the germen, without a style, and in the form of 4-20 rays; the capsule opening by pores under the persistent stigma, imperfectly divided into cells by partitions as numerous as the rays of the stigma, but which do not reach the center; the seeds extremely numerous. There are numerous species of poppy, mostly natives of Europe and Asia, some of them found even in very northern regions, but most of them in the warmer temperate parts. They are rather large herbaceous plants, annual or perennial, mostly sprinkled with bristly hairs. They have a white milky juice; a disagreeable narcotic smell, particularly when bruised; pinnatifid or bipinnatifid leaves, more rarely jagged or toothed leaves; and large showy flowers, which readily become double by cultivation. The capsules are curious, from the manner in which they fling out their seeds when the plant is shaken by the wind; each capsule being somewhat like a round or oval pepper-box, with holes, however, not in the top, where rain might get in by them, but under the rim. By far the most important species is that known as the OPIUM POPPY (*P. somniferum*), also called the WHITE POPPY, and the OIL POPPY. See OPIUM. But the same species is important on account of the bland fixed oil of the seeds, and is much cultivated as an oil-plant. *Poppy oil* is as sweet as olive oil, and is used for similar purposes. It is imported into Britain in considerable quantities from India. The poppy is also extensively cultivated for it in France, Belgium, and Germany. The use and manufacture of this oil were for a long time, during last century, strictly prohibited in France, from a mistaken notion that it must partake of the

narcotic properties of the milky juice of the plant. The seed, however, contains no opium or any narcotic principle, and was well known to the ancients as a pleasant article of food, fit to be eaten by itself or with bread. The oil expressed from it is perfectly wholesome, and is much used in France and elsewhere as an article of food. Fully one-half of the oil used for cooking and otherwise for alimentary purposes in France is of this kind. The seeds yield about 40 per cent of oil, and the oil-cake is useful for manure or for feeding cattle. The oil is sometimes used by painters and by soap-boilers; but it is not good for burning. In the cultivation of the poppy for oil the seed is often sown in autumn, where the severity of the winter-frosts is not to be feared; in more northern parts it is sown in spring, and sometimes the seed is scattered on the top of the snow with which the ground is covered. Being very small, it needs little or no harrowing. Early sowing is favorable to the size of the plant, and the abundance of produce. Hoeing and thinning are advantageous. An open but rich soil is best for the poppy; and a sheltered situation is necessary, as in exposed situations, much of the seed is scattered by the wind. The poppy does not exhaust the land so much as colza, rape, and some other oil-plants. Harvesting ought to begin when one-fourth of the capsules of each plant are open. It is accomplished by pulling the plants in such a manner as not to shake the seed out of the capsules, and tying them in sheafs, which are placed together in an erect or slightly sloping position, till the ripening of the capsules is completed, when the seed is taken out by shaking the capsules into a tub or on a cloth, great care being used to prevent any earth from the roots from getting mixed with them. Some farmers in Flanders sow poppy in alternate rows with carrots. The variety of poppy chiefly cultivated as an oil-plant has flowers of a dull reddish color, large oblong capsules, and brownish seeds; but the white-flowered variety, with globular capsules and white seeds, is also used.—The **ORIENTAL POPPY** (*P. orientale*), a native of Armenia and the Caucasus, a perennial species, is often planted in gardens on account of its very large, fiery-red flowers. Its unripe capsules have an acrid, almost burning taste; but are eaten by the Turks, and opium is extracted from them.—Several species are British, all of them local, rare in some places, and troublesome weeds in corn-fields in other places apparently quite similar in climate. Among them is the **CORN POPPY** or **COMMON RED POPPY** (*P. rhoeas*), with bright red flowers, and deeply pinnatifid leaves. The petals are mucilaginous and slightly bitter; they have a slight narcotic smell, and a syrup made of them, is sometimes used as an anodyne in catarrhs and children's complaints; but they are more valued for the rich red color which they yield. A variety with double flowers is cultivated in flower-gardens, under the name of *eamation poppy*. Among the ancients the poppy was sacred to Ceres.

POPPY-HEAD, a carved ornament, used as a finial on top of bench-ends, etc: In early examples it is a simple fleur-de-lis, but in late Gothic this and other wood-work becomes very elaborately carved.

POPULATION, as a study, comprehends those general laws that govern the increase or decrease of the human race, and the checks which modify them. The practical object of the investigation is to regulate the operation of the laws so as to promote the welfare of society. Malthus was the first to formulate the great law of the dependence of the increase of population on the means of its subsistence (see **MALTHUS**). The varying rate of increase in different countries makes it a subject which requires to be investigated under different heads. For those laws affecting it through the relations of births, deaths, and marriages, see **VITAL STATISTICS**.

PORCELAIN. See **POTTERY**.

PORCELAIN, **RÉAUMUR'S**. An opaque substance, so called after its discoverer, René Antoine Ferchault de Réaumur. It is sometimes obtained during the process of vitrification in enamel-painting. A moderate heat, long continued, produces devitrification—that is, the elements of the flux separate, and combine again in a different manner, resulting in the production of this material.

PORCH, a building forming an inclosure or protection for a doorway. Every one knows how much this beautiful feature is now used, and how efficient it is as a protection from the wind and weather. In Elizabethan and mediæval architecture, the porch was also very common in domestic architecture. In churches, it was almost universal in this country. In France many splendid porches or portals remain; they are amongst the most beautiful specimens of mediæval art. In England wooden porches, of picturesque structure, are very common in the parish churches of the middle ages.

PORCUPINE, *Hystrix*, a genus of mammalia, of the order *rodentia*, and family *hystrioidæ*. This family is remarkably characterized by an armature of spines, which, like those of the hedgehogs, are, as to their structure, merely thick and strong hairs. The *hystrioidæ* are plantigrade; the fore-feet have 4 toes and a rudimentary thumb, the hind-feet have 5 toes. Their general aspect is heavy and pig-like, and they have a grunting voice. The muzzle is broad and blunt; the ears short and rounded; the incisors smooth and large, 2 above, and 2 below; the molars 8 above, and 8 below. The name porcupine is derived from the French words *porc*, a hog, and *épin*, a spine.—The **Coat-**

MON PORCUPINE (*H. cristata*) is a native of the s. of Europe, of many parts of Asia, and of most parts of Africa. It is one of the largest of rodents, being from 2 to 3 ft. in length, besides the tail, which is about 6 in. long. The hinder part of the head and the neck are furnished with a crest of long bristles, capable of being elevated or depressed at pleasure. The muzzle and limbs are covered with very short hair; the back and sides with spines, which are longest on the middle of the back, where they are almost of the thickness of a goose-quill, and more than a foot long. The spines are supported by a slender pedicle, and they terminate in a sharp point; they are longitudinally striated, and are ringed with black and white, which gives a general gray color to the animal. Their ordinary position is flat, with the points directed backward; but when the animal is excited they are erected, and it rolls itself up like a hedgehog, with spines pointing in every direction. The tail spines or quills are of very singular structure, being open thin-sided tubes, about 2 in. long, supported upon slender flexible pedicles, and they make a sound by rattling together when the tail is shaken. The porcupine is said to rattle also the spines of its body when irritated, but this is doubtful. The statement has been often made, that it throws off its spines or quills by a voluntary act, launching them at its adversaries; but it has no such power, although it is possible that quills ready to come off may be detached in moments of excitement, and fly to a small distance with sufficient force to be annoying to a pursuer. The porcupine's armor, however, is strictly defensive, and it seeks to turn its back, and thus the points of its spines to an enemy. It is a solitary and nocturnal animal. It burrows in the ground, and in winter it becomes torpid. It feeds on roots, bark, fruits, and other vegetable substances, sometimes committing great depredations in gardens. The spines or quills of the porcupine are used for various purposes, and have a certain commercial value. It is chiefly sought on account of them; although its flesh is eaten, and was brought to the market of ancient Rome.—A larger species of porcupine (*H. leucurus*), with the quills of the tail quite white, is found in India, and other species inhabit different parts of the east. The **ATHERURE**, or **TUFTED-TAILED PORCUPINE** (*atherura fasciculata*), a native of India and Malacca, differs from the true porcupines in the head and muzzle not being convex, in having the quills flattened like blades of grass, and those of the tail gathered into a tuft at the end of it. The Canada porcupine, or urson (q.v.), is still more different from the true porcupines; and the coendus (*syntheres*) of the warm parts of America—which are covered with short quills, and, like the urson, live among the branches of trees—are remarkably distinguished by their long prehensile tail.

PORCUPINE ANT-EATER. See **ECHIDNA**, *ante*.

PORDENONE, a t. of Venetia, Italy, in the province of Udine, 40 m. n.n.e. of Venice, on the Noncello, a branch of the Livenza. The town is situated in a pleasant plain, near the base of the Alps. It is a station on the railway between Venice and Trieste. The site is supposed to be that of the *Portus Naonis* of the Romans. There are several large paper-mills, also cotton and linen manufactures, oil-mills, manufactures of copper goods, and glass-works. Pop. '71, 4,591.

PORGY, a species of acanthopterous fishes belonging to the genus *pagrus* and the family *sparidae*, of which the sheep's-head (q.v.) is a member. The porgy, or *pagrus argyrops* of Cuvier, is peculiar to the Atlantic coast of the United States. This is its name in the vicinity of New York, but in the vicinity of Rhode Island it is called scup, and scuppaug, and formerly bream. In Virginia it is called fair maid. It is usually from 10 to 14 in. long, but sometimes attains a length of 18 in., weighing 4 lbs. or more. It feeds upon worms, mollusks, small crustaceans, etc. It takes the hook quite greedily, particularly if baited with clams. It is abundant in some localities, but these vary with the season. It is often very cheap in the markets, although it is an excellent fish, nearly equal to the sheep's-head.

PORIFERA (Lat. *pore-bearing*) is the term employed by Dr. Grant to designate the class *spongiæ* or *sponges*, in consequence of the appearance which the members of this class present when a section is made through their tissue. The term *spongiæ* is used in preference by many naturalists.

PORISM, a kind of geometric proposition in high favor among ancient Greek mathematicians, but of which the notices that have come down to us are so few and meager that, till lately, mathematicians were not agreed about what a porism really was. The ancient works in which porisms are mentioned are the *Collections Mathematicæ* of Pappus, and the *Commentarii* of Proclus. Dr. Robert Simson (q.v.) was the first to restore the probably original form of porisms. As defined by Playfair, "a porism is a proposition affirming the possibility of finding such conditions as will render a certain problem indeterminate, or capable of innumerable solutions." Good examples of porisms are given in Simson's *Opera Reliqua*; Playfair's "Origin and Investigation of Porisms" (*Trans. of Roy. Soc. of Edin.* vol. iii.): Wallace's paper, "Some Geometrical Porisms, etc." (*Edin. Trans.* vol. iii. etc.).

PORK (Fr. *pore*, a hog, from Lat. *porcus*). The flesh of swine forms a very large portion of the animal food of most nations, although it is not the most nutritive, as will be seen by the following comparison of the four principal kinds of flesh-food:

	Mineral Matter.	Gelatine.	Fibrine and Alumen.	Fat.	Water.
Veal	4.5	7.5	9.0	16.5	62.5
Beef	5.0	7.0	8.0	30.0	50.0
Mutton.....	3.5	7.0	5.5	40.0	44.0
Pork.....	1.5	5.5	4.5	50.0	38.0

It has qualities, however, which especially fit it for man's use; its fatness makes it a very heat-giving food for cold and temperate climates; whilst it surpasses all other kinds of animal food in the ease with which it may be preserved by salting and drying. Hence the trade in pork is considerable in all countries where it is used, but especially so in Great Britain and America, where vast quantities are cured for the supply of ships and the army, and for home use. The quantity of pork imported into Britain (of which the greater part comes from the United States) is prodigious; in 1875 the value of the bacon and hams imported amounted to £6,955,200, besides pork to the value of £594,386. Millions of hogs are raised in the state of Ohio, and the curing of swine's flesh is the staple business of Cincinnati and other towns. A more vivid idea of the extent of this vast trade cannot be given than a recent statement of the *Louisville Gazette*, that "there were between 5 and 6 acres of barreled pork piled up 3 tiers high, in open lots, and not less than 6 acres unpiled, which would cover 18 acres if closely laid in a single tier on the ground; besides all which, 6 acres of pens were filled with hogs waiting to be killed." America has long furnished the chief supply of mess and common pork not only for the British army, navy, and mercantile marine, but also for those of most European nations. Next to America, Ireland, and especially the neighborhood of Cork, furnishes the largest supply of cured pork; and London and Wiltshire, and other parts of England, also furnish vast quantities of bacon and hams for general consumption.

POROSITY. By this term we express the experimental fact that no kind of matter completely fills the space it occupies; in other words, that all bodies are full of minute cavities or interstices, such as are illustrated on a large scale by a sponge. On the atomic theory, it is obvious that this must be the case if the atoms of matter are spherical, or, indeed, if they have any form save one or two special ones, such as cubes or rhombic dodecahedrons. It is commonly asserted that all bodies must be porous, because they are compressible; but this is a great mistake, since we have no reason to believe that matter is not *per se* compressible, independently of the existence of interstices. The Florentine academicians, in their attempts to compress water, proved the porosity of silver by flattening a sphere of that metal, filled with water, and soldered. The water escaped through the pores of the silver, and stood in fine drops on its surface. The porosity of liquids is easily shown by mixing alcohol and water. The bulk of the mixture is considerably less than the sum of the bulks of the components, showing that these must in part have entered each other's pores. This property of matter is of great importance in natural phenomena, as it brings the molecular forces of capillarity into play—raising the sap in vegetables, allowing rain to sink into the ground, etc.

PORPHYRIUS, one of that series of ancient philosophers to whom is due the reformation of the Greek philosophy known as Neoplatonism, was probably b. at Batanea in Syria (the Bashan of Scripture) in the year 233 A.D. His original name was Malchus, the Greek form of the Syro-Phœnician *Melech*, or king. The name by which he is known in history, *Porphyrius*, "one clad in purple," is but a Greek epithet intended as a sort of paraphrase of his name. He is said by Socrates the historian, and by St. Augustine, to have been originally a Christian; but this seems improbable, although it is certain that in his youth he was a hearer of Origen, or at least held some intercourse with him at Caesarea in Palestine. What is more certain is that he passed at a later time to Athens, where he studied rhetoric under Longinus, the well-known author of the treatise *On the Sublime*. It was at Rome, however, whither he repaired soon after 260, that he entered upon what must be regarded as, historically considered, the career of his life. Here he became a scholar of the Neoplatonist Plotinus, with whom, as well as with another member of the same school, named Amelinus, Porphyrius entered into an animated controversy, but eventually adopted so fully the opinions of Plotinus that he became himself, if not the leader of the school, at least the most trusted of the disciples of its master. After 6 years' residence in Rome, he went to Sicily, where, if St. Jerome's account is to be relied on, he wrote his once celebrated treatise in 15 books against the Christians, now known only from the replies which it elicited, having been burned by order of the emperor Theodosius. From Sicily he went to Carthage, and afterward to Athens; but eventually, Plotinus having died soon after Porphyrius left Rome, he returned to that city, where he continued to teach, as it would seem, until his death, which was probably about 305 or 306. For a view of Porphyrius's position in the history of the Neoplatonic school see NEOPLATONISTS. Porphyrius was a very voluminous writer. Of his works the titles of more than 60 are still preserved, 43 of which are entirely lost. His *Life of Pythagoras*; his work *On Abstinence from Animal Food*; his *Commentary on Aristotle's Categories*, with the *Introduction*; and *On the Harmonies* of Ptolemy; and the book *Ad Marcellam*, addressed to his wife, are preserved entire. The

rest are known chiefly by fragments, nor has any complete edition of his works been published.

PORPHYRY (Gr. purple), a term originally confined to an Egyptian rock used in sculpture, and known now as Rosso antico. It is composed, according to Delesse, of a red feldspathic base, in which are disseminated rose-colored crystals of the feldspar called oligoclase, with some plates of blackish hornblende, and grains of oxidized iron ore. The term is not now, however, used to denote any particular rock, but is applied to any rock which, like the Rosso antico, has a homogeneous earthy or compact base, through which are scattered distinct crystals of one or more minerals of contemporary origin with the base. Thus gray volcanic trachyte often abounds in crystals of glassy feldspar, forming a trachytic porphyry; or crystals of feldspar, quartz, or calcareous spar, disseminated through a base of greenstone, form a greenstone porphyry. In the same way, there are pitchstone porphyry, basaltic porphyry, claystone porphyry, etc.

PORPOISE, or **PORPESSE**, *Phocena*, a genus of cetacea, of the family *delphinidae*, having a form similar to the dolphins, but the muzzle short, uniformly convex, and without a beak; a dorsal fin; the teeth very numerous, simple, and equal. The COMMON PORPOISE (*P. communis*) is the most plentiful of the cetacea on the British coasts, abounding particularly on the western coasts of Ireland and of Scotland. It is found also on all the coasts of Europe from the Mediterranean northward, on the coasts of North America, and in the Arctic regions. It is one of the smallest of the cetacea, its length sometimes not exceeding 4 ft., although individuals occur of 6 or even 8 ft. in length. The body is spindle-shaped; its greatest diameter is near the dorsal fin. The skin is perfectly smooth and destitute of hair. There are from 40 to 50 teeth in each jaw, not conical, as in most of the cetacea, but compressed. The eye is rather small, and the pupil in the form of a V. The opening of the ear is very minute, like a hole made with a pin. The blow-hole is crescent-shaped, with the horns of the crescent directed forward, and is situated exactly over the eyes.

The porpoise is gregarious, and large numbers are often seen together, sometimes swimming in file, when their backs, appearing above the surface of the water, are apt to suggest the idea of a great sea-serpent; sometimes gamboling, either in fine weather or when a storm is approaching, or even in the midst of a storm. The porpoise feeds on fish, which its teeth are admirably adapted to catch; and herds of porpoises pursue the vast shoals of herring, mackerel, etc., into bays and estuaries. The porpoise sometimes ascends rivers, apparently in pursuit of salmon, as far as the water is brackish, and is not unfrequently itself caught on such occasions. It is an object of pursuit on account of its skin, its oil, and its flesh. The skin is nearly an inch thick, but is planed down until it becomes translucent, and is made into excellent leather, which is used for covering carriages and for other purposes. Little use is made of it in Britain, but it is used in America. Under the skin is a layer of fat, about an inch in depth, which yields oil of the finest quality. The flesh is dark-colored and bloody, but was in former times highly esteemed, and reckoned fit for the table of royalty, perhaps partly because among Roman Catholics it was accounted *fish*. In the time of queen Elizabeth it was still used by the nobles of England, and was served up with bread-crumbs and vinegar. It is now used only in very northern regions. It is a chief dainty of the Greenlanders.—The grampus (q. v.) is commonly referred to this genus.—Another species of porpoise (*P. capensis*) is found near the cape of Good Hope.—The name porpoise is from the French *porc-poisson*, or the Italian *porco-pesce* (hog-fish, corresponding to the French *marsouin* (sea-hog), and the German *meerschwein*.

PORPORA, **NICOLO**, 1686-1767; b. Naples; studied music under Searlatti. His musical talent was first recognized in Vienna, where he received the notice and approbation of the emperor Charles VI. He was very successful in Venice in 1726, and a year later became director of the theater in Dresden. He established a vocal school in Naples in 1731, and Farinelli and Cusarelli were among his pupils. In 1733 he went to London to conduct an opera, as a rival of Handel, where, although well supported, he was not considered successful. In 1746 he was in Vienna, and was Hady's teacher at that time; and in 1750 he was director of the Incrabilia conservatory in Venice. He composed a number of operas, masses, cantatas, and sonatas, which are little known now. He died poor in Naples.

PORRIGO. See **FAVUS** and **RINGWORM**.

PORSENNA, also **PORSENA**, **LARS** or **LARTH** (*Lar*, in Etruscan, means "lord" or "prince"), in the early and uncertain history of Rome, appears as a powerful king of Clusium in Etruria. According to the legend told by Livy for history, when Tarquin the proud was expelled from Rome, he sought the help, first of the Veii and the Tarquinii (his Etruscan kinsmen), against his revolted subjects; but their efforts not proving successful, he turned to Porsenna, who willingly espoused his cause, and marched a great army against Rome. The Etruscan king seized the Janiculum, a fortified hill on the w. side of the Tiber; and would have forced his way into the city across the "Bridge of Wooden Piles" (*pons sublicius*), had not a brave Roman, Horatius Cocles, kept the whole of Porsenna's army at bay, while his comrades behind him hewed down the bridge; after which he plunged into the Tiber, and safely swam across its waves. Porsenna, we

are informed, now laid siege to Rome; and after a while, the inhabitants began to suffer so severely from famine, that a desperate expedient was had recourse to. Three hundred of the noblest Roman youths swore to peril their lives in cutting off the Etruscan king. The first on whom the lot fell was C. Mucius, who stole into the camp of Porsenna, but not knowing the person of the king, killed his secretary instead. He was instantly seized, and put to the torture; but the unshrinking audacity with which he thrust his right hand into the fire and let it burn, moved the king so much, that he pardoned him; whereupon Mucius (ever afterward called *Scævola*, "the left-handed") told him of the jeopardy in which he was placed. Porsenna resolved to make peace with Rome at once, and his conditions, which were pretty favorable, being accepted by the sorely-pressed citizens, he withdrew his forces. This version of the story is wholly discredited by modern criticism, and is believed to have been invented by the patriotic annalists of ancient Rome to conceal the fact of a temporary Etruscan conquest, and the evidence in favor of this view is overwhelming. Tacitus even expressly affirms that Porsenna conquered the city; Dionysius informs us that the senate sent him an ivory scepter, a golden crown, and a triumphal robe, which was the form that had been adopted by the Etruscan cities themselves of acknowledging the supremacy of the Roman king, Tarquinius Priscus; and Pliny mentions a circumstance which is quite conclusive as a proof of the subjugation of Rome—viz., that Porsenna forbade the citizens to use iron, except for agricultural purposes. Niebuhr, who has placed this view beyond all doubt, notices various minor incidents which are perfectly unintelligible, except on the hypothesis of an Etruscan conquest. The whole details of the ancient legend, therefore, may be regarded as fabulous—the product of patriotic unverity—and what seems most reasonable to believe, is, that a great rising of the Etruscan against the Latin races took place, and that Rome, forming the Latin frontier toward Etruria, was exposed to the first brunt of the war, and suffered a disastrous defeat; but that shortly after, the Etruscans themselves were decisively beaten, and forced back into their own territories; for after the conquest of Rome, Aruns, a son of Porsenna, proceeded against Aricia, where (according to Livy) his army was routed under the walls of that city by the combined forces of the Latin cities, with the help of Greek auxiliaries from Cumæ. It is worth while quoting, as a proof of Niebuhr's wonderful talent for felicitous conjecture, that he explains the long surviving Roman custom of beginning an auction by offering for sale the goods of king Porsenna, by the supposition that in the recovery of their independence, the Romans probably captured property belonging to their late master, which they may have publicly sold. The sepulcher of Porsenna at Clusium is described by Varro, but his description is not credible. The ancient legend has been magnificently rendered in modern verse by Macaulay. See the *Lays of Ancient Rome*.

PORSON, RICHARD, the greatest Greek scholar England has ever produced, was b. on Christmas, 1759, at East Ruston, Norfolk, where his father was parish clerk. The curate of the parish conceiving a liking for the boy, on account of his omnivorous appetite for books and his marvelous memory, took charge of him, and had him educated along with his own sons. Porson afterward found a patron in Mr. Norris (the founder of the Norrisian professorship at Cambridge), who sent him to Eton in 1774, where he remained four years, but did not acquire any of the ordinary distinctions, although it is evident that it was there his mind acquired a fixed bias toward classical studies. Another patron, sir George Baker, sent him, in 1778, to Trinity college, Cambridge, of which he was elected a scholar in 1780. Next year he won the Craven scholarship, and subsequently, the first chancellor's medal. In 1782 he was chosen a fellow of Trinity. It was about this time that he began to give indications of his subtle sagacity and taste in the difficult verbal criticism of the Greek dramatists. For four years he contributed to *Maty's Review*—his first critique being on Schmlz's *Æschylus*, and his finest on Brunck's *Aristophanes*. He also opened a correspondence with professor Ruhnken. If, however, we are to judge from a quatrain written at a later period of his life, he did more than correspond:

I went to Strasburg, where I got drunk
With that most learned professor Brunck;
I went to Wortz, and got more drunken
With that more learned professor Ruhnken.

In 1787 appeared, in the *Gentleman's Magazine*, his sarcastic letters on Hawkins's *Life of Johnson*. For the same periodical he also wrote his far more famous and trenchant *Letters to Travis on the Three Witnesses*. The dispute concerned the genuineness of John 1. 7, 8, and was occasioned by a blundering and pretentious defense of the passage by archdeacon Travis, against the scornful attack of Gibbon. Porson naturally incurred great odium on account of the side he took in this controversy. One old lady who had him in her will for a legacy of £300, cut it down to £30, when she heard that he had written a book against Christianity. In 1792 he resigned his fellowship, as he found that he could not conscientiously take orders in the church. Some of his friends now raised a fund to preserve him from want, and about £100 a year was secured. He was also appointed to the regius professorship of Greek in the university of Cambridge—an office, indeed, only worth £40 a year; yet so splendid was his learning, so admirable his taste, so vigorous and epigrammatic his style of criticism, that he might easily have—by the exercise of a moderate degree of continuous literary labor—succeeded in gaining a handsome income.

But already "two devils had him in their gripe"—procrastination and a raging thirst for drink—and they held him firm to the end of his melancholy career. The only thing he ever did in connection with his Greek professorship was to deliver a *praelectio* so excellent, that, it has been said, if he had passed from verbal to æsthetic criticism he would have surpassed all his countrymen in that too. In 1794 he edited the plays of Æschylus for the Foulis press, Glasgow; and between 1797 and 1801, four of Euripides, the *Hecuba*, the *Orestes*, the *Phœnissæ*, and the *Medea*. He also collated the Harleian MS. of the *Odyssey* for the Grenville Homer. In 1806 he was appointed librarian of the "London institution" with a salary of £200; but was so grossly negligent of his duties that the directors officially notified their dissatisfaction in these emphatic words: "We only know that you are our librarian by seeing your name attached to the receipts for your salary." He died of apoplexy, Sept. 25, 1808, in the 49th year of his age, and was buried with great pomp in the chapel of Trinity college, Cambridge. Porson's rage for drink was fearful. He would pour anything down his throat rather than endure the "terrible torture of thirst." Ink, spirits of wine for the lamp, an embrocation, are among the horrible things he is reported to have swallowed in his extremity. "He used to return to the dining-room after the company had left it; pour into a tumbler the drops remaining in the wine glasses, and drink off the collectanea." In fact, his thirst was so outrageous, that Porson cannot be considered a mere willful drunkard; one must believe that he was driven into his excesses by some unknown disease of his constitution. See POLYDÆSIA. Porson's memory was as amazing as his thirst. The anecdotes told by his biographers almost surpass belief, yet are thoroughly authenticated. His critical acumen has never been matched in England. His tracts, reviews, letters, etc., were collected and edited, with a biographical notice, by Kidd, in six volumes. See "Porsoniana" in Rogers's *Table-Talk*, and the rev. J. Selby Watson's *Life of Richard Porson, M.A.* (1861).

PORT, in naval language, has at least three significations; first, a port is a harbor where ships are admitted to embark or discharge cargoes, or for other purposes—a free port being one in which the embarkation and discharge can be conducted without the payment of customs or port dues. A port in a ship's side is the aperture for admitting light and air, or for pointing a gun through. See PORT-HOLE. Port is also the official name for the left-hand side, when looking toward the bow of a ship—i.e., looking forward. The term was, a few years ago, arbitrarily substituted for larboard (q.v.).

PORTA, GIAMBATTISTA DELLA, 1540-1615; b. Naples; spent much time traveling in Spain, France, Italy, and other parts of Europe, assisting many schools and academies by his knowledge and wealth. An association of men called "I Segreti," met at his house, only those who had discovered some principle or fact in natural science being admitted as members. This society made certain predictions, which were fulfilled, and hence was accused of magic. The news of this reaching the pope, Porta was compelled to dissolve the society. He was sought by many because of his supposed secret power, and ability to read the future. He benefited the world by his investigations in optics, the camera obscura and several other instruments having been invented by him. Among his writings were dramas which were not successful, but he produced works on human physiognomy, magic, geometry, chemistry, meteorology, optics, and landscape gardening many of which were much sought. *De Humana Physiognomia*, his principal work, was published in Sorrento, 1586, followed two years later by his translation into Italian, published in Naples.

PORTADOWN (Ir. *Port-na-Doon*, Port of the Fort), a market and manufacturing t. of the co. of Armagh, Ulster, Ireland, on the Bann, 11 m. n.e. of Armagh by railway. It was formerly the seat of the M'Canns, a clan tributary to the O'Neil, and formed part of territory "settled" by James I. and afterward by Charles I. It is a place of considerable trade in corn, flax, and other agricultural produce, and is the seat of an extensive manufacture of linen yarns and linen. Communicating by canal with the sea at Newry, and by railway with Belfast, it has also a considerable import trade. The pop. in 1871 was 6,735, of whom 3,147 were Protestant Episcopalians, 1932 Roman Catholics, 857 Presbyterians, 715 Methodists, and the rest Protestants of other denominations. Portadown is connected by the Ulster railway with Armagh, Dungannon, and with the several n.w. counties.

PORTAELS, JEAN FRANÇOIS, b. Belgium, 1820; studied painting in the academy of Brussels, and in Paris under Paul Delaroché, and then spent ten years traveling in Italy, Egypt, and the east. In 1847 he was appointed director of the academy of Ghent, and in 1851 was knighted. Among his best-known works are "The Story-teller of Cairo," "A Funeral in the Desert of Suez," "A Caravan in Syria Overtaken by a Simoon," "Fatima," "Rebecca," "Ruth," "The Suicide of Judas," and a portrait of Mehemet Ali, his patron. At an exhibition of paintings in Sydenham palace in 1873, he received a special gold medal for the finest picture, "A Drought in Egypt."

PORTAGE, a co. in n.e. Ohio; drained by the Cuyahoga and Mahoning rivers; intersected by the Cleveland and Pittsburg, and Atlantic and Great Western railroads; 500 sq. m.; pop. '80, 27,500—24,794 of American birth. The surface is level, and the soil produces in large quantities corn, flax, oats, and hay. Butter, cheese, and maple sugar are made. Bituminous coal is found. Co. seat, Ravenna.

PORTAGE, a co. in w. c. Wis., intersected by the Green Bay and Minnesota, and the Wisconsin Central railroads, and drained by the Wisconsin, Plover, and Waupaca rivers, and Mill creek; 792 sq. m.; pop. '80, 17,731. The surface is hilly and largely covered with pine trees; the soil is fertile; cattle, grain, wool, and hops are the principal products. It contains 22 saw-mills, and lumbering is extensively carried on. Co. seat, Stevens Point.

PORTAGE, a city and seat of justice of Columbia co., Wis., on the Wisconsin river at the head of navigation, and on a canal which connects the Wisconsin and Fox rivers, and renders the waters navigable from Green bay into the Mississippi. It is on the Wisconsin Central, and the Milwaukee and St. Paul railroads, 32 m. n. of Madison; pop. '80, 4,446. It has water-power from the canal, and has boot and shoe factories, flour-mills, tanneries, breweries, and the machine and repair shops of the railroads. It contains a court-house, jail, schools, and banks, and has a large trade from the surrounding country.

PORTAL, the recess of a large doorway, such as the entrance to a church. See **Porch**.

PORTALIS, JEAN ÉTIENNE MARIE, 1746-1807; b. in Beausset, Provence, France. At the age of 21 he was admitted as an advocate by the parliament of Aix. He became widely known by his memorial *On the Validity of Protestant Marriages in France*, and by his prosecution of the cases against Mirabeau and Beaumarchais. At the outbreak of the revolution he fled to Lyons; but in 1793 went to Paris, where he was imprisoned, obtaining his liberty after the fall of Robespierre. In 1795 he was a member of the council of the ancients, where he advocated humane measures in opposition to the directory. In 1797 he was proscribed, and fled to Germany, but in 1800 returned. In 1801 he became counselor of state, in 1803 a senator, and in 1804 minister of the interior and public worship. He was the author of *Traité sur l'Usage et l'Abus de l'Esprit Philosophique pendant le xviii. Siècle*. He was a member of the French academy.

PORTAMENTO (Ital. *portare*, to carry), a musical term used for the sustaining of the voice, and passing from one note to another.

PORTARLINGTON, a market t. and parliamentary borough, partly in the King's county, partly in the Queen's county, Leinster, Ireland, on the Barrow, 44 m. w. s. w. from Dublin, with which it communicates by the Great Southern and Western railway. Pop. in '71, 2,424, of whom 1688 were Roman Catholics, 673 Protestant Episcopalians, and 58 Methodists. Portarlington was anciently called Cooltoodra; but being granted by Charles II. to the earl of Arlington, was called by his name. By him it was sold to sir Patrick Traul; and on the attainder of sir Patrick, was granted by William III. to gen. de Rouvigny, who planted in it a colony of French and Flemish Protestants, many of whose descendants still remain. It is now the property of the family of Dawson, earls of Portarlington. It returns one member to parliament. The town is well built, and provided with two national, two endowed, and also private schools of considerable reputation, at one of which the late duke of Wellington and his brother lord Wellesley received part of their education. The ratable value of property is £4,339.

PORT ARMS, in musketry drill, is derived from *portare*, to carry, and applies to a motion in which the fire-arm is brought to a slanting position in front of the body, lock to the front, the barrel crossing opposite the front of the left shoulder.

PORT-AU-PRINCE, or **PORT-REPUBLICAN**, the capital of Hayti (q. v.), is situated on the w. coast, at the head of a bay of the same name, and has a fine appearance from the sea, but the interior is filthy in the extreme. The houses are chiefly of wood, and dung-steads obtrude everywhere, even in the thoroughfares. The most notable buildings are the palace and the senate-house; other public edifices are the churches, a lyceum, college, custom-house, mint, and hospital. Port-au-Prince carries on a trade in mahogany, log-wood, honey, coffee, cocoa, and rags. Pop. about 21,000. The town has suffered frequently from earthquakes.

PORT CHESTER, a v. in Westchester co., N. Y.; 25 m. from N. Y. city; on the New York, New Haven and Hartford railroad; pop. '70, 3,797. The place was incorporated in 1868. It is pleasantly situated, and the residence of many business men of the city. There is a weekly paper, two banks, an iron foundry, and several factories and mills. There is navigation to its wharves, for small vessels, on Byram river emptying into the sound.

PORTCULLIS (Fr. *porte*, gate, and *coulisse*, from *couler*, to flow), a frame of wood strengthened with iron in the form of a grating, and sliding in vertical grooves in the jambs of the entrance gate of a fortified place, in order to defend the gate in case of assault. The vertical bars were pointed with iron below, and struck on the ground when the grating was dropped, so as to injure whatever it fell upon. In heraldry, the portcullis is represented with rings at its uppermost angles, from which chains depend on either side. It was a badge of the Beaufort family, and borne in virtue of their Beaufort descent by the Tudor sovereigns. Portcullis is the title of a pursuivant in the English college of arms, whose office was instituted by Henry VII.

PORT D'URBAN, or **PORT NATAL**, the only sea-port of the colony of Natal (q. v.).

PORTE, sublime porte, or ottoman porte, the name given to the Turkish government. The origin of this name is to be referred to the ancient oriental custom of making the

gates of cities and of king's palaces places of assembly in connection with the affairs of government and of the administration of justice. In the Byzantine empire this custom was adopted, and the term was transferred from the high gate of the imperial palace to the government whose authority was there exercised. The Turks found the term in common use among the Byzantines some time previous to their establishment at Constantinople, and adopted it on the organization of their empire. The use, among European nations, of the French term *sublime porte* ("lofty gate") is accounted for by the fact that French is the language of European diplomacy.

PORT ELIZABETH, an important sea-port of s. Africa, commercial capital of the eastern province of the British colony of the cape of Good Hope, stands on the western shore of Algoa bay (q.v.), in lat. about 34° s., long. 25° 35' east. Many of the streets are elegant. One range of houses, consisting of four streets, which will bear comparison with the best streets in England, forms a continuous line 2 m. in length. In the style of its buildings, this town is superior to any other in s. Africa. Its magnificent warehouses are constructed on a palatial scale, and resemble the finest in London, and its public buildings are all solid and substantial edifices. The principal are the town-house, 90 ft. square and three stories high, containing the public library, the Athenæum, and the municipal chambers; the public hospital, furnished with 100 beds; the Presbyterian and other churches, and the Roman Catholic cathedral. Its educational institutions are of a superior description. In 1854, under the auspices of governor sir George Grey, a system of schools was introduced known as the Grey institute schools, founded on a magnificent grant of town-lands, lately yielding a revenue of over £1000 per annum, and which affords a very excellent education at a very moderate charge. The chief of these are a high-school or college, and three elementary or district training-school.

The town was founded in 1820, and the census of 1865 showed the population of the municipality of Port Elizabeth to be 8,700; in 1875 it was close on 13,000. Port Elizabeth has made more rapid advancement than any other town in the colony; and the inhabitants are particularly notable for their enterprise and business energy. It owes its commercial importance in great part to the circumstance of its being the emporium of the great wool trade of the colony; and besides this it carries on a rapidly-increasing home and foreign trade. The transactions of its four banks are extensive. Two lines of railway run inland from Port Elizabeth. The imports are valued at near £1,500,000 a year, and the exports about £2,000,000. As much as thirty or forty millions of pounds of wool may be exported in one year. The other colonial exports fall mainly under the heads of skins, hides, horns, ivory, and feathers.

The shore is open to the swell of the Indian ocean, which often rolls in upon the beach with such violence that, until recently, cargoes could only be got to land by the use of surf-boats. Kaffirs, tempted by the high pay offered, used to come from a great distance to do the difficult and dangerous work of unloading the boats. But this system of landing is now in great measure done away with, and ships now unload at several jetties. A break-water has been constructed, and there are three lights for the direction of vessels.

PORTER, a kind of malt liquor which came into use in London in 1722. According to Leigh, "the malt liquors previously in use were ale, beer, and twopenny, and it was customary to call for a pint or tankard of half-and-half—i.e., half of ale and half of beer, half of ale and half of twopenny, or half of beer and half of twopenny. In the course of time it also became the practice to ask for a pint or tankard of three-thirds [or, as it became corrupted, *three threads*], meaning a third each of ale, beer, and twopenny; and thus the publican was obliged to go to three casks for a single pint of liquor. To avoid this trouble and waste, a brewer of the name of Harwood conceived the idea of making a liquor which should partake of the united flavors of ale, beer, and twopenny. He did so, and succeeded, calling it entire, or entire butt beer, meaning that it was drawn entirely from one cask or butt; and being a hearty nourishing liquor, it was very suitable for porters and other working people. Hence it obtained the name of porter, and was first retailed at the Blue Last, Curtain Road, Shoreditch." The chief characteristics of porter are its dark-brown color, peculiar bitter flavor, and agreeable freshness in drinking. Until within the last twenty years it was generally brewed with malt roasted until slightly brown; now, however, under the improved system of brewing, pale malt, with the addition of some highly roasted, for the sake of color only, is used. Enormous quantities are brewed by the London brewers. A kind much stronger than ordinary porter is also extensively brewed in London, Dublin, and elsewhere, under the name of *stout*. The name porter is now seldom used in England, beer being the general designation.

PORTER, a co. in n.w. Indiana, bounded by lake Michigan on the n., and drained by the Calumet and Kankakee rivers, the latter its s. limit; intersected by the Baltimore and Ohio, the Fort Wayne and Chicago, the Chicago and Lake Huron, and the Lake Shore and Michigan railroads; 420 sq.m.; pop. '80, 17,229—13,353 of American birth. The surface is a rolling prairie and produces corn, hay, wheat, and oats. Co. seat, Valparaiso.

PORTER, ANDREW, 1743—1813; b. Penn.; before the revolution was a school-teacher, but in 1776 was made a capt. of marines and served on the *Eppingham*. He-

afterward joined the artillery, was noted as a scientific gunner, and was engaged in the battles of Trenton, Princeton, Brandywine, and Germantown, receiving the personal commendation of Washington on the field of battle. He was made maj. in 1782 and later col. In 1779 he was with Sullivan's expedition against the Indians; subsequently held high offices in the state militia, but declined to accept the rank of brig.gen. and office of secretary of war, tendered him by president Madison at the outbreak of the war of 1812.

PORTER, DAVID, 1780-1843; b. Boston; entered the navy as midshipman in 1798, served on board the *Constellation* in the fight with the *Insurgente* in 1799, and was made a lieut. for his gallant conduct. He held two or three commands in the Tripoli troubles; was twice wounded, and in 1803 made prisoner and detained for 18 months. In 1806, while in command of the *Enterprise*, he defeated 12 Spanish gunboats which attacked him near Gibraltar. At the beginning of the war of 1812 he was made a capt. and assigned to the *Essex*, a frigate of 32 guns. He took the *Alert*, the first ship-of-war captured in the war; the *Nocton*, having a large amount of gold on board; and many trading vessels. In 1814, while lying in Valparaiso, a neutral port, the *Essex* was attacked by two frigates, the *Phoebe* and *Cherub*, carrying in all 64 guns, and defeated, after a heroic resistance, with a loss of 58 killed, 66 wounded, and 31 missing. In 1815 he was one of the navy commissioners and held the office until 1823, when he was sent to the gulf of Mexico to suppress piracy. Indignant at insults to the American flag at Porto Rico, he demanded an apology and by threats of force obtained one from the authorities. For this he was recalled, court-martialed, and sentenced to suspension for 6 months. In 1826 he resigned, and for a short time was connected with the Mexican navy, but in 1829 became U. S. consul at Algiers. From 1831 to 1843 he held diplomatic positions at Constantinople, and negotiated treaties of importance. He wrote *Constantinople and its Environs* (1835).

PORTER, DAVID D., Admiral of the American navy, son of commodore David Porter, who commanded the *Essex* frigate in the war of 1812, b. Philadelphia about 1805, entered the navy as midshipman in 1829, serving under commodores Biddle and Patterson, passed his examination in 1835, was employed from 1836 to 1841 in the survey of the coast of the United States; in 1841 appointed as lieut. to the frigate *Congress*, and employed 4 years on the Mediterranean and Brazil stations; in 1845 transferred to the national observatory at Washington, and during the Mexican war, to the naval rendezvous at New Orleans; again to the coast-survey, and from 1849 to 1853 engaged in command of the California mail-steamers. At the commencement of the war of 1861 he was appointed, with the rank of commander, to the steam sloop-of-war *Powhatan*, and ordered to Pensacola; distinguished himself in the capture of New Orleans, and commanded the gunboat and mortar flotilla which co-operated with the squadron of admiral Farragut in the first attack upon Vicksburg. In 1863 he aided in the second and successful bombardment, and subsequently commanded the naval forces in James river, and in the attacks upon fort Fisher, captured at the second attack. At the termination of the war, he was appointed superintendent and president *ex officio* of the U. S. naval academy, Annapolis. He was made vice-admiral in 1866, and in 1870 he became admiral, a rank which carries with it the command of the whole U. S. navy, subject only to the president.

PORTER, EBENEZER, D.D., 1772-1834; b. Conn.; graduated at Dartmouth college in 1792; studied theology at Bethlehem, Conn.; became in 1796 pastor of the Congregational church at Washington, Conn.; in 1812 professor of sacred rhetoric in Andover theological seminary, and in 1827 its president, retaining the positions until his death. He published *Young Preacher's Manual*; *Analysis of Vocal Inflections*; *Analysis of the Principles of Rhetorical Delivery*; *Rhetorical Reader and Exercises*; *Lectures on Homiletics and Preaching*, and on *Public Prayer, with Sermons and Addresses*; since his death *The Biblical Reader* and *Lectures on Eloquence and Style* have been published. Dr. Porter was a contributor to the *Quarterly Register*, and a translator of many sacred German poems.

PORTER, FRZ JOHN, b. N. H., 1822; graduated at the U. S. military academy, West Point, 1845, when he entered the army as brevet second lieut. of artillery. He was engaged in the war with Mexico from the beginning; was wounded in the attack on the city of Mexico, Sept. 13, 1847; and was promoted to brevet capt. and maj. for distinguished gallantry in the battle of Molino del Rey and the storming of Chapultepec. After the war he was sent to West Point, where he was adj. of the post, and acted as instructor of artillery and cavalry. In 1856 he was transferred to the adj.gen.'s department, and was assistant adj.gen. of the Utah expedition under Albert Sidney Johnston in 1857. On May 14, 1861, he received the appointment of col. of the 15th infantry; was made brig.gen. of volunteers on the 17th; and served as chief of staff with gen. Banks and gen. Patterson, until August, when he was put in command of a division in the army of the Potomac. He had charge of the siege operations against Yorktown during the campaign on the peninsula, and was then given the command of the 5th army corps, which fought the battles of Mechanicsville and Gaines's Mill, and bore the brunt of the fight at Malvern hill. During a part of the second battle of Bull Run this corps was heavily engaged, and was badly cut up; it was also in the fight at

Antietam. In Nov., 1862, gen. Porter was tried by court-martial for alleged disobedience of the orders of gen. John Pope, at Manassas, on Aug. 28-29, 1862; and on Aug. 21, 1863, was cashiered and di-qualified from holding any position under the U. S. government. In June, 1878, a board of officers was convened at West Point, by order of the president of the United States, to examine the evidence and to consider the findings of the court-martial in the case of gen. Porter, and to report to the secretary of war what action, in their judgment, justice required should be taken by the president in reference to that case. This board, after a full examination of the case, including evidence before inaccessible, and other evidence before misunderstood, reported that, in the opinion of those forming it, justice required at the hands of the president of the United States "such action as may be necessary to annul and set aside the findings and sentence of the court-martial in the case of maj.gen. Fitz John Porter, and to restore him to the position of which that sentence deprived him—such restoration to take effect from the date of his dismissal from office." This report was signed by the entire board, including maj.gen. J. M. Schofield, brig.gen. Alfred H. Terry, and brevet maj.gen. Geo. W. Setty. The report was laid before the house committee on military affairs, and a majority of this committee, in Jan., 1881, reported a bill restoring him to his rank of maj.gen. in the U. S. army; and requiring the secretary of the treasury to pay to gen. Porter the sum of \$75,000, "as a measure of award in acknowledgment of the wrong done to and suffered by him through his dismissal from the army and deprivation from the rights of citizenship, upon charges now established to be unfounded." At the present time (April, 1881) congress has not completed its action in regard to this case.

PORTER, HORACE, b. Penn., 1837; educated at West Point, and appointed to the ordnance department of the army in 1860. He was assistant ordnance officer on the Port Royal expedition in 1861, participated in the siege of fort Pulaski, Georgia, and the James island expedition. He was chief of ordnance of the army of the Potomac, 1862, and of the army of the Cumberland, 1863, and aid-de-camp to gen. Grant, 1864-65. He was military sec. to gen. Grant, 1869-73.

PORTER, JANE, 1776-1850; b. England; educated at Edinburgh; lived with her mother and sister till their death. Her first work, *Thaddeus of Warsaw*, appeared in 1803, was extremely popular, and secured her a complimentary letter from Kosciusko, and election into the Teutonic order of St. Joachim as canoness. In 1809 she published *Scottish Chiefs*, a romance of the times of Bruce and Wallace. Like her former work, it contains some vigorous description, but shows little knowledge of the period of which it treats. She composed, in association with her sister Anna Maria, *Tales round a Winter's Hearth*, 1826, which was followed by *The Field of Forty Footsteps*, which was dramatized. Her last work, *Sir Edward Seward's Diary*, 1831, so closely imitated the style of the period to which it relates, as to make it doubtful, owing to its anonymous publication, whether it was a novel. Her younger sister, ANNA MARIA, (1781-1832,) wrote many novels, in which the heroes and heroines are always endowed with a monotonous super-excellence of virtue.

PORTER, JOSHUA, 1730-1825; b. Conn., educated at Yale college, and became a physician. He was a member of the state legislature; colonel in the state militia, and commanded a regiment at the battle of Saratoga.

PORTER, MOSES, 1755-1822; b. Mass.; lieut. in the artillery in 1775, and served through the revolutionary war, and the war of 1812. He was at White Plains, Trenton, Brandywine, and Germantown. He was made capt. in 1791, was attached to Wayne's command in 1794, and col. in the light artillery in 1812. He commanded the artillery in the army under Wilkinson, was prominent at the capture of fort George in May, 1813, and was brevetted brig.gen. in the same year.

PORTER, NOAH, D.D., LL.D., b. Conn., 1811; graduated at Yale college, 1831; taught school at New Haven, 1831-33; was a tutor at Yale, 1833-35, during which time he studied theology; became pastor of a Congregational church in New Milford, Conn., 1836; was pastor at Springfield, Mass., 1843-46, was elected professor of metaphysics and moral philosophy at Yale, 1846; and in 1871, on the retirement of president Woolsey, was chosen president of the college; spent a year in Europe, 1853-54; was principal editor of the revision of Webster's *American Dictionary of the English Language*, published 1864; published an elaborate treatise on *The Human Intellect, with an Introduction upon Psychology and the Soul*, 1868; and an abridgment of it, 1871; is the author also of *The Educational Systems of the Puritans and Jesuits compared*—a prize essay; *Books and Reading; American Colleges and the American Public; The Sciences of Nature versus the Science of Man*, a review of the philosophical opinions of Herbert Spencer. He has written many important papers for leading magazines; and is recognized as a thinker of great breadth and exactness, and as a theologian is thoroughly evangelical and singularly free from theological prejudice.

PORTER, PETER BUEL, 1773-1844; b. Conn.; began the practice of law at Canandaigua, N. Y., 1795, and was member of congress 1809-13 and 1815-16. He was appointed maj.gen. of the New York and Pennsylvania volunteers in 1813, commanded at the defense of Black Rock, now Buffalo, in July of that year, and took part in the battles of Chippewa, Niagara Falls, and fort Erie. In 1815 he was offered but declined

the post of commander-in-chief of the army. He was one of the commissioners under the treaty of Ghent, secretary of state of New York, and secretary of war under the younger Adams.

PORTER, Sir ROBERT KER, 1780-1842; b. Durham, England; brother of Jane Porter; when but 10 years old became a student of the Royal art academy of London. Before he was of age he had painted several historical pieces of some pretensions. In 1804 he became court painter to the court of Russia, and in 1811 married the daughter of prince de Sherbatoff. He now became a soldier and traveler; was in Spain with sir John Moore in 1809; from 1826 to 1841 was British consul at Venezuela; and at the time of his death was visiting St. Petersburg. He published several volumes of travels.

PORTER, THOMAS, 1734-1833; b. Conn.; was with the British army at lake George in the French war of 1755, and afterward served in the Connecticut legislature. He was prominent in public affairs during the revolution; removed to Vermont in 1779, where he was for many years a member of the legislature, and judge of the county or superior court.

PORTER, WILLIAM DAVID, 1810-64; b. New Orleans; the son of commodore David Porter; entered the navy as midshipman in 1823, served in the Mexican war, was prominent in establishing the light-house system, and retired in 1855 with the rank of lieutenant. In 1859 he re-entered the service, and remained loyal, though his two sons joined the southern cause. In command of the *Essex*, he was prominent in the attack on forts Donelson and Henry, in the fight past the batteries on the Mississippi from Cairo to New Orleans, and in the assault on Vicksburg and Port Hudson. He disabled the confederate iron-clad *Arkansas*, which was blown up. For his many gallant services he was made a commodore in 1862, but owing to ill-health did little more active duty.

PORTEUS, BEILBY, D.D., 1731-1808; b. York, England; educated at Christ's college, Cambridge, where he obtained a fellowship, and gained the prize for a poem on death; became in 1762 chaplain to archbishop Secker, and to George III. in 1769; appointed bishop of Chichester in 1776, and of London in 1787. He published: *A Summary of the Evidences of Christianity*; *Review of the Life and Character of Archbishop Secker*. Bishop Porteous was a man of learning, of liberal and enlarged views, sound judgment, deep and unaffected piety, and surpassed by few as a preacher in eloquence or pathos.

PORT-FIRE is a sort of slow match for firing guns. It consists of a paper tube from 16 to 20 in. in length, filled with a composition thus proportioned: saltpeter 666 parts, sulphur 222 parts, mealed gunpowder 112 parts. The composition is rammed with force into the paper barrel, and then when ignited it burns for a considerable period. As a substitute may be employed soft brown paper dipped in a solution of 2 oz. of niter to a gallon of water, dried, and rolled up to the size of a common port-fire. Another port-fire consists of a rod cut square, of lime, birch, or poplar, boiled for six hours in a solution formed by dissolving 1 lb. of nitrate of lead in 1 quart of water. The rod is subsequently boiled in spirits of turpentine. When thoroughly dried one yard will burn three hours.

PORT GLASGOW, a parliamentary burgh and sea-port of the county of Renfrew. Scotland, is situated on the Clyde, about 2 m. e. of Greenock, and 20 m. n.w. of Glasgow. It was founded in 1668 by the magistrates of Glasgow as a harbor for the ships that belonged to or traded with their city—the Clyde at Glasgow being then inconveniently shallow, and the idea of deepening the river not having yet occurred. In 1695 the town and a small adjacent district were made into an independent parish; in 1710 it was constituted the principal custom-house on the Clyde, and for a while took the lead of Greenock; in 1775 it was incorporated as a municipality, and by the reform bill of 1832 it was raised to the rank of a parliamentary burgh, uniting with Kilmarnock, Rutherglen, Dumbarton, and Renfrew in electing a member of the legislature. Port Glasgow is rather a well-built town. The principal buildings are the town-house, custom-house, and churches of the different denominations. Port Glasgow has extensive manufactures of sail-ropes, chain-cables, several sugar-refineries, foundries, building-yards, commodious quays, and an extensive wet-dock. The deepening of the Clyde, enabling large vessels to ascend to Glasgow, seriously injured its commercial prosperity, but the trade has been for many years improving; the shipping employed is considerable. In 1876, 38 ships, of 17,066 tons, were registered at Port Glasgow; and in the same year 53 vessels, of 27,406 tons, were built here. Pop. '71, 9,851; parl. constituency (1877-78), 1158.

PORT HENRY, a village in n.e. New York, pleasantly situated on the s.w. shore of lake Champlain, 2 m. from Mount Bulwaga; pop. '70, about 1000. The surrounding country abounds in magnetic iron ore, which it exports. It is on the Hudson and Delaware railroad, 40 m. n. of Whitehall, and 35 m. s.w. of Burlington. It has a well-organized fire department, public schools, 2 newspapers, 4 churches, and several blast furnaces and blomerics for the manufacture of iron.

PORT-HOLES are embrasures or openings in the side of a ship of war to enable the guns to be ranged in battery. The port-holes are ordinarily square, of size sufficient to enable the guns to be pointed at a considerable angle. In stormy weather the ports are closed, the guns being run in. When the guns are run out and no fighting is anti-

pated, half-ports are employed to keep the water out. There is a row of ports for each gun-deck, and by these rows the rating of the vessel is described as three-decker, two-decker, etc. Within the port rings are fixed through which the ropes are passed for working the heavy guns.

PORT HOPE, a t. in Ontario, dominion of Canada, on the n. shore of lake Ontario; pop. '71, 5,114. It is the co. seat of Durham co., and the s. terminus of the Midland railway on the Grand Trunk. It is 63 m. from Toronto, in a beautiful valley, on the side of a hill from which a fine view of the lake is obtained. A daily line of steamers runs to Charlotte, N. Y., connecting with Rochester by rail. It has water-power, a fine harbor, and an active trade in lumber and grain. It is the seat of Trinity college, and has 2 newspapers, 6 churches, several hotels, and 3 branch banks. It has a large fleet of fishing vessels, and manufactories of woolen goods, buttons, leather, wooden ware, steam engines, machinery, iron castings, etc.

PORT HURON, a city in s.e. Michigan; incorporated 1857, at the head of the St. Clair river, in the county of St. Clair, and opposite Sarnia, Canada; pop. '74, 8,240. It is on the Grand Trunk railroad, at the terminus of the Chicago and Lake Huron; 53 m. n.e. of Detroit, 66 m. e. of Flint, and 110 m. e. of Lansing. Large quantities of lumber are carried down the Black river to this point, and the trade in lumber and shingles is important. It is near the foot of lake Huron, connected with Sarnia by steam ferry-boats, and by steamers with Detroit, and its domestic and foreign commerce is considerable. Two horse-railroads lead to fort Gratiot, 1½ m. distant, where the Grand Trunk railway crosses the St. Clair, and the ferry to port Sarnia connects it with the Great Western line. The Black river at this point is crossed by two bridges. It is supplied with water by the Holly system, and has flour and saw mills, grain elevators, ship-yards, dry-docks, three newspapers, and the repair shops of the railroads. It is lighted by gas, has an opera-house, a national bank, a savings bank, public schools, and a fine city hall. In 1877 a government building, for a custom-house and post-office, was erected, costing \$250,000.

PORTICI (formerly *Portico*), a town of southern Italy, is situated on the slope of Vesuvius, near Herculaneum, 4 m. s.e. from Naples, with 11,288 inhabitants. Its environs are delightful, and are dotted all over with country houses. There is a royal palace built by Charles III., but it is crossed by the high road, which divides it in two. Facing the palace is a fortress rising out of the sea, and there is a small harbor called the Granatello.

PORTICO, a covered space with a roof supported by columns. It is usually attached to an important building, but sometimes detached, as a shady walk. A portico is called tetrastyle, hexastyle, octostyle, and decastyle, according as it has four, six, eight, or ten columns in front.

PORTION, though not a legal term, is often used in the law of intestacy and legacies, and means a sum of money given to a child in discharge of the obligation incumbent on a parent; and from the circumstance of its being often given on marriage it is called a marriage-portion. By the law of England and Ireland, therein differing from the law of Scotland, a parent is not bound at common law to give any portion to his children. But he often does so by will; and, in the event of his dying intestate, the law does so for him. When a testator by will leaves a legacy to a daughter, child, or person, toward whom he stands *in loco parentis*, and afterward in his lifetime gives the child a like sum of money, or even a less sum as a portion on marriage, such portion is *prima facie* presumed to be in satisfaction, or an ademption of the legacy, unless there is something in the will or settlement to rebut that presumption. But in Scotland there is no such presumption, unless the father was liable by contract to give the portion.—Paterson's *Comp. of E. and S. Law*, 711. See **TOCHER**.

PORTIONERS, in the law of Scotland, mean two or more females who succeed jointly to heritable estate in default of heirs male, corresponding to coparceners in England. See **HEIRS-PORTIONERS**.

PORT JERVIS, a village in Orange co., N. Y., on the Delaware and Hudson canal; a station on the Erie railroad. The place is at the junction of the Delaware and Neversink rivers, and marks the intersection of the boundary lines of Pennsylvania, New York, and New Jersey; pop. '70, 6,377. Port Jervis was named in honor of J. B. Jervis, the chief engineer of the canal. The place is surrounded by picturesque scenery. There are three newspapers, one a daily; three banks, many factories, and railroad repair shops.

PORTLAND, a city and sea-port of Maine, situated on an arm of the s.w. side of Casco bay, lat. 43° 39' n., long. 70° 15' w., 105 m. n.e. of Boston. It is beautifully situated on a peninsula 3 m. long by three-fourth of a mile broad, with broad shaded streets, and handsome public and private edifices. Among the former is a fire-proof iron and granite building for the United States courts and custom-house; a city hall, of olive-colored freestone, 150 by 232 ft.; public halls and libraries, charitable mechanics' association, atheneum, society of natural history's hall and cabinets, public schools, and 27 churches. There are 16 newspapers, 4 of which are daily. The harbor of Portland is large, deep, and well sheltered, and is the winter-station of the Canadian steamers. It is defended by forts Preble and Seammell. There are five railways, including one to Quebec and Montreal, locomotive and marine engine manufactories, sugar refineries, and

a large coasting trade. Portland, first named Falmouth, was settled by an English colony in 1632, and was three times burned in the wars with the French and Indians. In 1866 a fire destroyed \$10,000,000 worth of property. Pop. '70, 31,413.

PORTLAND (*ante*), a city in s.w. Maine; incorporated 1832; Indian name, Machigonne. It was originally a part of Falmouth, and includes several small islands in the bay; 1666 acres; pop. '80, 33,810. It is 60 m. s.w. of Augusta, 292 m. s.e. of Montreal, and is connected with Montreal and Detroit by the Grand Trunk railway, furnishing, since 1853, direct means of transportation from those ports to the sea. It is the terminus of the Boston and Maine railroad, the Portsmouth, Saco and Portland, the Portland and Rochester, the Portland and Ogdensburg, and the Maine Central. Grain is shipped from San Francisco to this city without change. It is the fifth city in size in New England, and its trade with the West Indies, South America, and Europe, as well as along the coast, is important. The annual value of the exportation of lumber, sugar, ice, fish, etc., averages \$22,000,000; the value of the imports being \$20,000,000—four-fifths of it representing transshipments to Canada. The value of the tonnage has exceeded 126,000 in one year. The sales of merchandise are estimated at \$40,000,000; annual value of manufactures \$9,000,000. It has a marginal railway around the water front, and two dry docks. It has regular steam communication between Liverpool and Glasgow and the principal cities on the coast. Besides the forts which protect the harbor there are granite casemated fortifications on Hog Island ledge which command the four entrances. Ship building and the manufacture of iron are important industries, also that of petroleum, carriages, furniture, varnishes, boots and shoes, moccasins, cement pipe, leather, soap, sleighs, jewelry, etc. Canned corn and lobsters are largely exported. It has six national banks with an aggregate capital of \$3,050,000, and two savings banks with deposits amounting to \$8,000,000. It is lighted by gas, has three horse-railroads, and is supplied with water brought 17 m. from lake Sebago to Bramhall's hill in the w. part of the city, the reservoir containing 12,000,000 gallons. The company was organized in 1867. It contains 30 churches, is the seat of the Episcopal bishop of Maine, and of a Roman Catholic bishop. Its charitable institutions include a female orphan asylum, and a home for aged women; among the public institutions are the state reform school, the U. S. marine hospital, and a school for deaf mutes. Besides those mentioned above, it contains more than 60 societies for charitable objects, and the advancement of scientific learning and literature. It is the seat of a medical school, incorporated 1858, and contains the Portland institute and public library, incorporated 1867, 15,000 vols.; the mercantile library, 1851, 5,000 vols., having been collected since the fire of 1866; and the law library. The collections of the society of natural history were burned in 1854 and in 1866, but a new one has been made containing specimens of great value. The atheneum (incorporated 1826) library of 12,000 vols. was destroyed in 1866, but has been restored. Portland has a well-organized fire department. Among the fine buildings for which it is noted is a mechanics' hall built of granite; the granite custom house, ornamented with marble, costing \$485,000; the post-office of white Vermont marble; and the granite and brick building of the Maine charitable mechanic association, incorporated 1815, containing a fine hall, library of 5,000 vols., and costing \$36,000. From the hills on either side a fine view of Casco bay may be obtained. In the center is Lincoln park, $2\frac{1}{2}$ acres.

PORTLAND, a city, the co. seat of Multnomah co., Oregon, on the w. bank of the Willamette river, about 120 m. from the Pacific; pop. '75, 12,500. It is on the Oregon Central and the Oregon and California railroads, and connected by steamer with San Francisco, Olympia, Victoria, and Sitka, and many places on Puget sound and the Columbia and Willamette rivers. It contains churches, schools, a court-house, an insane asylum, 3 banks, 13 newspapers, a library, and a seminary for girls. Among the articles manufactured are engines, boilers, carriages, furniture, nails, and lumber. Large amounts of wheat, flour, and lumber are exported. The city is regularly laid out, and the streets are lighted with gas. The city has water-works, a fire department, and a police department. It was surveyed in 1845, and received a city charter in 1851. The fire of Aug. 2, 1873, caused a loss of more than \$1,000,000. It is a place of much enterprise and business prosperity.

PORTLAND, a t. in St. John co., New Brunswick, next to Saint John; pop. 12,520. It has steam saw-mills, foundries, ship-yards, etc.

PORTLAND BEES, a division of the upper oolites (q. v.) occurring between the Purbeck beds and the Kimmeridge clay, and so named because the rocks of the group form the promontory of the isle of Portland. They consist of beds of hard oolitic limestone and freestone, interstratified with clays, and resting on light-colored sands, which contain marine fossils. The corals found in the sands are often converted into flints, the original structure being beautifully preserved in the hard siliceous. The beds may be traced from the isle of Portland, capping the oolitic hills as far as Oxfordshire. The fossils are chiefly mollusca and fish, with a few reptiles.

PORTLAND CEMENT. See CEMENT.

PORTLAND ISLE, a rocky peninsula projecting into the English channel from the shore of Dorsetshire, 17 m. w.s.w. of St. Alban's head. Its appearance suggests the

shape of a beak, and it is therefore called also the Bill of Portland. It is 9 m. in circumference, is composed of oolitic limestone, and slopes southward, with an even surface from the height of 490 ft. to that of 30 ft. above sea-level. Its sides are extremely rugged, and are worn into fantastic caverns by the furious action of the waves. The peninsula is supposed to have been once an island, but for ages it has been connected with the mainland by Chesil bank, an extraordinary ridge of loose shingle, which, after running n.w. in a straight line close to the shore for about 10 m., joins the mainland at Abbotsbury. South-west winds prevail on this part of the coast, and during their continuance the long ridge of Chesil bank is lashed by a frightful sea, and is the scene of frequent shipwrecks. A long narrow inlet of the sea, called the Fleet, extends between Chesil bank and the shore, and is the haunt of numerous wild-fowl. Portland castle, in the north of the isle, is a ponderous building, erected by Henry VIII. as a protection for this part of the coast in 1520. The peninsula furnishes the famous Portland stone (q.v.). Portland breakwater, built of stones obtained on the island, partly described under the article breakwater (q.v.), has provided a secure harbor for hundreds of the largest ships; in connection with it are also a naval station, harbor of refuge, and batteries. Pennsylvania castle, in a most romantic district on the east coast, was built by John Penn, the grandson of the founder of Pennsylvania. Rufus castle, or, as it is commonly called, Bow-and Arrow castle, also on the east coast, is now a ruin, and is generally said to have been built by William Rufus. On Portland bill, the southern extremity of the island, are two light-houses, one 130 and the other 197 ft. above sea-level. Between the southern point and the shambles, three m. to the s.e., a dangerous surf, well known as the race of Portland, is raised by the rushing of the impetuous tides. The convict prison, near the e. coast, erected in 1848, consists of eight wings, besides the hospital, chapel, barracks, and cottages for the warders. It accommodates upward of 1500 convicts, besides the officers, and is maintained at an annual cost of upward of £50,000, or at the rate of £33 per prisoner. The inhabitants of the island long remained a peculiar people, intermarrying and preserving, generation after generation, the many curious customs of their ancestors. The island itself is chiefly remarkable for its abundant supply of excellent spring water, for its building-stone, and for its breed of sheep, the flesh of which, well known as Portland mutton, is celebrated for its flavor. The pop. of the parish of Portland Isle amounted in 1871 to 9,907.

PORTLAND SAGO. See ARUM.

PORTLAND STONE. This celebrated building-stone, of which many of the principal buildings of London, including St. Paul's cathedral, Somerset house, and many of the churches are constructed, is the oolitic limestone of Dorsetshire, constituting geologically the Portland and Purbeck beds. The quarries are chiefly located in the islands of Portland and Purbeck, and in the vale of Wardour. The quantity raised is very large. During the heavier works at the Portland breakwater 730,000 tons per annum were required for that structure alone, and about 30,000 to 40,000 tons are sent annually to London and other places. There are three different qualities of the stone in the same quarry: the uppermost contains numerous fossils, and is of a coarse grain; it is therefore used chiefly for rough work, such as foundations. It is called roach by the quarrymen. The middle bed is much broken, and is called the rubble or rubby bed, and is of little value; and the lower one is fine, white, and compact, and is called the whit, or best bed. This last is that which is used for fine building purposes. An analysis of this stone by prof. Daniell shows the following composition:

Silica.....	1.20
Carbonate of lime.....	95.16
Carbonate of magnesia.....	1.20
Iron and alumina.....	0.50
Water and loss.....	1.94

Besides which ingredients, there is often a trace of bitumen present.

PORTLAND VASE. A beautiful cinerary urn of transparent dark-blue glass, found about the middle of the 16th c. in a marble sarcophagus near Rome (see the article GLASS, where it is figured and described). It was at first deposited in the Barberini palace at Rome (and hence often called the Barberini vase); it then became (1770) the property, by purchase, of sir William Hamilton (q.v.), from whose possession it passed into that of the duchess of Portland. In 1810 the duke of Portland, one of the trustees of the British museum, allowed it to be placed in that institution, retaining his right over it as his own property. In 1845 a miscreant named William Loyd, apparently from an insane love of mischief or a diseased ambition for notoriety, dashed this valuable relic to pieces with a stone. Owing to the defective state of the law, only a slight punishment could be inflicted; but an act was immediately passed, making such an offense punishable with imprisonment for two years, and one, two, or three public or private whippings. The pieces of the fractured vase were carefully gathered up, and afterward united in a very complete manner; and thus repaired, it still exists in the museum, but is not shown to the public. A small number of copies of the Portland vase were made many years ago by Mr. Wedgwood, and were sold at 25 guineas each.

PORTLAW, a small manufacturing t. of the county of Waterford, Munster, Ireland, about 10 m. w.n.w. of Waterford. Portlaw has risen within the last 40 years from a small village into a town of great activity and of extensive manufactures, through the enterprise of a single family named Malcomson, by whom the cotton manufacture has been introduced with great success. The pop. in 1871 was 3,774, considerably more than 3,000 of whom were Roman Catholics, the remainder being principally Protestant Episcopalians. Portlaw is admirably provided with schools and other institutions for the social and moral improvement of the population.

PORT LOUIS, the capital and principal port of the British colony of Mauritius, is situated on an inlet on the n.w. coast. Its streets, though narrow, are straight, and are furnished with footpaths, and macadamized. It contains a number of public buildings, among which are a theater, library, hospital, and botanic garden. Its harbor is capacious, but is quite safe only during the fine season. The imports and exports of the colony are mainly transacted at Port Louis; and their quantity, value, and character are mentioned under the article Mauritius (q.v.). Pop. of the port is estimated at 65,000 (1871).

PORT MAHON (anc. *Portus Magonis*), the capital of the island of Minorca (q.v.), is beautifully situated on a deep and narrow inlet in the s.e. of the island. Its harbor, sufficiently spacious to accommodate a large fleet of men-of-war, is one of the finest in the Mediterranean, and is protected by three forts. It has no architectural features worthy of special notice, but is on the whole well built. The military governor and the bishop of the island reside here. The government buildings were mostly constructed while the island belonged to England. Pop. 13,300.

PORTNEUF, a co. in central Quebec, Dominion of Canada, having the St. Lawrence river for its s. boundary, drained by the river St. Maurice, the Portneuf river, the Great and Little Wayagamack lakes, and lake Edward in the n.; 7,255 sq.m.; pop. '71, 23,216. Its surface is generally level, with a fertile soil. The country is well timbered, and its rivers furnish extensive water-power for carding, saw, and grist mills. It has a large trade in flour and lumber. The manufacture of nails is among its industries. Co. seat, Cap Santé.

PORTO ALE'GRE, a t. of Brazil, capital of the province of Rio Grande do Sul, stands at the n.w. extremity of the lake of Patos, by means of which it communicates with the sea. It was founded in 1743, is well built, and contains 20,000 inhabitants. It is provided with wharfs; and its trade, though by no means inconsiderable, has hardly shared to the full in the recent advancement of the prosperity of Brazil.

PORTO-BELLO, a parliamentary burgh and watering-place, occupies a plain on the s. bank of the firth of Forth, in the county of Edinburgh, and 3 m. e. of the city of that name by the North British railway. A commodious new town-hall was recently built. This town is a favorite resort for sea-bathing and summer quarters during the season. A marine promenade, a m. in length, runs along the shore; and there is an elegant iron pier, 1250 ft. long, with seats to accommodate 2,000 persons, and a spacious saloon for the use of visitors. Porto-Bello is also a manufacturing town, and its manufacturing establishments comprise potteries, and earthenware, bottle, brick, and paper works, etc. Pop. '71, 5,373; and, in summer, between 7,000 and 8,000. The town derives its name from the first house built here about the time of the seizure of the town of Puerto-Bello, in the isthmus of Panama, and called Portobello.

PORTO BELLO. See PUERTO BELLO.

PORTO FERRA'JO. See ELBA.

PORTO MAGGIO'RE, a t. in the province of Ferrara, Italy, 4 m. e. of Commachio, and about 20 m. from the Adriatic; pop. '74, 15,150. The town is an island in the lagoons of the Commachio, and the inhabitants are employed in eel-fishing and in trading in cattle. The climate is malarious. There is an improbable tradition that the place was in former centuries a sea-port.

PORTO-MAURIZIO, a seaport t. of n. Italy, capital of a new province of the same name, on the gulf of Genoa, 58 m. directly s.w. of Genoa city. Area of province, 467 sq. miles. Pop. '71, 126,953. The town stands on a high promontory, projecting boldly into the sea, and has a lofty church, painted in brilliant colors. The harbor, defended by a mole, is generally crowded with the picturesque coasting-vessels of the Mediterranean. There is an extensive trade in olive-oil and agricultural produce. Pop. 6,256.

PORTO NOVO, a t. in the Madras presidency of India, situated on the Coromandel coast, in lat. 11° 31' n., and long. 79° 51' east. Both the Danes and the Dutch had formerly a factory here. The place is celebrated for the battle fought here on July 1, 1781, when sir Eyre Coote defeated Hyder Ali. The British force consisted of only 7,878 men, including artillery; Hyder's army numbered over 60,000. Coote was retiring before Hyder. After leaving Porto Novo, he had only advanced a few m. along the sea shore, when he found his path intercepted by the enemy's batteries, the sea confining him on the right, and a range of sand-hills on the left. The British army made two assaults; in one, they carried the batteries; in the other, they took advantage of an opening in the sand-hills, which Hyder had neglected to guard, and came suddenly upon the ene-

my's flank. A schooner of war meantime standing in close, poured her broadsides of small guns into the enemy. Their rout was complete. Porto Novo is celebrated for its iron foundry, which of late years has supplied much of the material for the Madras railways. Pop. of Porto Novo, called by the natives *Parangipetta*, about 7,200.

PORTO RICO. See PUERTO RICO.

PORTO SANTO, an island in the Atlantic ocean, 25 m. n.e. of Madeira, to which it belongs; about 24 sq. m.; pop. about 1500. The surface is uneven, with little timber. The soil is barren. The principal productions are barley, corn, live stock, and a poor variety of wine.—The town of Porto Santo has a good harbor, resorted to by ships going round the cape of Good Hope. Columbus at one time lived at Porto Santo, which was discovered by the Portuguese in 1418.

PORT PATRICK, a burgh of barony and fishing village of Scotland, in the county of Wigtown, and 8 m. s.w. of Stranraer. It is surrounded by hills on the land side, and its harbor is protected by two piers, and has a light-house. It is the nearest point of Scotland to the Irish coast, distant only 21½ miles. Pop. '71, 1488.

PORT PHILIP. See MELBOURNE.

PORTREE. See SKYE.

PORTREEVE (from *port* and *reeve*, Saxon *gerefa*, a word of similar origin to the German *graf*, signifying a governor or chief magistrate), the principal magistrate in a maritime town. This was the early name of the officer afterward called mayor in London and elsewhere.

PORT ROYAL-DES-CHAMPS, a convent of Cistercian nuns, near Versailles, which obtained much celebrity during the 17th century. It was founded for nuns by a member of the family of Montmorenci, in the early part of the 13 c.; and soon after its establishment, obtained from the pope the privilege of receiving lay persons, who, without taking monastic vows, desired to live in religious retirement. This portion of the Port Royal-des-Champs institute in later times became of great importance. The discipline of the convent having been much relaxed in the 15th and 16th centuries, one of its worst abuses—that of appointing the superior, not on account of fitness, but from considerations of family or other worldly or political motives—became in the end the occasion of its complete reformation. Angelique Arnauld, sister of the celebrated brothers Arnauld, was appointed, when a mere child, coadjutrix of the abbess, and on the death of this lady, although she was then only in her eleventh year, herself succeeded to the office. As *mère* Angelique advanced in years, she felt moved, although still very young, by a profound sense of her responsibilities, and undertook a complete and rigid reformation of the community, which she carried out in all its details—as the strict observance of religious poverty, abstinence from meat, complete seclusion, and the most severe ascetic exercises. The community was removed to Paris in 1626, and in 1633 to a new convent, which was thenceforward called Port Royal-de-Paris; and from this time the old establishment of Port Royal-des-Champs was exclusively devoted to the use of a lay community, in accordance with the original papal privilege. This community quickly became very celebrated, and soon numbered among its inmates some of the most distinguished scholars of that age, Antony Arnauld, Le Maistre, Antony and Louis Isaac le Maistre de Sacy, Nicole, Lancelot, Sericourt, and several others. Their rule of life was most austere, rising at 3 A. M., devoting many hours to prayer and spiritual reading and instruction, and a portion of the day to manual labor. One of their most important public services was the establishment of a school, for which they prepared the well-known educational books known under the name of Port Royal, the Greek and Latin grammars, general grammar, geometry, art of thinking, etc. This school was for a time transferred to Paris, a portion of the nuns being sent back to Port Royal-des-Champs; but eventually it was established at an out-farm of the latter place, called Les Granges.

Port Royal-des-Champs, however, is even more known in history through its relations with the Jansenist controversy. The nature and origin of these relations have been explained in the article Jansen (q.v.). It only remains to relate the later fortunes of Port Royal-des-Champs and its members, in so far as they were affected by the proceedings taken in consequence by the authorities, whether civil or ecclesiastical. The nuns of Port Royal-des-Champs having refused to subscribe the formulally condemning the five propositions, a royal order was issued in 1630 for the suppression of the school, and the removal of the boarders of Port Royal-des-Champs; and at length the abbess, and several other nuns, were arrested, and confined as prisoners in other monasteries. After the "peace of Clement IX.," they were permitted to return; but the two communities, Port Royal-des-Champs and Port Royal-de-Paris, were placed under separate government. This led to many disputes, and to a perpetuation in Port Royal-des-Champs of the Jansenistic spirit and the Jansenistic opinions; and when the final steps for the repression of that party were taken about 1707, a formal bull was issued by pope Clement XI. for the suppression of that convent, and the transfer of its property to Port Royal-de-Paris. The nuns, accordingly, were finally dispersed and distributed over convents of different orders throughout France. The property of the convent and church were transferred to the Paris-house, and all the buildings of Port Royal-

des-Champs were leveled to the ground, by order the king. Most of the eminent names connected with Port Royal-des-Champs will be found treated under separate heads.

PORT SAID, a t. in Egypt, about 30 m. s. of Damietta, at the Mediterranean end of the Suez canal; pop. about 8,500. It contains a reservoir and a light-house. Its harbor, made by colossal piers of concrete, has ample docks and accommodations for vessels. It has an export trade in cotton, and is a coaling station of importance.

PORTSEA ISLAND, a small island on the s. coast of Hampshire, has on its w. side Portsmouth harbor, on its s.e. side Langston harbor, on its e. side Chichester harbor, and is separated from the mainland on the n. by a narrow channel, crossed by several bridges. It is 4 m. long, by from 2 to 3 m. broad, and contains the important towns of Portsea and Portsmouth (q. v.).

PORTSMOUTH, a city and the only sea-port of New Hampshire, is on the s. bank of the Piscataqua river, 3 m. from the Atlantic, and 54 m. n.n.e. of Boston; a well-built town, having 10 churches, atheneum, state arsenal, academy and public schools, 2 market-houses, alms-house, 5 banks, manufactories of cotton and hosiery, foundries, and breweries. There is a safe and deep harbor, a U.S. navy-yard, having a balance-dock 350 ft. long, and 2 forts, McCleary and Constitution. Settled in 1623. Pop. '70, 9,211.

PORTSMOUTH (ante), a city in s.e. New Hampshire, incorporated 1849; previous to 1807 capital of the colony and state, except during the revolution. It is the terminus of the Eastern, Concord and Portsmouth, the Portsmouth and Dover, and the Portland and Saco railroads; pop. '80, 9,732. It is nearly surrounded by water, and is connected by bridges across the Piscataqua with Kittery, Me., where is what is commonly called the Portsmouth navy-yard, and with Newcastle on Grand island. Many ships are built here for the merchant service, and the harbor is capable of accommodating 2,000 vessels with good anchorage, 480 having found shelter there at one time by actual count. The depth of water varies from 35 to 75 feet. The harbor contains many small picturesque islands, and the tides and rapid current preserve it from ice and sand-bars. Forts Constitution and McClary having been condemned, earthworks have been erected at the e. side of the entrance, and on Jerry's point, on the w. side. The city has an ancient, conservative appearance, and in summer is beautifully shaded by numerous ornamental trees; and on the hillside sloping toward the harbor are the fine old estates with large gardens attached which give it the character for health and beauty for which it is distinguished. The floating balance-dock in the navy-yard was constructed at a cost of \$800,000, has 24 pumps, and 2 steam-engines. In 1690 the *Falkland*, 54 guns, was constructed here by order of the British government; the *America*, 50 guns, in 1749, for the same power; the *Ranger*, 18 guns, 1777, by order of the continental congress, of which Paul Jones was first commander—the first to carry the stars and stripes and to receive the salute; and the *North America*, built on Badger's island. The city has good educational advantages, a library of 11,000 volumes, and a reading-room in the atheneum; also a cabinet of minerals and specimens of natural history. It contains a mercantile library association with 2,000 vols. It has 6 newspapers, including the oldest newspaper in America, established 1756, called *The New Hampshire Gazette*. Its local trade is important, and its commerce considerable along the coast and with foreign ports. Among the articles of manufacture are iron castings, shoes, cod liver oil, soap, carriages, sleighs, etc. It contains the Kearsarge cotton mills, 26,000 spindles. It is well supplied with water, and has 6 banks, 4 national, with an aggregate capital of \$950,000, and 2 institutions for savings, with deposits to the amount of \$2,750,000, a trust and guarantee company with a capital of \$200,000, 2 military companies, and a well-organized fire department. At Rye, formerly Little Harbor, is the mansion of gov. Wentworth, and near the navy-yard is the tomb of sir William Pepperell.

PORTSMOUTH, a village of Ohio, on the n. bank of the Ohio river, at the mouth of the Scioto, the terminus of the Scioto and Hocking Valley railway, and Ohio and Erie canal, 115 m. e. by s. from Cincinnati, and 90 s. of Columbus. It has 14 churches, 2 iron foundries, 3 machine-shops, 2 distilleries, 6 banks, and 5 newspapers. Pop. '60, 6,268; '70, 10,592.

PORTSMOUTH (ante), a city in s. Ohio, 170 m. below Parkersburg, W. Va.; the s. terminus of the Portsmouth branch of the Marietta and Cincinnati railroad; pop. '80, 11,314. Its harbor is accessible to the largest vessels, and is $\frac{2}{3}$ of a mile wide. It is connected by a line of steamers with Baltimore. Hills of moderate height rise above the plain on which it is built, and on the opposite shore of the river the bank rises to the height of 500 feet. It has a court-house, 14 churches, public schools, a young ladies' seminary, 7 building associations, 5 national banks with an aggregate capital of \$950,000, an opera house, a masonic temple, and 2 odd fellows' halls. It is lighted by gas and supplied with water by the Holly system. Among its manufactures are paper, engines and boilers, agricultural implements, hubs, stoves, furniture, and soap; among its manufactories are lumber mills and 2 freestone saw-mills. In the vicinity are valuable beds of iron, which is mined and largely exported. The products of the mineral regions of s. Ohio and n. Kentucky are shipped from this point. Its commerce is important and constantly increasing, and it is the center of the fertile district of the Scioto valley.

PORTSMOUTH, a city and port of Virginia, on the w. bank of Elizabeth river, opposite Norfolk, and 8 m. from Hampton Roads. It has a court-house, scientific and military academy, 5 newspapers, 13 churches, tobacco factories, etc., and connections with the southern railways. Its proximity to fortress Monroe caused it to be held, during the war of secession, by the federal forces. Pop. '70, 10,492.

PORTSMOUTH (*ante*), a city in s.e. Virginia, in Norfolk co., 1 m. s.w. of Norfolk, 150 m. by water, and 104 m. by rail, s.e. of Richmond; on the Atlantic, Mississippi and Ohio railroad, at the terminus of the Seaboard and Roanoke; pop. '80, 11,388. It is connected by ferry with Norfolk, and lines of steamers run to all the principal cities on the coast, by which cotton, lumber, oak staves, pig iron, and vegetables are shipped in large quantities. It has also a considerable wholesale trade in coal, fertilizers, groceries, and liquors. It is regularly laid out on a low, level plain. At Gosport, at the s. extremity of the city, is the U. S. navy-yard, dry dock, and naval hospital. Its harbor is conveniently accessible to the largest vessels, and its leading industries are the manufacture of cars, carriages, and barrels. It has 2 banks, an insurance and banking company, 3 hotels, 2 academies, public schools, and many private schools.

PORTSMOUTH, the chief naval arsenal of Great Britain, and an important seaport, market-town, and municipal and parliamentary borough, in the s. of Hampshire, stands on the s.w. shore of Portsea island (q.v.), at the entrance to Portsmouth harbor, and opposite the town of Gosport, with which it communicates by means of a steam-bridge. It is 74 m. s.w. of London by the London and South-western railway. Besides the parish of Portsmouth, the limits of the municipal and parliamentary borough, which are co-extensive, include also the parish and town of Portsea, and the out-wards Landport and Southsea. The population of the borough, with its suburbs, was (1871) 113,569. Portsmouth is for the most part a mean-looking, dirty town; but has the most complete fortifications in Britain. These comprise, on the landward side, the outer line of the Portsdown forts and the Hillsa lines; to seaward, the Spithead forts. The bastioned ramparts, which formerly encircled both Portsmouth and Gosport, and were so imposing in appearance, have recently been removed as useless. Southsea, which is situated outside the walls skirting Southsea common, is rapidly increasing, and is now a fashionable watering-place. In the town proper there are few objects of note. Pleasing views may be had from the ramparts and batteries, as the harbor, the roadstead of Spithead, and the isle of Wight, on the coast of which the white walls of the royal residence of Osborne house are seen gleaming among the trees. Among the few notable buildings may be mentioned the church of St. Thomas, the chancel and transepts of which date from the 12th c., and which contains a ghastly cenotaph in memory of the murdered duke of Buckingham (see *infra*). In front of the garrison chapel is buried the brave sir Charles James Napier (q.v.), who died in this neighborhood in 1853. The dockyard of Portsmouth, in the district of Portsea, was till lately only 116 acres in extent; but vast works have recently been carried out, at a cost of £2,500,000, which have increased the area to a total of 293 acres. Of this immense naval establishment, the most noteworthy if not the most recent features are the mast and rope houses, hemp-stores, rigging stores, sail-loft, and the dry docks, spacious enough to admit the largest vessels, and offering every facility for their speedy repair. The 12 docks vary from 22 to 36 ft. deep, lined with solid masonry, and roofed over, and closed by lock-gates. Of the various building-slips, one of them, roofed and covered in, is so large that three or four vessels can be in process of construction under it at the same time. The wood mills contain a number of most ingenious block-making machines, the invention of sir Isambard Brunel, in which rough timber, introduced at one end, is cut, squared, drilled, bored, and turned into the required shape. About 150,000 blocks are made here annually, and the machines require the attendance of no more than four men. In the smithy, anchors are forged by aid of a Nasmyth's hammer. The dockyard also contains the residences of the superintending officers and a school of naval architecture.

Portsmouth harbor, about 420 yards wide at its entrance, expands into a spacious basin, extending inland for about 4 m., and having a breadth of 3 m. along its northern shore. Large war-vessels can enter and lie at anchor at all times of the tide. The outward entrance is defended by Monkton fort and Southsea castle. The position of this harbor is highly favorable. It is situated in the middle of the channel, close to the magnificent anchorage of Spithead, where 1000 ships of the line may ride without inconvenience, and is under shelter of the isle of Wight, and opposite the French arsenal of Cherbourg.

The local trade of Portsmouth is supported by the dockyard and the other public establishments of the town. Brewing is largely carried on. Coals, cattle, sheep, corn, and provisions are imported from our own coasts, and timber and wine from abroad. In 1875, 1937 vessels, of 185,756 tons, entered, and 1080, of 53,446 tons, cleared the port.

The importance of this port dates only from the reign of Henry VIII. Its defenses were strengthened by Elizabeth, and afterward in a more thorough manner by William III. Here, in a house that still remains in the High street, and which was then an inn called the "Spotted Dog," the duke of Buckingham (the "Stenie" of king James) was assassinated by John Felton. On Aug. 29, 1782, when its commander, admiral Kempenfeldt, was writing in his cabin, the *Royal George* went down in the harbor, and nearly 1000 lives were lost.

PORTUGAL, the most westerly kingdom of Europe, a part of the great Spanish peninsula, lies in $36^{\circ} 55'$ to $42^{\circ} 8'$ n. lat., and $6^{\circ} 15'$ to $9^{\circ} 30'$ w. long. Its greatest length from n. to s. is 368 m., and its average breadth from e. to w. about 100 miles. The kingdom of Portugal proper is bounded by the Atlantic on the s. and w., and by Spain on the n. and east. The table gives the area and pop. of the seven old provinces, still popularly retained, with the corresponding official districts:

PROVINCES.	DISTRICTS.	Area in Square Miles.	Pop. 1875.
MINHO.....	Viana, Braga, Porto.	2,810	973,332
TRAS OS MONTES.....	Braganza, Villa-Real.	4,275	374,837
BEIRA ALTA.....	Aveiro, Coimbra, Viseu.	4,533	930,730
BEIRA BAIXA.....	Guarda, Castello-Branco.	4,688	388,868
ESTREMADURA.....	Lelria, Santarem, Lisboa.	6,907	853,876
ALEMTEJO.....	Portalegre, Evora, Beja.	9,289	342,979
ALGARVE.....	Faro.	1,868	192,916
Total.....		34,470	4,057,538

Islands.—The Azores, 920 sq. m.; pop. '75, 261,746. Madeira, etc., 330 sq. m.; pop. 121,753. The islands are officially reckoned as belonging to the home territories.

The colonial possessions of Portugal are, in *Africa*—Cape Verd islands, 1630.02 sq. m.; pop. 76,003. Senegambia, 35,437.50 sq. m.; pop. 8,500. Islands of San-Thome and Principe, off Guinea, 448.56 sq. m.; pop. 23,681. Ajuda, 12 sq. m.; pop. 700. Angola, Benguela, 200,602.50 sq. m.; pop. 2,000,000. Mozambique and dependencies, 283,500 sq. m.; pop. 300,000. In *Asia*—Goa, Salcete, 1440.6 sq. m.; pop. 474,234. Damao, Diu, 94.08 sq. m.; pop. 53,283. In the Indian Archipelago, 2,877 sq. m.; pop. 250,000. Macao, 11.76 sq. m.; pop. 71,739. Total of colonies, 526,041.48 sq. m.; pop. 3,258,140.

Physical Aspect, etc.—Portugal must be regarded as essentially a littoral country, forming the Atlantic or western part of the Spanish peninsula, from which it is separated by political, rather than physical boundaries. Its mountains and rivers are, with few exceptions, mere western prolongations of those of Spain. The principal mountain ranges lie about half-way inland, leaving almost the whole of its 500 m. of coast-line a flat sandy tract, with few rocky headlands, and hence there are scarcely any harbors or places of safe anchorage, except at the embouchures of the larger rivers. The highest range is the Serra de Estrella, which, passing from n.n.e. to s.s.w., through Beira and Estremadura, terminates in the steep acclivities of Cintra and Cap la Rocca, near Lisbon. The principal chain, which is also known as the Serra da Junto, merges in a series of ridges, which cover a tract 30 m. in length, between the Tagus and the sea. Another mountain range, named the Serra de Calderao and the Serra de Monchique, but constituting a mere continuation of the Spanish Sierra Morena, crosses the southern part of Portugal from e. to w., and terminates in its most southern promontory of Cape St. Vincent. These ranges, with the numerous mountain-spurs that intersect the northern districts in every direction, so thoroughly occupy the area of Portugal that there are only two or three plains of any extent in the whole country, and these are situated to the w. of the Guadiana, in Alemtejo, and in Beira and Estremadura, near the Tagus and Vouga. The valleys are very numerous, and by their great fruitfulness present a striking contrast to the barren and rugged mountains by which they are inclosed. The principal rivers enter Portugal from Spain. Of these the largest are the Guadiana, which, leaving Spain near Badajoz, forms in part the boundary between the southern provinces of the neighboring kingdom; while the Minho and Douro, flowing w., form a part of the boundary in the n. and n.e. The Tagus, or Tejo, intersects Portugal from its northern frontier to the southern termination of the Estrella mountains, where it enters the sea a little below Lisbon. The Mondego, the largest river belonging entirely to Portugal, after receiving numerous affluents in its course, falls into the sea about midway between the Douro and the Tagus. The larger rivers, although obstructed at their mouth with dangerous bars, afford admirable means of internal navigation, together with the numerous lesser streams, and might, through canals, be connected into one great system of water-routes; but hitherto nothing has been done to improve these great natural advantages. Except a few mountain tarns, Portugal has no lakes. It has salt-

marshes on the coast, near Setubal in Estremadura, and Aveiro in Beira, whence large quantities of salt are annually obtained by evaporation. Mineral springs are abundant in many parts of the country, but hitherto they have been almost wholly neglected.

The vicinity to the western ocean tempers the climate of Portugal and exempts it from the dry heat by which Spain is visited. The great inequalities of the surface produce, however, great diversities of climate; for, while snow falls abundantly on the mountains in the northern provinces, it is never seen in the lowlands of the southern districts, where spring begins with the new year and harvest is over by midsummer. Rain falls abundantly, especially on the coast, from October to March, and, as a general rule, the climate is healthy in the elevated districts even of the southern provinces; but malaria and fever prevail in low flat lands and near the salt marshes. The mean annual temperature at Lisbon is 61° Fahr.

The natural products correspond to the diversity of the physical and climatic conditions; for while barley, oats, and wheat, maize, flax, and hemp, are grown in the more elevated tracts, rice is cultivated in the lowlands, the oak thrives in the northern, the chestnut in the central, and the cork, date, and American aloe in the southern parts, while every species of European, and various kinds of semi-tropical fruits and vegetables, are grown in different parts of the country. The soil is generally rich, but agriculture is everywhere neglected, and is scarcely made subservient to the wants of the population. The cultivation of the vine and that of the olive are almost the sole branches of industry; from the former is derived the rich red wine familiarly known to us as port, from its being shipped at *O Porto*, "the port." The mineral products include gold, antimony, lead, copper, marble, slate, coal, iron, and salt, but of these the last is alone worked in sufficient quantity for exportation, and is in eager demand for the British market, on account of its superior hardness, which adapts it specially for the salting of meat for ships.

The finest cattle are reared in the n., the horses of Alentejo and the sheep of Beira are most valued. Mules and asses are the principal beasts of burden. Goats and pigs are numerous, and are raised at a very low cost in all the mountain districts. The rearing of bees and silk-worms is being pursued with somewhat increased energy of late years. Fish is abundant in all the rivers and on the coast. The tunny and anchovy fisheries of Algarve are of considerable importance.

Commerce, &c.—The commercial industry of the country falls very far below its physical capabilities, and Oporto and Lisbon are the only centers of manufacture and trade, the former of which has important silk and glove manufactories, and produces an inconsiderable quantity of linen, cotton, and wool fabrics, metal and earthenware goods, tobacco, cigars, leather, &c. But in the 19 years preceding 1870 the agricultural exports had doubled. In 1873, 4,941 foreign vessels entered, and 4,973 cleared the ports of Portugal; of Portuguese sea-going vessels, 724 entered, and 1102 cleared; and of coasters, 5,452 entered, and 5,134 cleared. In June, 1878, 674 m. of railway were open, and 154 more in course of construction, principally in the environs of Lisbon, Oporto, Santarem, and Vigo; but the country is almost entirely without roads, the few which exist having been made only within the last thirty years, before which time the whole of the kingdom was in the same impassable condition in which the southern provinces still remain. The scarcity and inefficiency of bridges and the total want of canals render internal traffic almost impracticable, and, as a matter of course, put an impassable barrier in the way of the progress of civilization and the growth of material prosperity.

The exports, which consist almost entirely of wine, fruits, oil, and cork, are chiefly sent to Great Britain and her colonies. In 1875 the exports from Portugal to England were valued at £2,444,071. Among these exports, the wine alone monopolized two-thirds of the total value. The great bulk of Portuguese imports are from the United Kingdom, and in 1875 had a value of £2,563,067.

The budget for 1876-77 gives the total of the receipts, which are derived from direct and indirect taxation and from the national domains, at 24,059,984 milrêis; while the expenditure, including home and foreign debts, the charges of the state, public works, &c., is estimated at 25,062,727 milrêis (1 milrêis = 55 pence). There has been no budget for the last 30 years without a deficit. The budget for the foreign possessions of Portugal gives for the same year the receipts at 2,027,124 milrêis; expenditure, 1,930,164 milrêis. The national debt in 1876, including foreign loans, amounted to 355,778,014 milrêis (upward of £79,000,000).

Army and Navy.—The actual strength of the army was, in 1877, rated at 1512 officers and 38,917 men. The colonial army has 547 officers and 7,298 men. The navy consisted in 1876 of 26 steam-vessels, carrying 133 guns, and 11 vessels without steam-power, with 35 guns. The principal naval depots are at Lisbon and Oporto. Portugal has 55 fortresses, the greater number of which are mere fortified castles. Among the more important are Elvas, S. Julians Cascaes, Pimínhe, Almeida, and Valença. There are six orders of knighthood—viz., the order of Christ, founded in 1319; St. Benedict of Avis; the tower and sword, founded in 1459, and reorganized in 1808; our lady of Villa Viçosa, established in 1819; and the order of St. John of Jerusalem, which was separated in 1802 from that of Malta. Besides these, there is one civil service order, founded in 1288.

Religion, Education.—Portugal belongs almost exclusively to the church of Rome,

and shows little toleration to other creeds. At Lisbon and Oporto, Protestant places of worship are, however, sanctioned by the government. Portugal is divided into three dioceses, which are presided over by the cardinal patriarch of Lisbon, the archbishop of Braga, who is primate of the kingdom, and the archbishop of Evora; and these, with the fourteen bishops, belong to the grandee, or higher nobility. The number of clergy holding cures is given at 18,000. The monasteries have been dissolved since 1834, but convents for nuns still exist. Portugal stands below the other countries of Europe in regard to education; which is now superintended by a superior council, at the head of which is the minister of the interior. Public education is entirely free from the supervision and control of the church. Compulsory education was enacted in 1844, but is far from fully enforced. In 1874 there were in Portugal and its islands 2,631 elementary schools, with 2,212 male and 509 female teachers, and 113,000 pupils; there are 18 lycæums, and 57 other secondary schools; polytechnic academies at Lisbon and Oporto; and clerical, medical, naval, and military training schools. The one university at Coimbra, one of the oldest in Europe, has 5 faculties, 52 professors, and about 1000 students. Lisbon has a learned society (the academy of sciences), and a public library of 300,000 volumes.

Law, Government, etc.—The administration of the law is effected by means of 111 courts of justice, 6 of which are located at Lisbon, where also the high court of appeal holds its sittings. The courts are public, and in some cases trial by jury is adopted. Excepting in regard to suits referring to trade, law is still administered in accordance with the Alfonsine code of the 15th c., and the Código Filippino, or code of Philip IV. of Spain.

Portugal is a constitutional monarchy, the crown being hereditary alike in the female and male lines. The houses of representatives are called *cortes*, and consist of the *camaras dos pares*, and the *camaras dos deputados*, the former composed of grandees, chosen for life by the sovereign, and the latter of 149 members, elected by voters. The monarch is assisted by a cabinet of six ministers of state, and a council composed of members chosen for life. He bears the title of king of Portugal and of Algarve "on both sides of the ocean." The heir-apparent bears the title of prince of Beira. The winter residence of the king and court is the palace dos Necessidades at Lisbon, which at other seasons is exchanged for the palaces at Mafra, Queluz, Bemfica, and Ramalhao. The nobility is divided into *titulados* and *fidalgos*, and these, with the upper officials, higher clergy, etc., constitute one-eighth of the whole population. Very many of the *fidalgos* having been reduced to the condition of paupers, subsisting on charity, a law was passed in 1844, partly abolishing hereditary aristocracy, it being made dependent on the possession of an annual income of £500, together with an academical degree. The members of the second chamber are chosen directly by all citizens having an income of £22. The deputies must have at least £89 per annum; but graduates of any of the learned professions need no property qualifications. Lisbon (q.v.), the capital, is the center of the small amount of literary, artistic, and manufacturing activity in Portugal. Besides Oporto (q.v.) and the capital, there is no city whose population exceeds 20,000, and only 11 which have more than 10,000 inhabitants.

Race.—The Portuguese are a mixed race. In Algarve and Alemtego the Arabic element is still very perceptible, and the people of those provinces have dark-brown skins, and tall, slim, but lithe and active figures; while the natives of the more northern districts, with lighter skins, have less regular features, small eyes, and short, thick-set figures. Although the Portuguese may very probably be regarded as the remains of the original population of the Peninsula, they differ essentially from their Spanish brethren, whom they now regard with inveterate hatred and jealousy on account of their attempts a few centuries ago to annihilate the independence of Portugal. They indulge in interminable verbosity, ceremonious flattery, and servile politeness, and they are inclined to extravagance and display. They are, however, intensely patriotic, brave, persevering, enterprising, cheerful, and ready to oblige. As a people, they are dirty and slovenly; few persons among them possess any great degree of mental culture, and the lower orders are even unable to read or write, and hence the grossest superstition and bigotry prevail in every class of the population.

History of Portugal.—The earliest notice which we have of the western portions of the Spanish peninsula, is derived from the Romans, who followed the Carthaginians as conquerors of the territories of the ancient Iberians and western Celts. Under Augustus, the peninsula was divided into three provinces, governed by prætors, of which the western province of Lusitania comprised the greater part of the present kingdom of Portugal, besides portions of Leon and Spanish Estremadura. When the Romans withdrew from the peninsula, which was rapidly overrun by Visigoths from the north, and at a later period by Saracens from the south, Lusitania was overwhelmed in one common ruin with Iberia or ancient Spain. About the middle of the 11th c. it fell under the sway of Ferdinand I. of Castile. In 1095 Henry of Burgundy, who had married a natural daughter of Alfonso VI. king of Castile, the successor of Ferdinand, received from that monarch the government of Portugal from the Minho to the Tagus, as a dependent fief. It is maintained, however, by Portuguese authorities, that even from this time the country was independent. His son, Alfonso I., gained signal advantages over the Arabs, and, by his gallantry and prudence, secured the affections of the people. After the great

victory which he gained over the Moslems, in the plain of Ourique, in Alemtejo, in 1139, his soldiers proclaimed him king. His successes on this occasion inflicted a serious check on the advance of the infidels, and in recompense for the services which he had thus conferred on Christendom, the pope confirmed his title, which had been unanimously ratified by the cortes of Lamego. The Burgundian house, which continued in possession of the throne for 400 years, gave to Portugal some of its noblest and best kings. The immediate successors of Alfonso I. were engaged in many severe struggles with the clergy and nobles, who were always ready to combine against the sovereign; but although often baffled in their attempts to uphold the independence of the crown, the dignity of the kingdom was, on the whole, well maintained by the representatives of this family, who are, moreover, distinguished as the promoters and upholders of the maritime glory of Portugal. Dinis (Dionysius), who succeeded Alfonso III. in 1279, must be regarded as the founder of Portuguese commerce and mercantile enterprise. This king, moreover, encouraged the industrial arts, and protected learning, in furtherance of which he founded, in 1284, a university at Lisbon, which was transferred, in 1308, to Coimbra. Dinis was succeeded in 1325 by his son, Alfonso, surnamed the brave, whose reign was almost wholly occupied in wars with the Castilians and the Moslems. With Alfonso's grandson, Ferdinand I., the legitimate branch of the Burgundian house became extinct in 1383. After some disturbances, his illegitimate brother, Joam (John), was recognized by the cortes as king in 1385. His reign was eventful, not merely on account of the internal reforms which he introduced into the state, and of his steady maintenance of the prerogatives of the crown, but chiefly as being associated with the commencement of those vast and important geographical discoveries and commercial enterprises, to which Portugal owed the position she occupied during that and the succeeding age as the greatest maritime power of Europe. To Joam's son, Enrique (Henry) the navigator, is due the merit of having organized various voyages of discovery, and inaugurated a regular system of colonization, which, during the reign of Joam II. (who ascended the throne in 1481), culminated in the successive acquisition by Portugal of the Azores, Madeira, Cape de Verde, and other islands; in the doubling of the cape of Good Hope under Bartholomeo Diaz; and, as the result of the latter, in the successful achievement of the passage by sea to India, which was effected, in 1497, under the command of Vasco de Gama, in the reign of Joam's successor, Manoel. The discovery of Brazil, and the settlements made there and on the western coast of India, increased the maritime power and fame of Portugal, which were further extended under Manoel's son, Joam III., who ascended the throne in 1521. At this period, Portugal ranked as one of the most powerful monarchies in Europe, and Lisbon as one of its most important commercial cities. Sudden as this course of prosperity had been, its decline was almost more abrupt, and may in a great measure be referred to the influence of the priests, for the introduction into Portugal of the inquisition in 1536, led to the expulsion of the numerous wealthy and industrious Jews, on whose able financial management the commercial interests of the Portuguese were largely dependent and gave rise to an amount of social tyranny and oppression, both in the colonies and at home, which, coupled with a bad system of government, depressed the energy and crippled the resources of the nation. The influence of the Jesuits under the minority of Joam's grandson, Sebastian, and their evil counsels in urging their young king to enter upon a fatal expedition to Africa against the infidels, led to still further miseries. The defeat of the Portuguese, and the capture and death of the young king at the battle of Alcazar in 1578, and the extinction of the old Burgundian line in 1580, after the brief reign of Sebastian's uncle, Enrique, plunged the country into difficulties and misfortunes of every kind, which lost none of their weight, although they changed in character. After a struggle for the throne between many eager candidates, none of whom found favor with the nation at large, who persisted in cherishing the delusive hope that Sebastian was still alive, and would return from the hands of his infidel captors, Philip II. of Spain succeeded in securing to himself the crown of Portugal, and annexing the Portuguese kingdom to the Spanish monarchy. This event proved disastrous in the extreme to Portugal, for, besides bringing the country to the brink of ruin, by mal-administration and misappropriation of its resources, it involved it in all the ruinous wars of Spain in the Low Countries and in Germany, a great part of the expenses of which it was made to bear; while the Dutch, in retaliation for Spanish aggressions at home, attacked the Portuguese settlements in Brazil, and almost completely deprived them of their possessions in the Indian archipelago. The insolence of Philip IV.'s minister, Olivarez, brought matters to a crisis, and in 1640, after a forced union of 160 years, Portugal was freed, by a bold and successful conspiracy of the nobles, from all connection with Spain, and the duke de Braganza, a descendant of the old royal family, placed on the throne, under the title of Joam IV. The war with Spain, which was the natural result of this act, terminated in 1668, when, by the treaty of Lisbon, the independence of Portugal was formally recognized by the Spanish government. For the next hundred years, Portugal vegetated in a state of inglorious apathy. Her ancient glory had departed never to return, the nation was steeped in ignorance and bigotry, and from having been one of the greatest maritime powers of Europe, the Portuguese were content with becoming a commercial dependent rather than ally of Great Britain. Under the reign of Joseph I., who died in 1777, the genius and resolution of the minister, Pombal (q.v.),

infused temporary vigor into the administration, and checked for a time the downward tendency of the national credit. Pombal's efforts to rouse the people from their sloth, and infuse vigor into the government, were frustrated by the accession of Joseph's daughter, Maria, who, with her uncle-husband, Pedro III., allowed things to fall back into their own channels. The mental alienation of Maria led, in 1709, to the nomination of a regency under her eldest son, Joam. This prince, who showed considerable capacity in early life, finding that he could not maintain even a shadow of independence on the outbreak of the war between Spain and France, threw himself wholly on the protection of England; and finally, when he learned that Napoleon had determined on the destruction of his dynasty, left Portugal in 1807, accompanied by all his family, and transferred the seat of his government to Rio Janeiro, the capital of Brazil. This act was immediately followed, on the part of the French, by the occupation and annexation of Portugal—a measure which gave rise to the peninsular war. The victory of Vimiera, gained by the combined English and Portuguese army in 1808, freed the land from its French assailants; and in 1810, on the death of queen Maria, the regent succeeded to the joint crowns of Portugal and Brazil. The continued residence of the new king, Joam VI., at Rio Janeiro, gave occasion to abuses and discontent, which resulted, in 1820, in the outbreak of a revolution at Lisbon, and the proclamation of a constitutional form of government in the place of the pre-existing absolutism. After a period of great national excitement and political disturbance, the differences between the sovereign and people were so far adjusted, that Joam agreed to and signed the constitution of Portugal, and ratified the independence of Brazil, which was to be governed by his son, Dom Pedro, while he himself retained only the title of emperor. On the death of Joam in 1826, Pedro IV., after organizing the government of Portugal on the model of the French charter, renounced the Portuguese crown in favor of his daughter, Doña Maria da Gloria, on condition of her marriage with her uncle, Dom Miguel. The latter, who, during the lifetime of Joam, had availed himself of every opportunity to thwart the more liberal policy of his father and brother, waited only for the embarkation of the English troops to break the oath which he had taken to maintain the constitution, and gathering round him all who were in favor of restoring the old order of things in Portugal, he was through their aid declared king by the cortes, which met in June, 1828. A period of indescribable confusion, misrule, and anarchy followed. The nobles, monks, and rabble ruled the land; 13,000 Portuguese citizens went into exile, while double that number of persons, suspected of favoring the constitutional party, were kept in confinement. At length, in 1832, Dom Pedro was enabled, chiefly by means of a loan from Englishmen, to raise a fleet, and make a landing at Oporto. Admiral Napier, in the meanwhile, operated on the coast of Algrave successfully in favor of the young queen, whose cause, by these victories, and the support of an alliance with the great powers, finally proved victorious. Doña Maria made her entry into Lisbon in 1833; and in the following year Dom Miguel signed the convention of Évora, by which he renounced all pretensions to the throne, and agreed to quit Portugal. The death of Dom Pedro in the same year, after he had effected several important reforms, proved a heavy misfortune to Portugal, which suffered severely from the mercenary rule of those who occupied places of trust about the person of the young queen. Her marriage, in 1835, with Augustus, duke of Leuchtenberg, his death at the end of a few months, and her second marriage, in 1836, with prince Ferdinand of Saxe-Coburg, were followed by grave political disturbances, which in course of time were aggravated by the personal avarice and want of good faith of those in whom the young queen placed her confidence. A branch of the democrats, known as the Septembrists, from the month in which they made their first decisive stand against the government, loudly demanded the abrogation of the charter promulgated by Dom Pedro (and known as the *carta de ley de 1826*), and the restoration of the constitution of 1820. This contest of the charters may be said to have continued through the entire reign of Doña Maria. The government was alternately in the hands of Septembrists and chartists, toward both of whom the queen acted with a degree of duplicity that frustrated every effort at an adjustment of the national disorders. Insurrections and counter-insurrections were of frequent occurrence; the troops were not to be depended on in moments of emergency; guerrilla bands scoured the country at will, and openly defied the queen's authority. The absolutists, or Miguelites, took advantage of the general disorder to produce a reaction in favor of the old church party. The financial embarrassments were complicated in the extreme; while the obstinacy of the nation in regard to the maintenance of the slave-trade, in defiance of treaties and pledges, brought them into temporary collision with Great Britain, the only ally on whom Doña Maria could rely. An armed intervention of the great powers in 1847 produced a partial abatement of the national disorders; and matters might have permanently improved, had not the queen's partiality for her unpopular ministers, count Thomar and his brother Cabral, and her determination to leave the administration of affairs in their hands, exasperated the general discontent and distrust of the court, and led to the insurrection, which, without bloodshed, made the national idol, the marquis de Saldanha, *de facto* military dictator of Portugal, and evoked a general expression of the popular wish for the queen's abdication. Saldanha's ministry, although begun under good auspices, soon manifested the same readiness to succumb to the views of the court which had charac-

terized former ministries. One cortes was dissolved after another, and finally, in 1852, the government declared itself prepared to carry out necessary reforms without the concurrence of the cortes, and to demand at a future period a bill of indemnity for its acts. At this crisis the queen died suddenly, and her eldest son ascended the throne in 1853, as Pedro V., under the regency of the king-consort, his father. The latter used his power discreetly; and, by his judicious management, the financial disorders were partially adjusted. Upon the sudden death in 1861 of Pedro, his brother was proclaimed king as Luis I. He has steadily adhered to constitutional principles, and aims at the internal improvement of the country; and, in spite of frequent ministerial crises, and continual financial difficulties, the resources of the country are developing. When the insurrection of gen. Prim broke out in Spain, the Portuguese chambers declared unanimously against any proposals for an "Iberian union."

PORTUGUESE LANGUAGE AND LITERATURE. The Portuguese, like every other branch of the Romance family of languages, has grown out of a local form of the *Lingua Romana Rustica*, which in course of time had ingrafted upon it many elements of Arabic from the Saracen invaders of the country, and numerous verbal and idiomatic characteristics of the Frankish and Celtic dialects, which were introduced with the Burgundian founders of the Portuguese monarchy. The earlier forms of Portuguese bore close affinity with the Galician, and although, in course of time, it presented strong resemblance to its sister language, the Castilian, in as far as both possessed numerous words of identical origin, it differed so widely from the latter in regard to grammatical structure, as almost to merit the designation of an original tongue. The antipathy existing between the Portuguese and Spaniards, and the consequent strenuous efforts of their best writers to keep their language distinct, and to resist the introduction of further Castilian elements, had the effect of making Portuguese still more dissimilar from the sister tongues of the peninsula, and the result is the production of a language differing from pure Spanish in having an excess of nasal sounds, and fewer gutturals, with a softening or lipping of the consonants, and a deepening of the vowels, which renders it the softest, but least harmonious, and the feeblest of all the Romance tongues. The earliest specimens of genuine Portuguese belong to the beginning of the 13th c., and consist for the most part of collections, or books of songs (*Cancioneiros*), which, both in regard to form and rhythm, resembled the troubadour or *minne* songs of the same period. Of these, the oldest is the *Cancioneiro del Rei Dom Diniz*, or Book of Songs, by king Diniz, who had long been regarded by the Portuguese as their earliest poet, but whose poems were supposed to be lost, till they were discovered about 40 years since, in MS. in the library of the Vatican, and published at Paris and Lisbon in 1847. In the 14th and 15th c., the court continued to be the center of poetry and art, as it had been under Diniz; but Castilian was in greater vogue than Portuguese, which was despised by the numerous royal poets, who emulated the example of Diniz, and composed love-songs and moral or didactic poems. Under the culture of these noble bards, the poetry of Portugal remained weak and effeminate, without acquiring even the tenderness and pathos which characterized the Spanish romances of that age. The poetry and literature of Portugal acquired new vigor with the growth of her maritime and commercial glory, and the *Cancioneiro Geral* (Lisb. 1516) of the poet Garcia de Resende, which gives a general summary and extracts of all the Portuguese poets of the latter half of the 15th, and beginning of the 16th c., affords evidence of this improvement, which is most strongly exemplified in the sentimental pastorals or romances, and the national eclogues of Bernardino Ribeiro and Sá de Miranda, whose eclogues and prose dramatic imitations of Plautus and Terence, mark the transition period between the mediæval lyrical and the later classical style. These first attempts at the drama were followed by Antonio Ferreira, whose *Ines de Castro* is the oldest Portuguese tragedy. But the classical school, whose chief cultivators were the courtiers of Lisbon and the professors of Coimbra, found little favor among the people at large, for the discoveries and conquests of the nation in Asia, Africa, and America excited an enthusiasm and self-consciousness in the people, which led them to crave for something more practical and natural than the stilted style of the classicists. At this crisis, when Portugal was at the zenith of her material prosperity, appeared her greatest poet, Camoens, who, in his immortal epic, *Os Lusíadas*, which appeared in 1572, struck out a new path in the domain of epic poetry; while his numerous sonnets, 300 in number, his *Canções* or songs, his *Redondillas*, dramas, and other poetic productions, exhibit a versatility of genius and graceful tenderness which place him in the foremost rank of European poets.

With Camoens and his contemporary, Gil Vicente, the language and poetry of Portugal reached the culminating point of their development. During the dominion of Spain, the Portuguese so far lost all feeling of national independence and patriotism, that they at length renounced their native tongue, and adopted the language of their foreign rulers. With the restoration of political independence, under the sway of the Portuguese house of Braganza, a reaction took place; but the 17th and 18th c. produced few Portuguese writers who attained more than an ephemeral and purely local reputation—bombast, or slavish imitation of Spanish and Italian writers, being the predominant characteristics of the Portuguese school of light literature. Some good historical writers belong, however, to this period, as Jacinto Freire de Andrade, whose life of

João de Castro, viceroy of India, still holds its place as the most perfect monument of classical prose; the great Indian missionary, the Jesuit father Antonio Vierra, who died in 1699, and whose sermons and letters—of which a collection was published at Lisbon in 1748, and at Paris in 1838—are regarded by his countrymen as models of style and diction; F. X. da Meneses, the author of *O Portugal Restaurado* (1741), etc. In the beginning of the present century, Portuguese poetry was partially redeemed from its previous low grade by two men, who, although they professed to observe a strictly classical style, possessed a delicacy of taste, and a genial creative power, which saved them from falling into the absurdities that had generally characterized the school in Portugal. The elder of these, F. M. do Nascimento, who died in exile at Paris in 1819, although specially noted as an elegant lyricist, deserves notice for his gracefully written miscellaneous papers; while Manoel de Bocage, his less cultivated rival and contemporary, must undoubtedly be regarded as the most original and truly national of the modern poets of Portugal. His sonnets rank as the finest in the language, and these, with his numerous idylls, epigrams, and occasional poems, composed in various styles and modes of versification, have had a host of imitators, among the best of whom are the dramatist J. B. Gomes, J. M. da Costa e Silva; the satirist, T. da Almeida; and the Brazilian, Antonio Caldas, distinguished for his sacred epics, and various imitations of Milton and Klopstock. The best of the recent Portuguese poets are M. de Albuquerque, A. de Castilho, and A. de Carvalho, and J. B. d'Almeida Garrett. The last-named, whose collected poetic and prose works appeared at Lisbon in 1840, was at once the most versatile and popular writer of his time in Portugal. In the departments of travels, geography, and history, Portugal has produced good writers from the earliest periods of its literary history; and in recent times, the works of B. Machado, J. Ferreira, and A. de Cajo, have well maintained the national reputation.—Portuguese literature is also cultivated in Brazil, and, of late years, with more success than in the parent country. The principal names in Brazilian poetry are Gonçalves Diaz, Macedo Abreu, and Magalhães; in history, Varnhagen, author of the *Historia General de Brazil* (1854), and P. da Silva, author of the *Brazilian Plutarch*; besides some divines, philosophers, and translators from the classics.

PORTUGUESE MAN-OF-WAR (Jelly-fish). See *ACALEPHÆ*, *ante*.

PORTUGUESE WINES. Many varieties of the grape are cultivated in Portugal, and the wines produced are very numerous. From the Douro district, a mountainous tract near Oporto, port wine is derived. The first pipe of port is said to have been shipped in the year 1678. During the ten years following 600 pipes were shipped each year. In 70 years the annual exportation rose to 17,000 pipes. In 1757 the monopoly of the wine company was established, and continued to the year 1833, when it was abolished. During these 77 years the annual exportations amounted to 33,300 pipes. A new company was established in 1843, but abolished in 1867. A large percentage of brandy is generally added to port wine, because it is the quickest and most certain means of making the wine marketable and salable to the consumer. The principal vines grown in the Douro are the *Verdeilho*, *Mourisco*, *Bastardo*, *Abarilhao*, *Touriga*, *Tinta Francesca*, and the *Tinta Cua*. The wine is exported principally to Great Britain, the annual value amounting to over £1,000,000 sterling. In 1877 that country imported 4,069,555 gallons, costing £1,328,552. The wines known as *Palmella* and *Inglezinhos* are grown in the neighborhood of Lisbon. Of Portuguese white wines may be mentioned those of *Lisbon*, *Burcellas*, *Carcavellos*, *Arinto*, *Termo*, and *Setuval*; of the red variety are *Lavrado*, *Lamego*, *Torres Vedras*, *Monção*, and *Colares*. See *PORT WINE*, *ante*.

PORTULACÆÆ, or PORTULACACEÆ, a natural order of exogenous plants, nearly allied to *caryophyllaceæ*, from which it differs chiefly in the generally perigynous stamens, the calyx consisting of two sepals which are united at the base, and the capsule frequently opening transversely. The species are not very numerous; they are much diffused over the world, and are shrubby or herbaceous, generally succulent, mostly growing in dry places. The flowers are often large and beautiful, but ephemeral. The foliage is bland and insipid. Some species are used as salads and pot-herbs, of which the best known is purslane (q.v.). The tuberous roots of *Claytonia tuberosa*, a Siberian plant, are used for food, as are those of the mellico (*mellica tuberosa* or *ullucus tuberosus*), a Peruvian plant, sometimes referred to this order. The genus *calendrina* furnishes some beautiful annuals.

PORT WINE (i.e., *Porto* or *Oporto wine*), a species of red wine, hot and heady, which is produced chiefly in a mountainous district of Portugal, called Cima de Douro, and exported from Oporto and Lisbon. The vine from which this wine is produced is generally planted on craggy slopes with a southern exposure. The grapes are gathered from the commencement of September to the middle of October. The cultivation and gathering of the grapes for port wine employ annually 10,000 cultivators and 20,000 gatherers. The wine, when pure and unadulterated (which is very seldom the case), does not acquire its full strength and flavor till it has stood for some years, but care must likewise be taken that it is not allowed to become too old. The color of new port wine varies from pale rose to deep red, and changes with age, becoming a deep tawny brown, which is permanent. By far the greater portion of the wine made is mixed with

spirit even during the time of fermentation, in order to give the new wine the ripeness and strength which exporters require, and which the wine does not naturally attain till it has stood for some time; the proper color is also given by an ingredient known as *jeropiga*, which is a preparation of elderberries, molasses, raisin-juice, and spirit. It is an excess of this *jeropiga* in the inferior sorts of port which communicates to them the medicated odor so frequently noticed. The extreme "headiness" of port is chiefly due to the liberal admixture with spirit, and this is the case with all the sorts generally exported. From the time when port came into demand (about 1700, though it was known in England for a considerable time before this) down to 1826, its export was a monopoly in the hands of the English merchants, and the amount of wine produced increased, with tolerable steadiness, year after year till 1836, when it reached 38,459 pipes, valued at £1,122,500. The ultimate effect of this monopoly was to increase the price of port wine in England, and at the same time so to deteriorate its quality, that in course of time it became of less demand, and was gradually, to some extent, supplanted by southern French and other wines. Since 1836 it has fluctuated, being sometimes more and sometimes less than this figure; in 1850 the exportation reached 37,487 pipes, of which 25,400 were sent to Great Britain. In 1875 the quantity of wine imported into Great Britain from Portugal was 35,500 pipes; value, £1,492,761.

PORUS, KING, in the time of Alexander the great, ruled over northern India, near the Hydaspes river. When Alexander invaded his country, he prepared to defend the passage of the stream; but the Grecian general crossed some distance above the Indian camp, and surprised and defeated successively Porus's son and the king himself. The captive monarch conducted himself with great dignity, and won the regard of Alexander, who treated him with much generosity.

PORY, JOHN, b. England, about 1570; d. previous to 1635; entered Gonvil and Caius college 1587, made a translation of the *Geographical History of Africa* by John Leo, a Moor, called the only original authority for the state of n. and central Africa of that period; republished in Purchas's *Pilgrimes*. He was living in Paris in 1612, and 1619-21 was secretary to the colony at Jamestown, Va. On his return voyage to England he stopped at Plymouth, and visited the colony then recently arrived. He assisted Hakluyt in the preparation of his geography, and in 1623 came back as a commissioner from the privy council.

POSCHAREVATZ. See PASSAROWITZ.

POSEIDON. See NEPTUNE.

POSEN, a province of Prussia, bounded n. by Pomerania and east Prussia, e. by Poland, s. by Silesia, and w. by Brandenburg and Pomerania. Area 11,150 sq. m. Pop. at the close of 1875, 1,608,956. It is divided into the two governmental districts of Posen and Bromberg; and the principal towns are Posen, Bromberg, Lissa, Rawitsch, and Gnesen. The principal river is the Wartha, which traverses Posen from e. to w., and is navigable throughout the greater part of its course, as is also the smaller Netze. The country is almost everywhere level, and its surface extensively covered with bogs, ponds, and small lakes. The soil is on the whole fruitful, and the numerous swamps and forests which covered the land during its annexation to Poland have of late years been converted into rich meadow and good arable land, where cattle of superior quality are raised, and good crops of wheat, barley, oats, and flax are procured. The forests are extensive and productive, and contribute largely to the exports of the province, of which, however, the most important articles are corn, wool, tallow, hides, wax, and honey. With the exception of coal, which is obtained from beds near the town of Wronki, Posen has no mineral products. Good broad-cloth, linens, and lace are manufactured in many of the small country towns. Since the annexation of Posen to Prussia much has been done to supply the previous deficiency in regard to popular instruction; and there are now nine gymnasia, several normal and training schools, a seminary for priests, and upward of 2,000 burgher and national schools. The greater part of the population belongs to the Roman Catholic church, which is under the spiritual jurisdiction of the archbishop of Posen and Gnesen, while 74,000 of the remainder are Jews. The inhabitants may still be said to be Poles, more than 800,000 persons employing Polish as their mother-tongue. Posen formed an integral part of Poland till 1772, when, at the first partition of the Polish territory, the districts n. of the Netze were given to Prussia. At the second and third partitions, which were made twenty years later, the remainder was incorporated in the Prussian kingdom under the name of South Prussia. In 1807 Posen was included in the duchy of Warsaw; but by the act of the congress of Vienna it was separated in 1815 from Poland, and reassigned to Prussia under the title of the grand duchy of Posen. In 1848 the Poles, who had never amalgamated with their new German compatriots, took advantage of the general political excitement of that period to organize an open rebellion, which gave the Prussian government considerable trouble, and was not put down till much blood had been spilt on both sides. On the cessation of disturbances the German citizens of the province demanded the incorporation of Posen with these Prussian states which were members of the German confederation, and the Berlin chambers gave their approval of the proposed measure in 1850: but on the subsidence of revolutionary sentiment in Germany the subject was dropped.

POSEN (Polish *Poznan*), the chief t. of the province of Posen, and a Prussian fortress of the first rank, is situated on the low and sandy banks of the Wartha, nearly 150 m. e. of Berlin. Pop. '71, 56,374; '75, 60,998—of whom not quite the half are Protestants, and toward 10,000 are Jews. Posen, which ranks as one of the most ancient cities of Poland, became the seat of a Christian bishop in the 10th century. Till 1296 it was the seat of the Polish dukes; and it was a member of the Hanseatic league during the middle ages, when it was an important trading mart between western Europe and the Slavonic lands bordering on Asia. At this time many German, English, and Scottish traders settled in Posen, which latterly fell into decay. It passed into the possession of Prussia in 1815. At the great fire of 1803, when many of the older parts of the town were destroyed, Posen lost the most striking features of its semi-oriental style of architecture; but it still retains a certain picturesque character from the number of its church towers and lofty houses. Among its fifteen principal churches the most noteworthy are the cathedral, a recently restored and elaborately ornamented building, and St. Stanislaus, a splendid specimen of Italian architecture. Posen, which has been strongly fortified since 1828, is encircled by six suburbs. It is the see of an archbishop, the seat of the provincial government, and has a fine town-hall, two gymnasia, a public library with 20,000 volumes, training-schools for teachers of both sexes, a school for midwives, a theater, etc. Recent restorations and improvements have rendered it one of the pleasantest-looking towns in Prussia, and it can now boast of many fine regularly-built streets and squares, in which are situated the winter residences of many of the provincial Polish nobles. A considerable trade in wood, corn, wool, broadcloth, and linen is carried on here, principally by the Jews, and the annual fairs held in summer attract large crowds from all parts of the province. The chief manufactures of Posen are cloth, leather, carriages, copper vats and other vessels used in distilling, and tobacco; while there are likewise several breweries, distilleries, and sugar-refineries.

POSES PLASTIQUES (Fr. "statuesque attitudes"), equivalent to tableaux vivants (q.v.).

POSEY, a co. in extreme s.w. Indiana, drained by the Wabash and Ohio rivers, which divide it from Illinois and Kentucky; traversed by the Kentucky and South-eastern railroad; 430 sq. m.; pop. '80, 20,857—18,968 of American birth. The surface is hilly, but the bottom lands are very rich; tobacco, corn, wheat, oats, and grass are the chief products. There are factories making carriages, plows, and other agricultural tools. Co. seat, Vernon.

POSEY, THOMAS, 1750—1818; b. Va.; settled in West Virginia in 1769. He became a quartermaster in lord Dunmore's army, and was engaged in the battle with the Indians at Point Pleasant in Oct., 1774. The next year he assisted in the defeat of Dunmore at Gwyn's island. He afterward joined Morgan's riflemen, and fought with a force of British light infantry at Piscataway, N. J. Entering the army under Gates, he was at the battles of Bemis heights and Stillwater in 1777, and the same year conducted an expedition against the Indians. In 1779 he commanded a battalion under Wayne, and was prominent at the assault on Stony Point. He served with Wayne till the evacuation of Savannah, and was at the surrender of Cornwallis. He was appointed brig. gen. in 1793, and removing to Kentucky, was state senator, lieut. gov., and maj. gen. of militia. He was U. S. senator from Louisiana, 1812—13, gov. of the Indian territory, 1813—16, when he became commissioner of Indian affairs.

POSITONIUS, b. Syria, b. c. 2d c.; came to Rome in the consulship of Marcus Marcellus, b. c. 51, and died, according to Lucian, at the age of 84. He was a pupil of Panætius, whom he succeeded as the leader of the stoics; and was the teacher of Cicero, who frequently speaks of him with praise. Pompey visited him b. c. 67, at Rhodes, where the greater part of his life was passed, and again b. c. 62, after the close of the Mithridatic war; and Posidonius wrote a history of the wars of Pompey. Besides his philosophical works, he wrote treatises on history, astronomy, and geography, none of which are extant, with the exception of their titles, and the quotations from them preserved by Cicero, Strabo, and others. He wrote *Meteorologica*, and Cicero alludes to his artificial sphere, which represented the motion of the heavens. He traveled much for the purpose of collecting information for his works, and Plutarch has taken from him the materials of several of the "lives," notably that of Caius Marius, whom Posidonius personally knew. He was a stricter stoic than Panætius, and maintained that pain was not an evil.

POSILIPPO, a mountain on the n.w. of Naples, close by the city, remarkable for the tunnel known as the Grotta di Posilipo, through which the road from Naples to Pozzuoli (anc. *Puteoli*) passes. The grotto is in some places 70 ft. high, and 21 ft. wide, and is 2,244 ft. long. It is very ancient. Seneca mentions it as the *Crypta Neapolitana*. Strabo assigns its construction to M. Cocceius Nerva, superintendent of aqueducts in the time of the emperor Tiberius. Above the eastern archway of the grotto is the so-called "tomb of Virgil." At the base of the hill of Posilipo anciently stood the poet's villa, in which he composed the *Ecloques* and *Georgics*, if not also the *Aeneid*. During the middle ages, the common people firmly believed the grotto to be the work of the poet, whom they regarded as a great magician.

POSITIVE PHILOSOPHY. See COMTE.

POSITIVE PRINTING, in photography. This term is used to designate that process by which impressions from a negative (q.v.) are produced upon suitably prepared paper. The term, however, does not belong exclusively to positives produced on paper, and intended to be viewed by reflected light, since transparent positives for examination by transmitted light are produced on glass. The means by which this kind of positives is obtained are so exactly similar to the dry negative collodion process, that a detailed notice thereof is hardly necessary in the present article, which will be confined exclusively to the means of obtaining positive proofs on paper.

Regarding, then, the negative, not so much a picture as the means of producing one, the first thing which presents itself for notice is the paper. This may be either German or French, known in the markets under the respective names of saxe and rive. They are used in the simply salted condition, or more generally in the salted and albuminized state, the purpose of the albuminizing being to prevent the chemicals used in the process from sinking into the paper, whereby the delicate details of the negative would become defective on the surface. The process is briefly as follows: float the paper on the salting bath from one to five minutes; drain for one minute; hang up to dry. Float the paper on the exciting bath from five to ten minutes, according to its strength; drain, and hang up to dry. Expose in a pressure-frame under a negative. The necessary depth of impression being obtained (a point only to be determined by experience), wash the print in common water. Some operators at this stage immerse the print in a bath containing one per cent. of ammonia for two or three minutes. This is by no means absolutely necessary; should it, however, be done, it should be afterward washed in water for five or ten minutes; after which it is immersed in the toning bath from one to ten minutes, or until the desired *tono* be obtained; it is then washed in several changes of water, preparatory to immersion in the fixing bath. This last operation occupies from fifteen to thirty minutes, according to the strength of the fixing solution, and the depth to which the printing has been carried. The print is then copiously washed in *many* changes of water, and hung up to dry.

The *baths* referred to above are composed as follows: *salting bath*, water, one ounce; albumen, 4 ounces; good common salt, 48 grains. *Exciting bath*, nitrate of silver, 240 grains; water, 4 ounces; glacial acetic acid, half a dram. *Toning bath*, chloride of gold, 4 grains; water, 24 ounces; carbonate soda, 100 grains. *Fixing bath*, hyposulphite of soda, 4 ounces; water, 1 pint.

Printing in carbon, lamp-black, or other impalpable powder, which doubts as to the stability of silver prints had long made a *desideratum*, has recently been brought to a considerable degree of perfection. It is based on the discovery by Mungo Ponton, that a mixture of gelatine and bichromate of potass is rendered insoluble by the action of light, and on the experiments of Poitevin, Fargier and Blair. There are three typical processes—the *autotype*, *Woodburytype*, and *lichtdruck*. The *autotype* consists in coating a sheet of prepared paper with a mixture of gelatine, bichromate of potass, and carbon, and when dry, exposing it under a negative. On removal from the printing frame, the pigment is moistened with water, and laid, prepared side down, on a support of glass, zinc, or shellac-coated paper, to which a gentle pressure makes it adhere. The paper is then removed, and the print is developed by immersion in warm water, which dissolves the unaltered gelatine, but cannot touch the parts rendered insoluble by the light which has passed through the negative. The developed print is again transferred to paper, when the high lights are found to consist of those parts where the gelatine has been completely dissolved, the middle tints of the parts less soluble, and the shadows of the parts quite insoluble.—In the *Woodburytype*, a bichromated gelatine film, but without carbon, is prepared, exposed, and developed in a somewhat similar way, but dried without being transferred to paper, the result being a sheet of gelatine with a picture in *relief*. This is laid on a plate of soft metal, and covered with a plate of steel, and the whole subjected to the action of a hydraulic press, by which the soft metal takes the impression of the gelatine film. In printing from the plate so produced, an ink, consisting of carbon and gelatine, is poured on the center, the paper is laid on the ink, and the pressure of a suitable press applied, whereby the ink is squeezed into the shadows and half-tones, and the high lights are left clean, the result being a really fine print. Glass may be used instead of paper, with very fine results.—*Lichtdruck* is a method of printing photographs in an ordinary lithographic press, with printer's ink, from gelatine films prepared on the same principle as the *Woodburytype*, except that the soluble gelatine is not washed away. The film is attached to a thick plate of glass fixed in the press, and when sponged over, the soluble parts absorb water, and so are prevented from taking on ink, while the insoluble portions remain dry, and the ink adheres to them.

POSITIVISM, a scheme of philosophy founded by Auguste Comte, which limits speculation and knowledge to observed facts, with their constant antecedents, accompaniments, and consequences. It ignores all laws except those of manifest association; and excludes causes and effects, supernatural and spiritual agencies, hidden forces and immaterial essences. It reduces the intelligible universe to mere phenomena, refusing to search into the essential constitution of things, or to advance beyond the sphere of strictly scientific analysis and construction. It claims thus to pursue purely inductive science, and regards all beyond as not only uncertain but delusive. The system is thus

defined by Frederick Harrison, one of its eminent advocates: "By the positive method of thought we mean that which would base life and conduct, as well as knowledge, upon evidence that can be referred to logical canons of *proof*, which would place all that occupies man in a homogeneous system of *law*. On the other hand it turns aside from *hypotheses* that cannot be tested by any logical canon familiar to science; and from ideal standards which profess to transcend the field of law. We say, life and conduct shall stand for us wholly on a basis of law, and must rest entirely in that region of science (not physical, but moral and social science) where we are free to use our intelligence in methods which the intellect can analyze." To this may be added the original description of the system by Comte himself: "In fine, in the positive state the human mind, recognizing the impossibility of attaining absolute notions, renounces the investigation of the origin and destination of the universe, and inquiry into the intrinsic causes of phenomena, and attaches itself instead solely to the discovery, by judicious combination of reasoning and observation, of their invariable relations of succession and resemblance. The explication of facts thus reduced to its real terms is, thenceforward, nothing more than the connection established between the diverse phenomena and certain general facts whose number is constantly diminished by the progress of science." Notwithstanding the apparent originality imparted to the system by its modern dress and forms of thought, acute thinkers detect in it a revival of the old dogma that man is the measure of the universe. The ancient connection between the macrocosm and microcosm is repeated by limiting the intelligible universe to the image that the human mind can obtain by reasoning on the phenomena that the bodily senses observe. The boundless universe, and the mind, heart, and duty of man, are narrowed down to the mere knowledge of visible things. "The combined activity of the human powers, organized around the highest of them," it calls "the soul." Sir David Brewster criticises it as "an extravagant transformation of that rational empiricism which professes to take experience for its basis, resulting from insisting on the prerogatives of experience in reference to external phenomena, and ignoring them in relation to the movements and tendencies of our intellectual nature." See COMTE, *ante*.

POSSE COMITATUS means the whole force of the county, consisting of knights and men above the age of 15, with constables, who attend the orders of the sheriff to assist in enforcing process or quelling riots. Justices of the peace can also, if apprehensive of an organized resistance, command the services of the posse comitatus, and it is the sheriff's duty to raise the necessary number of men. But practically, in modern times, constables and special constables are all the assistance given or required.

POSSESSION OF PROPERTY, in point of law, is the most intimate relation that can subsist between the owner and his property. Strictly speaking, the idea of property consists merely of a certain relation between a human being and a portion of external nature, whereby he appropriates to himself all the ordinary uses of which such external nature is capable. If it is land, he reaps the fruits, and excludes all other persons from interfering with his operations; if it is a chattel, he keeps it under his exclusive control. Possession, therefore, is nothing but the legal result of the relation of property. Possession, though originally constituting the whole substance of property, has, as civilization advanced, become a separable part of it; and while the radical right is now the ownership, the possession is viewed as an incident of such ownership. It is now not only separable but salable, and constitutes the foundation of the contract between landlord and tenant, whereby the owner, by way of a lease, sells for a limited period the exclusive use, otherwise called the possession. So long, therefore, as an owner exists, he has, as a necessary consequence, the right, more or less immediately and directly, to the possession of property. When all record of ownership is lost, then the law permits a resort to first principles, and allows any person who has been in possession for a limited time to retain it, and so ultimately acquire the ownership. If the possession is suddenly or wrongfully interfered with, the usual remedy, in England, to recover possession of real property, such as land or houses, is an action of ejectment; if the property is a chattel, it is an action of trover or detinue. But the possession may be recovered also by other modes. See also OWNERSHIP and LOST PROPERTY.

POSSET, a dietetic preparation, made by curdling milk with some acidulous liquor, such as wine, ale, or vinegar. White wine or sherry is usually preferred, but sometimes old ale is used. The milk is boiled; and whilst it is still on the fire, the acidulous matter is added; if sherry, about a wine-glassful and a half to the pint of new milk is the proportion; or twice the quantity if ale. A teaspoonful of vinegar or of lemon-juice is sometimes used instead; one or two tablespoonfuls of treacle are added, to sweeten. Taken at bedtime, it is used for colds and coughs.

POST, ALFRED CHARLES, LL.D.; b. New York, 1806; graduated at Columbia college in 1822; appointed in 1851 professor of surgery in the medical department of the university of New York, and attending and consulting surgeon to various hospitals and institutions in New York, which positions he retains.

POST, TRUMAN MARCELLUS, D.D., b. Vt., 1810; graduated at Middlebury college in 1829; was principal of an academy at Castleton, Vt., 1829-30; tutor at Middlebury college 1830-32; settled at Jacksonville, Ill., and admitted to the bar in 1833; became professor

of languages in Illinois college, and afterward, of history; was ordained and installed pastor of the Congregational church of Jacksonville in 1840; in 1847 became pastor of the Third Presbyterian church at St. Louis, and in 1851, of the First Congregational church of that city, where he remains. He has officiated as professor of history in the Washington university of St. Louis, of church history in the theological seminary at Chicago, and lecturer on Congregationalism in the seminary at Andover. He is the author of *The Skeptical Era in Modern History*, has published sermons, pamphlets, and addresses, and contributed to various periodicals. All his work shows scholarship, spiritual fervor, and intellectual breadth.

POST, WRIGHT, 1766-1828; b. Long Island, N. Y.; studied medicine for six years in New York and London; practiced medicine in New York in 1786; became in 1793 professor of surgery, and afterward of anatomy and physiology in Columbia college; visited the celebrated schools of Europe, and returned in 1793 with a splendid anatomical cabinet; became in 1813 professor of anatomy in the college of physicians and surgeons, and its president 1821-26. He was for 30 years consulting physician of the New York hospital, and a member of the prominent literary societies of the city.

POSTAL SERVICE. See POST-OFFICE.

POST-CAPTAIN, an obsolete title applied to captains in the royal navy: it has been disused for many years. See CAPTAIN.

POSTE RESTANTE (Fr., to remain at the post-office till called for), a usual mode of addressing letters to persons who are merely traveling in, or passing through, a country in which they have no fixed residence. English travelers on the continent have very generally their letters so addressed to some town through which they expect to pass. The *poste-restante* office is open at certain hours, and the letters are given out when called for, production of a card, passport, or other evidence of identity being sometimes required. Letters unclaimed for a certain time are opened, and either destroyed or returned to their writer. There is a *poste-restante* office in London, under stringent regulations as to the conditions on which letters are given out. If the applicant for a letter be a British subject, or subject of a state not issuing passports, he must state the place from which he expects letters, and he, or the messenger who applies for him, must be provided with some proof of identity. If he be the subject of a country which issues passports, his passport must be produced. In the provincial post-offices of Great Britain, commercial travelers, tourists, and persons without a settled residence may have their letters addressed *poste restante*, and they are kept at the post-office till called for; but residents are not allowed to have their letters so addressed, and the post-office authorities have orders to deliver them. In the British post-office, letters addressed *poste restante* are kept one month, and then returned to the writer through the dead-letter office.

POSTERN, in fortification, is a small doorway communicating usually through the flank of a bastion between the fort and the ditch. Its object is to afford unseen egress to troops marched out to relieve sentries on the external works, to make sallies, etc. The postern is often called the "sally-port."

POSTHUMOUS CHILD, one born after the father's death, or taken from the body of the mother after death. Such a child is regarded by the law as already born at the time of the parent's death, and when the father has made no provision in his will for the posthumous child, the will is so far revoked as to allow it to take the property or such portion as it would have been entitled to if it had been born before the father's death.

POSTING, the forwarding of passengers from place to place by means of relays of horses. The application of the same words—post and postmaster—to the transmission of letters and to the stations where post-horses are kept, is, both on the continent of Europe and in Britain, a source of ambiguity. Posting was long in Britain, as it is yet in most parts of the continent, a government monopoly. A statute of Edward VI. fixed the charges of posting at 1d. per mile in 1548. The post-office act of 1656 confirmed the monopoly of furnished post-horses for travelers in favor of the postmaster and his deputies; for a long time past, however, posting has been in the hands of private individuals. Post-chaises were first used in France, and introduced into England in the early part of last century. The payment is estimated per mile for each pair of horses, without regard to the number of persons conveyed; and a second pair of horses is charged at the same rate as the first.

Over the continent generally posting is managed by the state, which retains the monopoly of supplying post-horses, and usually of forwarding the mails and diligences. The prices are fixed by government, as well as the number of horses that may be employed, which is regulated by the weight and number of persons conveyed.

POSTIQUE, an ornament in sculpture, marble, etc., applied or added after the work is otherwise finished.

POST-NUPTIAL CONTRACT means, in Scotch law, an agreement, or, as it is called in England, a settlement, made between husband and wife after the marriage has taken place, with a view to affect the property of the parties, and generally to make provision for the wife and children. As a general rule, a post-nuptial settlement is not so effectual

as an ante-nuptial settlement in securing the rights of a wife, because in the former case the marriage is considered a valuable consideration in point of law, and puts it on the footing of a sale. Nevertheless, if the husband is quite solvent, he and his future creditors will be bound by the provisions of a post-nuptial contract. See HUSBAND AND WIFE.

POST-OBIT is a bond or security given by heirs and others entitled to reversionary interests, whereby, in consideration of a sum of money presently advanced, the debtor binds himself to pay a much larger sum after the death of some person, or of himself. Whenever, as is not unusual, the payment is uncertain, and depends on the obliger out-living somebody else, very high interest is required, or rather a very much larger sum is agreed to be repaid than what is advanced. These are generally usurious bargains; but the obligee or creditor can enforce payment of the full amount; though, if there is a gross case of inadequacy in the proportions amounting to fraud, a court of equity will interfere.

POST-OFFICE, a place for the reception of letters, and the management of the various departments connected with their dispatch and conveyance. The name originated in the posts (from Lat. *positum*, placed, fixed) placed at intervals along the roads of the Roman empire, where couriers were kept in readiness to bear dispatches and intelligence; but the posts of ancient times were never used for the conveyance of private correspondence. The first letter-post seems to have been established in the Hanse towns in the early part of the 13th century. A line of letter-posts followed, connecting Austria with Lombardy, in the reign of the emperor Maximilian, which are said to have been organized by the princes of Thurn and Taxis; and the representatives of the same house established another line of posts from Vienna to Brussels, connecting the most distant parts of the dominions of Charles V. This family continue to the present day to hold certain rights with regard to the German postal system, their posts being entirely distinct from those established by the crown, and sometimes in rivalry to them.

In England, in early times, both public and private letters were sent by messengers, who, in the reign of Henry III., wore the royal livery. They had to provide themselves with horses until the reign of Edward I., when posts were established where horses were to be had for hire. Edward IV., when engaged in war with Scotland, had dispatches conveyed to his camp with great speed by means of a system of relays of horses, which, however, fell into disuse on the restoration of peace. Camden mentions the office of "Master of the Postes" as existing in 1581, but the duties of that officer were probably connected exclusively with the supply of post-horses. The posts were meant for the conveyance of government dispatches alone, and it was only by degrees that permission was extended to private individuals to make use of them. A foreign post for the conveyance of letters between London and the continent seems to have been established by foreign merchants in the 15th c.; and certain disputes which arose between the Flemings and Italians, regarding the right of appointing a postmaster, and were referred to the privy-council, led to the institution of a "chief-postmaster," who should have charge both of the English and the foreign post. Thomas Randolph was the first chief postmaster of England. The first proper postal communication for private letters in England came into operation 100 years after the institution of the foreign post. The increased intercourse between the English and Scottish capitals, brought about by king James's accession, led to a great improvement in the system of horse-posts, but their services were still confined to the conveyance of government dispatches. That king, however, instituted a foreign post for letters going abroad from England, and conferred the office of postmaster of England for foreign parts on "Mathewe de Quester the elder, and Mathewe de Quester the younger." This appointment was considered by lord Stanhope, the English chief-postmaster, to interfere with his functions, and a dispute and law-plea between the heads of the two establishments was settled in 1632, after Charles I. had become king, by the retirement of lord Stanhope, and an assignment of their office by the De Questers, under royal sanction, to William Frizell and Thomas Witherings. In 1635 Witherings was authorized to run a post night and day between London and Edinburgh, "to go thither and back again in six days." Eight main postal lines throughout England were at the same time instituted, and the post was allowed to carry inland letters. Two years later, a monopoly of letter-carrying was established, which has been preserved in all the subsequent regulations of the post-office. The rates of postage were 2d. for a single letter for a distance less than 80 m., 4d. up to 140 m., 6d. for any longer distance in England, and 8d. to any place in Scotland. An attempt, in 1649, by the common council of London to set up a rival post-office for inland letters, was suppressed by the house of commons. A practice of farming the post-office revenues, which began in 1650, continued, as regards some of the by-posts, till the close of last century.

An important post-office statute was passed under the protectorate in 1656, and re-enacted by 12 Car. II. c. 35. It ruled that there should be one general post-office and one postmaster-general for England, who was to have the horsing of all through posts and persons riding post. A tariff was established for letters, English, Scotch, Irish, and foreign, and the only non-governmental posts allowed to continue were those of the universities and the Cinque ports.

In 1685 a penny-post was set up for the conveyance of letters and parcels between different parts of London and its suburbs. It was a private speculation, originating

with one Robert Murray, an upholsterer, and assigned by him to Mr. William Doewray. When its success became apparent, it was complained of by the duke of York, on whom the post-office revenues had been settled, as an encroachment on his rights; a decision of the court of king's bench adjudged it to be a part of the royal establishment, and it was thereupon annexed to the crown. In this way began the London district-post, which was improved and made a twopenny-post in 1801, and continued as a separate establishment from the general post down to 1854.

The first legislative enactment for a Scottish post-office was passed in 1695, prior to which time the posts out of Edinburgh had been very few and irregular. About 1700 the posts between the capitals were so frequently robbed near the borders, that acts were passed both by the parliament of England and that of Scotland, making robbery of the post punishable with death and confiscation. The post-office of Ireland is of later date than that of Scotland. In the time of Charles I., packets between Dublin and Chester, and between Milford-Haven and Waterford, conveyed government dispatches; and after the restoration, the rate of letter-postage between London and Dublin was fixed at 6d.

Act 3 Anne, c. 10, repealed the former post-office statutes, and put the establishment on a fresh basis. A general post-office was instituted in London for the whole British dominions, with chief offices in Edinburgh, Dublin, New York, and other places in the American colonies, and one in the Leeward islands. The whole was placed under the control of an officer appointed under the great seal, called the postmaster-general, who was empowered to appoint deputies for the chief offices. Rates higher than those formerly charged were settled for places in the British dominions, and also for letters to foreign parts. A survey of post roads was ordered for the ascertainment of distances. Letters brought from abroad by private ships were ordered to be handed over to the deputy-postmasters of the ports, who were to pay the master a penny for each letter. A complete reconstruction of the cross-post system was effected in 1720, by Ralph Allen, postmaster of Bath, to whom the lords of the treasury granted a lease of the cross-posts for life: at his death they came under the control of the postmaster-general. The rates of postage were further raised by act 1 Geo. III. c. 25, which also gives permission for the establishment of penny posts in other towns, as in London. The Edinburgh penny-post was instituted in 1766, by one Peter Williamson, a native of Aberdeen, whom the authorities induced to take a pension for the good-will of the concern, and merged it in the general establishment.

Mail-coaches owe their origin to Mr. John Palmer, manager of the Bath and Bristol theaters, who, in 1783, submitted to Mr. Pitt a scheme for the substitution of coaches, protected by armed guards, for the boys on horseback, who till then conveyed the mail. After much opposition from the post-office authorities, his plan was adopted, and Mr. Palmer, installed at the post-office as controller-general, succeeded in perfecting his system, greatly increasing the punctuality, speed, and security of the post, and adding largely to the post-office revenue.

In 1837 a plan of post-office reform was suggested by Mr. (afterward sir) Rowland Hill, the adoption of which has not only immensely increased the utility of the post-office, but changed its whole administration. Its principal features were the adoption of a uniform and low rate of postage, a charge by weight, and prepayment. The change met with much opposition from the post-office authorities, but was eventually carried by a majority of 100 in the house of commons, becoming law by 3 and 4 Vic. c. 96. The new-system came into full operation on Jan. 10, 1840. Previously to the change, members of parliament had the right of sending their letters free, but this privilege of franking was entirely abolished. A penny was adopted as the uniform rate for every inland letter not above half an ounce. Facilities for prepayment were afforded by the introduction of postage-stamps, and double postage was levied on letters not prepaid. Arrangements were made for the registration of letters; and the money-order office, by a reduction of the commission charged for orders, became available to an extent which it had never been before. As far back as 1792 a money-order office had been established as a medium for sailors and soldiers to transmit their savings, and its benefit had afterward been extended to the general public; but the commission charged had been so high that it was only employed to a very limited extent. The immediate result of the changes introduced in 1840 was an enormous increase in the amount of correspondence, arising in part from the cessation of the illicit traffic in letters, which had so largely prevailed before; but for some years there was a deficit in the post-office revenue. The reduction of postage-rates was, however, a reduction of taxation, and if the exchequer lost revenue from one source, it gained it in other ways.

With the development of the railway system came the carriage of letters by train instead of by mail-coaches; and one novelty which arose out of this change was the adoption of traveling post-offices, forming part of the mail-train, where letters are arranged during transit, and which sometimes receive and drop the letter-bags while the train is going at full speed. The conveyance of the mails by railroad added greatly to the expenses of the post-office establishment; but, nevertheless, the former gross revenue of the post-office was exceeded in 1851, and the net revenue in 1863. According to the annual report of the postmaster-general for 1876, there are 896 head post-offices in the United Kingdom, 12,551 branch offices or receiving-houses, and about 10,724 road or pillar letter-boxes; making more than 24,000 receptacles for letters—at least 19,000 more

than existed under the former system. Above 1058 millions of letters passed through the post-office in 1878—more than twice as many as in 1861, and thirteen times as many as in 1839, the last year of the dear postage. In 1878 the gross revenue of the post-office, exclusive of that yielded by the telegraphs, was £6,047,312; the expenditure, also excluding the telegraphic service, £3,990,620; the net revenue, £2,052,793. The number of money orders transmitted within the United Kingdom, in 1877, was 18,890,692; the amount of money transmitted being £28,474,607.

The postal service of the three kingdoms is now under the immediate control of the postmaster-general, assisted by the general secretary of the post-office in London. There are also chief officers in Edinburgh and Dublin, with secretarial and other departmental staffs. The postmaster-general is a member of the privy council, and sometimes a cabinet minister. He has a salary of £2,500, and is the only officer connected with the department who leaves office on a change of government. The secretary is his responsible adviser, and has a salary of £2,000. The receiver and accountant-general keeps account of the money received by each department, receiving remittances from branch and provincial offices, and taking charge of the payment of all salaries, pensions, and items of current expenditure. The surveyors are the connecting link between the metropolitan and provincial officers, each postmaster, with some exceptions, being under the superintendence of the surveyor of his district. In 1878 the staff of officers employed in the post-office, including those engaged in telegraph work, was 45,947; of this number, 11,473 were engaged solely in telegraph work, and 10,635 were employed in London alone.

Act 24 Vict. c. 19 instituted a system of savings-banks in connection with the post-office. This department keeps a separate account for every depositor, acknowledges the receipt of every deposit, and on the requisite notice being furnished, sends out warrants authorizing postmasters to pay withdrawals. The rate of interest payable to depositors is $2\frac{1}{2}$ per cent, calculated on complete pounds and complete months, being a halfpenny per pound per month. Each depositor receives a savings-bank book, which is sent by him yearly for examination at the head-office, and the accruing interest is calculated and allowed. The number of depositors at the end of 1878 was 1,892,176; the sum at their credit, £30,411,563; and the accrued interest since 1861, £5,937,033.

Act 27 and 28 Vict. c. 43 empowers the postmaster-general to insure the lives of applicants for not less than £20 or more than £100, and also to grant immediate or deferred annuities on the lives of applicants aged ten or upward. See POST-OFFICE INSURANCE. Licenses are issued by the post-office on behalf of the board of inland revenue.

Half-penny post-cards were introduced in 1870, and in the first year 75 millions were used. The number delivered in 1878 reached 162 millions.

Act 31 and 32 Vict. c. 100 empowered the post-office to acquire the existing electric telegraphs; and the telegraphic communication of the country is now in the hands of the post-office. Above 22 millions of telegraphic messages were sent in the year ending Mar. 31, 1878. Gross revenue, £1,333,542; working expenses, £1,164,131; net revenue, £169,411.

The home and foreign mail-packet service was, in the 17th and 18th centuries, in the hands of the post-office authorities, but was removed to the board of admiralty, under whose control it remained till 1860, when it was again restored to the post-office. Steam-vessels were first used for conveying the mail in 1821; and in 1833, mail-contracts were introduced, the first being with the Mona Steam company to run steamers from Liverpool to Douglas in the Isle of Man. Of the home mail-packet contracts, the most important are those with the City of Dublin Steam-packet company for conveying the Irish mails between Holyhead and Kingstown. The principal foreign contracts are for the Indian and Chinese mails, entered into with the Peninsular and Oriental Steam-navigation company, the mails to North and South America, the West Indies, the Australian colonies, and the Cape.

The post-office statute of queen Ann contains a prohibition, repeated in subsequent acts, for any person employed in the post-office to open or detain a letter, except under a warrant from one of the principal secretaries of state. During last century, such warrants were often granted on very trivial pretences. In 1723 at bishop Atterbury's trial, copies of his letters, intercepted at the post-office, were produced in evidence against him; and in 1735 it appeared that an organization existed, at an immense expense, for the examination of home and foreign correspondence. In 1782 the correspondence of lord Temple, when lord-lieutenant of Ireland, was subjected to a system of post-office espionage. In the beginning of the present century, an improvement took place in this matter, and lord Spencer introduced the custom, in 1806, of recording the dates of all warrants granted for the opening of letters, and the grounds on which they were issued. Since 1823 the warrants have been preserved at the home office; and a house of commons' return in 1853 shows that, in the preceding ten years, only six letters were detained and opened—four in cases of felony, and two that they might be properly returned by those who claimed them. One of these cases of interference with the privacy of correspondence occurred in 1844, when sir James Graham, as home secretary, issued a warrant for opening the letters of Mazzini, and caused certain information contained in them to be conveyed to the Austrian minister, an act which involved the ministry of the day in considerable

popular obloquy, and produced a widespread, though very groundless, distrust of the security of the ordinary correspondence of the country. See GRAHAM, SIR JAMES.

The following is a summary of the most important regulations of the British post-office, reference being made for the minute details to the *British Postal Guide*:

Inland Letters.—The rates of postage, prepaid, are 1d. for a letter weighing not more than 1 oz.; 1½d. when the weight is 1 oz. and not above 2 oz.; 2d. 2 oz. and not above 4 oz.; 2½d. 4 oz. and not above 6 oz.; 3d. 6 oz. and not above 8 oz.; 3½d. 8 oz. and not above 10 oz.; 4d. 10 oz. and not above 12 oz. A letter exceeding 12 oz. is charged 1d. per oz.; e.g., for a letter weighing 16 oz. the postage is 16d. A letter posted unpaid is charged double postage. Letters insufficiently stamped are charged double the deficiency on delivery. Redirected letters are charged additional postage at the prepaid rate; and this may either be prepaid, or charged on delivery. Letters for officers, soldiers, or seamen on actual service abroad are redirected without charge. The same privilege extends—with several restrictions—to soldiers' and sailors' letters redirected from any part of the United Kingdom.

No inland letter can be conveyed by post which is more than 1 foot 6 in. in length, 9 in. in width, and 6 in. in depth, unless sent to or from one of the government offices.

Registration.—The registration fee of 2d.—in addition to the ordinary postage—prepaid in stamps, secures careful treatment to any letter, newspaper, or book-packet, and renders its transmission more secure, by enabling it to be traced from its receipt to its delivery. Letters may be registered for a fee of 2d. to any place in the British colonies, and for various rates of charge to different foreign countries. Letters containing coin, if not registered, are treated as if they were, and charged on delivery with a registration fee of eightpence; the same fee is charged on letters marked "Registered" and posted in the usual way instead of being given to a post-office servant. If lost, the contents are only made good to the extent of £2.

Foreign and Colonial Letters.—For the rates payable, reference is made to the *British Postal Guide*. Prepayment must be wholly in stamps. In some cases prepayment is optional; in others, compulsory; and to some countries the whole postage cannot be prepaid. A letter posted unpaid or partially paid, directed to go by a route by which prepayment is compulsory, is returned to the writer, unless there be another route to send it by, by which prepayment is not required. Letters, however, for Australia and New Zealand, if prepaid as much as one rate, are forwarded, charged with the deficient postage and an additional rate. Letters for the Cape or Natal posted unpaid (wholly or in part), in addition to the deficient postage are charged 6d. each. Those for St. Helena and British West Indies, not included in the general postal union, are charged 1s. each in addition to the deficient postage. No letter for any foreign country may be above 2 ft. in length or one foot in width or depth.

Letters to be sent by private ship must be so marked; their postage varies from 2½d. upward for half an ounce, and prepayment is obligatory in some cases, and in others not.

Letters to passengers on board the American or Mediterranean packets must be registered, and must be addressed to the care of the commander of the packet.

The post-office monopoly is applicable to *letters* only, and it does not include letters sent specially by private messenger, or letters concerning goods or merchandise sent to be delivered along with the goods which they concern.

Newspapers.—In 1870 the impressed duty stamp was abolished; and now, any newspaper published at intervals not exceeding seven days, and on a sheet or sheets unstitched, and registered at the general post-office, is transmissible by post within the United Kingdom at a postage of one half-penny for each transmission. The postage must be prepaid, either by an adhesive stamp or by a stamped wrapper. A packet of newspapers is not chargeable at a higher rate than a book packet—namely, one half-penny for every 2 oz. or fraction of 2 oz. The cover, if there is one, must be open at both ends, and such that the packet can be easily removed for examination. There must be no writing outside or inside, except the address of the person to whom the newspaper is sent. Registration for inland circulation includes registration for transmission abroad. Newspapers for foreign countries and the colonies are subject to the same general regulations as for inland circulation, except that they may be published at intervals of 31 days, and printed on sheets stitched together. They must be posted within 8 days from the day of publication.

Parliamentary Proceedings.—The printed proceedings of parliament, with the words "parliamentary proceedings" written or printed on the cover, may circulate throughout the United Kingdom at the rate of one half-penny for every 2 oz. or fraction of 2 oz. Prepayment is optional. Parliamentary notices may be forwarded by post under certain regulations and restrictions, the postage chargeable, and a registration fee of 6d. being payable in stamps.

Book-post.—This branch of the post-office was first established in 1848, and further improved by regulations issued in 1855, '57, and '70. The postage is now one half-penny for every 2 oz. or fraction of that weight. A book-packet may contain books, paper, or parchment, whether plain, or written, or printed upon (provided there be nothing of the nature of a *letter*); maps, prints, etc. (but not in glass frames). *Circulars,*

when wholly or in great part printed or lithographed, may also be sent by book-post, singly or in packets. The postage must be prepaid by adhesive stamps, or by a stamped wrapper; if not prepaid the packet is charged double the book-postage; if not sufficiently prepaid it will be charged double the deficiency. If there is a cover it must be open at the ends. No book-packet must exceed 5 lbs. in weight; it must not be over 1 foot 6 in. length by 9 in. in width and 6 in. in depth; nor must it contain anything sealed against inspection. An entry on the first page of the book stating who sends it, or to whom it is given, is allowed. In order to secure the return of book-packets that cannot be delivered, it is recommended to have the names and addresses of the senders written or printed outside. No writing in the way of a letter or communication is allowed; if any such communication be found within a packet the whole will be charged the unpaid letter rate, and forwarded. The book-post has been extended to the colonies and to foreign countries at varying rates.

Colonial and Foreign Pattern and Sample Post.—This post extends to most colonies and foreign countries, at rates corresponding with those for book packets. It is restricted to *bonâ-fide trade patterns or samples of merchandise*. Goods sent for sale, or in execution of an order (however small the quantity may be), or any articles sent by one private party to another which are not actually patterns or samples, are not admissible. The patterns are to be sent in covers open at the ends or sides; but samples of articles which cannot be placed in open covers may be inclosed in transparent bags. Such articles as knives, scissors, etc., may be sent to places abroad, except France and the French colonies, provided they are so packed as to do no damage.

Post cards, bearing a half-penny impressed stamp, are transmissible within the United Kingdom. On the stamped side the address alone is to be written. On the other side any communication may be written or printed. Private cards are, in certain circumstances, allowed to be impressed with a half-penny stamp. Inland post-cards are issued in two qualities, "stout" and "thin," at 8d. and 7d. per dozen respectively. There are also foreign post-cards (price 1d. and 1½d.) for places within the postal union, used also for India, the French colonies, etc., on payment of a small additional charge.

Money Orders.—Inland money orders may be obtained at any of the post-offices of the United Kingdom, on payment of the following commission: For sums under 10s.—2d.; for 10s. and under £2—3d.; for £2 and under £3—4d.; for £3 and under £4—5d.; and so on, up to £9 and under £10—11d.; £10—1s. Money-orders may now be issued to the colonies, to most European countries, the United States, Egypt, etc., the commission being about three to four times the above rate. In applying for a money order the surname and initial, at least, of one Christian name of the sender, and the name of the person to whom payable, must be given; but the designation of a firm will suffice, and the name of the person to whom the order is payable may be withheld, if it is to be paid through a bank. A money order in the United Kingdom becomes void if not presented for payment before the end of the twelfth calendar month after that in which it was issued. Orders drawn on France or Italy must be paid within three months. As the lower rates for inland money orders entail a loss on each transaction, a parliamentary committee in 1877 recommended a revision of the scale, and the issue of "postal notes" for small fixed sums.

Any person with a fixed residence may have a private box at the post-office on paying an appointed fee; but in no other case can a resident have his letters addressed to the post-office. See *POSTE RESTANTE*.

Letters containing anything liable to injure the contents of the mail-bag are not allowed to be sent by post. This comprehends glass in any form, vessels containing liquids, meat, fruit, explosives, sharp instruments, etc.

Telegrams.—The charge for the transmission of messages by telegraph throughout the United Kingdom is 1s. for the first twenty words, and 3d. for each additional five words, or part of five words; the charge for five words or less to the Scilly Isles is 2s. 6d., plus the ordinary inland rate; each additional word being charged 6d.

The Universal Postal Union.—In Oct., 1874, a conference at Berne resulted in the establishment of the "general postal union," embracing all the European countries, with Egypt and the United States, and resulting in a great simplification of international postal arrangements. This was followed in June, 1878, by the treaty of Paris, signed or subsequently adhered to by all the parties to the former treaty, with the addition of British India, the colonies of France, Spain, Holland, and Portugal, various British colonies, Persia, Japan, Liberia, Brazil, Peru, Mexico, etc., the new convention receiving the name of the "universal postal union." Under this important treaty all the consenting nations were declared to be "a single postal territory for the reciprocal exchange of correspondence." Equal rates, weights, and rules are established, and considerable reduction of postage have followed its adoption. Except in the case of lengthly sea transit, a uniform rate of 25 centimes (2½d.) is adopted for a letter of 15 grams (½ oz.); of 10 centimes (1d.) for post cards; of 5 centimes (½d.) for packets of print, etc., of 50 grams (2 oz.); and of 25 centimes (2½d.) for registration in Europe, and 50 centimes (5d.) for registration beyond Europe.—See *Her Majesty's Mails*, by Lewins; the Postmaster-General's Annual Reports; *Almanach de Gotha*; *Martin's Statesman's Year Book*, etc.

POST-OFFICE (*ante*). Before 1639 postal facilities in the American colonies were simply those afforded by personal accommodation among the colonists. Parton's *Life of Franklin* gives the following account: "Letters arriving from beyond the sea were usually delivered on board the ship into the hands of the persons to whom they were addressed, every family sending a member on board for the purpose of receiving letters. Letters not called for were taken by the captain to a coffee-house near the wharf, where they lay spread out on a table waiting the coming of their owners. Persons from the adjacent settlements called at the coffee-house, and carried away not only their own letters, but all the letters belonging to people in the neighborhood, which they either delivered in person, or deposited at the house of the minister or magistrate, or some relative of the individual to whom the letter was addressed. Hence the custom grew of depositing at the ship coffee-house letters written in the town and destined to a place in the interior, as well as letters brought from the country and directed to an inhabitant of the town. As the settlements grew in number and magnitude it became usual to leave letters directed to one of them at the inn most frequented by the inhabitants of that settlement. Thus, several years before there was a post-office or a post-rider in the colonies, a rude, slow, unsafe, but neighborly system of letter-delivery had sprung up; and long after the establishment of a post-office, this neighborly method continued to be the main dependence of the people for the transportation of letters for short distances." In 1639 Massachusetts undertook the establishment of a legalized postal system, the general court issuing the following decree: "It is ordered, that notice be given that Richard Fairbanks, his house in Boston, is the place appointed for all letters which are brought from beyond the seas, or are to be sent thither, to be left with him; and he is to take care that they are to be delivered or sent according to the directions; and he is allowed for every letter a penny, and he must answer all miscarriages through his own neglect in this kind." In Virginia the colonial law of 1657 required every planter to provide a messenger to convey the dispatches, as they arrived, to the next plantation, and so on, on pain of forfeiting a hoghead of tobacco for default. In 1672 the government of New York established a monthly mail to Boston, advertising as follows: "Those that be disposed to send letters, are to bring them to the secretary's office, where in a locked box they shall be preserved till the messenger calls for them; all persons paying the post before the bagg be sealed up." Thirty years later the *Boston News Letter* published the following order, showing that this monthly post was then changed to a fortnightly one: "By order of the postmaster-general of North America. These are to give notice, that on Monday night the 6th of December, the Western Post between Boston and New York sets out once a fortnight, the three winter months of December, January, and February, and to go alternately from Boston to Saybrook and Hartford, to exchange the mail of letters with the New York Ryder the first turn for Saybrook, to meet the New York Ryder on Saturday night, the 11th current; and the second turn he sets out at Boston on Monday night the 20th current, to meet the New York Ryder at Hartford, on Saturday night the 25th current, to exchange mails; and all persons who send letters from Boston to Connecticut from and after the 13th instant, are hereby notified first to pay the postage on the same." In 1673 the general court of Massachusetts fixed the payment of messengers with the mails at threepence a mile; and in 1677 the same authority appointed "Mr. John Hayward, the Scriveper," to receive and distribute foreign letters on their arrival in Boston. Three years later this same John Hayward, or Haywood, was appointed postmaster for the whole colony. In July, 1683, William Penn issued an order for the establishment of a post-office in Pennsylvania. There was then a weekly mail from Philadelphia to Maryland, the postage being 6d. for each letter. In New Hampshire a post-office was established by the colony in 1693. In Maine, previous to the revolution, the mail to Portland from the west arrived but once a week, and was very irregular. It was not until about 1760 that a weekly mail was established further east than Portsmouth, N. H.; before that time it was sent only when a sufficient number of letters had collected to pay expenses. The first attempt to systematize and regulate postal communication in the colonies, on the part of the British government, was made by act of parliament in 1660. In 1692 the colony of Virginia passed an act which sets forth the fact that one Thomas Neale had been empowered, by letters-patent from William and Mary, to take charge of the postal business of the colonies, and which accepted this appointment for that colony; and in the following year the legislature of the province of New Hampshire passed an act also recognizing the official authority of the same person. The charges for postage were: "To and from Philadelphia, by the eastern part of New England beyond Boston, nineteen pence. To and from Philadelphia to Lewis (or Lewiston, Del.), Maryland, and Virginia, ninapence. To and from every place within 80 m. of Philadelphia, fourpence half-penny." To or from Philadelphia to Connecticut the charge was ninapence; Rhode Island, twelve pence; and Boston, fifteen pence. The office of postmaster-general for America was created in 1704. Until after 1704 there was no regular post further east than Boston, or further west than Philadelphia. Shortly after this date stage-coaches were established between Boston and New York, and Boston and Philadelphia; but no post-office was established in Virginia until 1732, nor did any postal revenue accrue to Great Britain from the colonies until 1753. In 1710 a general post-office was established

in London for all the British dominions under one director called a postmaster-general, who had letter-offices at Edinburgh, Dublin, New York, and other convenient places; the deputy postmaster-general for the colonies was to reside in New York. Under the reign of queen Anne, an act of parliament established the rates of postage for the colonies, and for forty years after this period there was very little perceptible improvement in the postal service. The post-roads were generally in bad condition; the riders, although at this time perfectly loyal, were not trustworthy; and the postmasters are represented as not having been much better. This is shown, too, by the fact that Andrew Bradford, who was postmaster of Philadelphia, and who printed the *Mercury*, used his power to keep Benjamin Franklin's paper, the *Pennsylvania Gazette*, out of the mails, in order that his own paper might obtain the most business.

No man in America was so identified with the interests of the colonial post-office as Benjamin Franklin. In 1737 he was appointed postmaster of Philadelphia. In 1753 he received, with William Hunter, a commission as deputy postmaster-general for the colonies. He immediately proceeded to systematize the department, and personally made a tour of inspection, in which he visited every post-office in the country except that of Charleston, S. C. After four years of his rule, the post-office yielded the salary of the postmasters, and a small revenue besides, and in 1774 a clear annual revenue of £3,090 to Great Britain. In 1753 the delivery of letters by the penny-post was begun, and also the practice of advertising letters remaining in the office in Philadelphia. In 1774 Franklin became obnoxious to the British government, on account of his connection with the petition for the removal of governor Hutchinson from Massachusetts, and on January 31st of that year he was dismissed from the deputy postmaster-generalship. By this time the patriotic movement which concluded in the revolution was in full tide, and so great was the feeling caused by Franklin's dismissal, that private arrangements were made for carrying letters, and after 1774 the American post-office never again contributed a farthing to the British treasury. In fact, in 1775 the colonies combined to establish their own post-offices and to pay the necessary officials; the congress of the confederation appointing a committee to devise a postal system, which went into effect July 26, 1775, when Benjamin Franklin was unanimously appointed postmaster-general, with a salary of \$1000 per annum. In 1772, one Hugh Finlay was sent by the British government on a special mission to examine and report upon the post-offices and post-roads of the colonies. He arrived in New York in April, 1773, and proceeded at once to Canada; and beginning his investigation at the last settlement on the banks of the Chaudiere, proceeded thence with Indian guides to the Kennebec river, and examined all the post-offices between "Falmouth and Casco Bay in the Province of Massachusetts, and Savannah in Georgia," beginning Sept. 13, 1773, and ending June 26, 1774. This, which was the last official examination of the colonies made by order of the British government, was duly reported by Finlay; the original MS. notes of his report came by accident into the hands of persons in the United States, and were purchased by the post-office department at Washington, in whose possession they are. During the period of the revolution the postage was paid in currency; but this depreciated so much in value that it was ordered that only specie should be received. In 1792 rates of postage were fixed which remained unaltered for nearly half a century.

In 1845 the entire mail in the United States amounted to 29,000,000 separate articles; in 1875 the number of articles (letters and transient matter) mailed in the city of Boston alone was 39,000,000. The entire expenditures of the post-office department from 1783 to 1833 amounted to \$34,700,000; revenue, \$36,400,000. During the year 1875 alone, the expenditures were \$33,611,000, and the revenue \$27,441,000. Up to 1851 the department was self-sustaining; but since that year the expenses have been annually greater than the receipts, except in one year during the war. During the fiscal year ending June 30, 1880, the domestic postal business of the United States was as follows:

Letters.....	866,593,572
Postal-cards.....	276,446,716
Newspapers to subscribers and news-agents.....	695,175,624
Magazines " " " ".....	53,472,276
Books, circulars, and other printed matter.....	300,845,480
Articles of merchandise.....	22,634,456
	2,215,168,124

There were at the same date in the service of the government 5,862 contractors for the transportation of the mails on public routes. There were 1857 special offices, each with a mail-carrier; 11,112 public routes in operation, of which 1118 were railroad routes, aggregating in length 343,888 m.; in annual cost, \$18,707,706. The number of employees in the post-office department was 419; postmasters, 42,989; contractors, 5,862; clerks in post-offices, 5,519; letter-carriers, 2,688; railway post-office clerks, 1206; route agents, 1252; mail-route messengers, 338; local agents, 150; special agents, 56; total, 60,479; an increase over 1879 of 3,635 persons. The total expenditures of the department during the fiscal year ending June 30, 1880, were \$36,542,803.68; the revenues were \$33,315,479.34; deficiency, \$3,227,324.34. The amount appropriated for service of the fiscal year 1879-80, including sums appropriated by special acts, was \$37,757,089.87; amount

expended, \$36,101,820.38; leaving an unexpended balance of appropriations of the year of \$1,655,269.49.

POSTAGE-STAMPS, STAMPED ENVELOPES, AND POSTAL-CARDS.

Ordinary postage-stamps issued.....	875,681,970	value,	\$22,414,928 00

Aggregating.....	1,367,397,047	"	\$32,087,342 46

During the year 866,593,572 letters were mailed in the United States, of which 3,057,141, or one in every 283, became "dead." Books, pamphlets, magazines, and illustrated newspapers, for which no owner can be found, are distributed among the charitable institutions of Washington. The number of letters and parcels registered during the year was 6,996,513, of which 5,251,118 were domestic letters, 448,656 domestic parcels of third and fourth-class matter, 249,722 letters to foreign countries, 8,247 packets of third and fourth-class matter to foreign countries, and 1,038,770 letters and parcels forwarded for the government, and by law exempt from the payment of registry fees. The amount of registry fees collected during the year was \$595,774.30. The number of domestic money-orders paid during the year was 7,213,607, amounting in value to \$99,516,702.46. The weight of the foreign (out-going) mail during the year was 1,453,601 pounds.

POST-OFFICE, OFFENSES AGAINST. Owing to the conspicuous part which the post-office plays in modern civilization, a small code of laws belongs to it, the substance of which is as follows: Every person employed by the post-office who steals a post-letter, is guilty of felony; and if it contain money or a valuable chattel, the punishment is increased. So whenever letters are stolen by strangers out of the custody of the post-office or its officers. The moment a letter is put into the post-office or delivered to the postmaster, the protection of the statutes commences. Many nice questions have, however, arisen as to the application of the rule to special circumstances, and as to what constitutes an employment by the post-office. Whoever steals, secretes, or destroys printed papers or newspapers sent by post, commits a misdemeanor. So if a letter-carrier delay the delivery willfully; or if an official messenger disclose or intercept a telegraphic message, or violate the rules on that point. Receivers of letters improperly taken or stolen from the post-office, are guilty of felony. By the 1st Vict. c. 33, s. 2, any person conveying otherwise than by post a letter not exempted from the exclusive privilege of the postmaster-general, incurs a penalty of £5 for every letter. This exclusive privilege of carrying letters extends to letters only, and not to printed books or newspapers. There are also exceptions to the general rule, that letters can only be sent by the post-office. Thus, one may send a letter by a private friend, and not by the post-office. So letters sent by messenger on purpose on the private affairs of the sender or receiver, commissions and legal writs, merchants' letters sent by vessels or along with goods, are excepted. But no

person is authorized to collect and send these excepted letters, though in the legal manner described, for this is doing the work of the post-office. Moreover, there are certain persons expressly prohibited from carrying letters even gratuitously, as common carriers, except the letters relate to goods in their carts or wagons; owners, masters, or commanders of ships, except such letters relate to goods on board; and passengers on board ships. Statutes and rules made thereunder secure the monopoly to the postmaster-general of sending telegraphic messages, and telegrams are put nearly on the footing of letters.

POST-OFFICE INSURANCE is a valuable addition to the many useful services which our postal establishment has been enabled to render within the last few years. Book-post, sample-post, money-orders, and postal savings-banks, all additions to the original letter-post and newspaper-post, have been found to work so satisfactorily, that the legislature has been encouraged to intrust to the same organization a new system of insuring lives and granting annuities—specially intended to foster provident habits among persons whose savings can be but small.

In 1853 an act of parliament made an improvement in the then existing state of insurance law, by facilitating the purchase of government annuities through the medium of the savings-banks; and in 1864 another statute gave a great extension to those portions of the system which had been found to work well, effecting at the same time alterations in those which had exhibited certain defects during eleven years' working. Great facilities are introduced by this act for securing annuities by small payments. Not only may the national debt commissioners employ the trustees of saving-banks to receive and pay the moneys, at a certain rate of remuneration; but the postmaster-general joins in the arrangement, acting as a medium between the public on the one hand and the commissioners on the other. Ample tables and regulations have been printed, for the guidance of the commissioners, the postmaster-general, and the local postmasters throughout the kingdom. On the completion of these tables and regulations in 1865, the practical working of the system began. The tables of the premiums to be charged for life-insurances, for immediate annuities, for deferred annuities, and for deferred monthly allowances, are sold by Messrs. Eyre and Spottiswoode, the government printers, for 5½d. (the cost of the paper and printing); but similar tables are kept for inspection at the local post-offices without charge.

In regard to insurance, distinct from annuities, persons of either sex may insure through the medium of the post-office. The limited ages are from 16 to 60, and the limited sums from £20 to £100. In order to afford every possible facility in the payment of the premium, minute calculations have been made of the exact sum to be paid at each installment, by yearly, quarterly, monthly, or fortnightly payments, and terminable or not at a particular age. In order that there may be some limit to the labor thus placed on the postal authorities, no periodical installment is made smaller than two shillings. No one life can be insured for less than £20 in the whole; but when a life has been insured for £20, further insurances may be effected on the same life from time to time, until the whole sum for which it is insured amounts to £100. The following is a tabulated example of nine different modes of paying the premium on one particular insurance, to suit the convenience of the insurer. A man in his 50th year may insure £100 to his survivors at his death:

	£	s.	d.
1. By a single payment of.....	43	3	7
2. By an annual payment for life of.....	2	6	7
3. By a quarterly " "	0	13	0
4. By a monthly " "	0	4	4
5. By a fortnightly " "	0	2	2
6. By an annual payment, until the insurer reaches 60 years, of.....	2	13	10
7. By a quarterly payment, until the insurer reaches 60 years, of.....	0	15	0
8. By a monthly payment, until the insurer reaches 60 years, of.....	0	5	0
9. By a fortnightly payment, until the insurer reaches 60 years, of.....	0	2	6

If an insurer who has duly paid all installments for five years, should desire, or be compelled by circumstances to withdraw from the engagement, a portion of the past premiums will be repaid to him—never less than one-third of the total amount.

In regard to immediate annuities, persons of either sex may purchase annuities of not more than £50, and for lives from 10 years old and upward. The premiums necessarily vary with sex, age, and amount. Thus, a man aged 65 can purchase an immediate annuity of £10, paid half-yearly, for £83 18s. 4d.; whereas, a woman of the same age would have to pay £103 16s. 8d. Two or more small annuities may be purchased for the same life, provided the total amount does not exceed £50. Any two persons may purchase an annuity on their joint lives, with or without continuance of the annuity to the survivor.

Deferred annuities form another element in the scheme. These annuities are very varied in kind, and the amount of premium depends on a great number of conditions—amount of annuity; age and sex of the person; length of term for which the annuity is deferred (that is, the number of years which are to pass before the commencement of the annuity); mode in which the premium is to be paid; and the condition whether or not

there is to be any return of purchase-money under certain contingencies. As examples, take the following: A man aged 30 may purchase a deferred annuity of £10, to commence on his reaching the age of 60, and due half-yearly, for one immediate payment of £21 3s. 4d., or an annual payment of £1 8s. 4d.; in the case of a woman, the immediate or total payment would be £32 8s. 4d., and the annual payment £1 17s. 6d. If the person on whose life the annuity is to depend should die before the annuity itself commences, all the premiums paid up to that date may be returned to his or her representatives, provided a contract to this effect is made in the first instance. The premiums are necessarily higher for such a contract. The four sums just mentioned, where past premiums are *not* returnable, would be raised respectively to £40 9s. 2d., £2 0s. 10d., £47 0s. 10d., and £2 7s. 6d., with the returnable clause included.

Many persons in humble life would prefer that the annuities due to them should come more frequently than half-yearly. To suit this class, a system of deferred monthly allowances is established. A man aged 30 may purchase a deferred allowance of £2 7s. 3d. per month, to commence when he reaches the age of 60, by a payment of 8s. per month, until he reaches that age; the same monthly payment by a woman would realize a monthly allowance of £1 16s. 7d. If the returnable clause (above noticed) is included in the contract, the man's monthly allowance would be £1 14s. 2d., and the woman's £1 9s. 4d., for the like payment of 8s. per month. In regard to married couples, a husband and wife may each be insured to the full amount of £100, and may each purchase an annuity of £50, or a monthly allowance of £4 3s. 4d.

Persons whose lives are insured, or to whom annuities are granted, through the post-office, have direct government security for the payment of the money at the proper time; and this is one of the many valuable features of the system. It is not necessary here to describe the exact routine of proceedings for making an insurance or purchasing an annuity; the postmasters whose post-offices have been raised to the rank of insurance offices, are fully instructed in the matter, and will give all requisite information to applicants. We may add, that the *British Postal Guide*, an authorized publication, issued quarterly at 6d., gives a considerable list of tables of premiums payable at various ages for various kinds of insurance and annuity.

POSTULATE. This word occurs in geometry, and signifies something that is *demanded*, and must be granted before the demonstrations of the science can be wrought out. The postulates of Euclid have reference to certain constructions indispensable to the reasoning. They are these three: "A straight line may be drawn from one point to another;" "A line already drawn may be produced;" and "A circle may be described from a given center, with a given radius." The object of laying down these in the shape of demands, is to fulfill one great condition of demonstrative science, which is, that nothing shall be proceeded on, in the course of the reasoning, without being explicitly stated at the outset. It has been noticed by critics that the three postulates of Euclid do not exhaust the demands actually made in the course of his demonstrations. Thus, in the 4th and 5th propositions, Book I., this postulate is assumed: "Any figure may be removed from place to place without alteration of form, and a plane figure may be turned round on the plane."

The postulate is something different from the axiom. An axiom is a general and fundamental principle, such as no one can deny, and serving as the ultimate foundation (in logic, the major premise) of deductive inferences; as, for example, "Things equal to the same thing are equal to one another." The postulate, in Euclid's sense, is a special accessory to the reasoning, different from the axioms.

But in philosophy, the postulate takes a much wider sweep, and expresses the most fundamental concessions implied in all reasoning, being pre-requisite in order to the establishment of the axioms themselves.

Thus, it is a postulate necessary to reasoning and discussion that a reasoner shall be consistent with himself—that he shall not affirm a thing one minute and deny it the next. The so-called laws of thought—identity, contradiction, and excluded middle—are so many forms of the postulate of consistency. These laws are tantamount to demanding that the same thing shall not be maintained in one form, and denied in another. If we say this room is hot, we must not, at the same time, say that it is not hot. So the ordinary law of the syllogism, "Whatever is true of all members of a class, is true of each," is not so much an axiom as a postulate of consistency; we must be prepared to repeat individually the statements that we have affirmed collectively.

The ultimate premises of all truth and reasoning may be put in the form of postulates, as follows: 1. Present consciousness must be admitted as a ground of certainty. "I am thirsty," "I hear a sound," as facts of present consciousness, are to be held as trustworthy in the highest degree, or as amounting to the highest certainty. 2. But present consciousness is not enough; it must further be conceded that past consciousness is a ground of certainty. Present consciousness does not amount to an experience of value for future purposes, unless taken with past. Now, although a remembrance that is long past is often uncertain, a recent remembrance must be pronounced absolutely certain, not less than a present consciousness. That "I was thirsty a short time ago," I must be certain of, in order to establish the induction, "that water quenches thirst." 3. It must further be conceded, that "What has been in the past, all circumstances

holding the same, will be in the future." That a thing has been, does not imply that it will be. We may admit that the sun has risen to-day, and rose yesterday, and so on, and without inconsistency, refuse to admit that it will rise to-morrow. People are generally well enough disposed to treat this as a certainty; indeed, there is a strong natural tendency of the mind to expect that the future will resemble the past, which, when corrected and regulated by experience, constitutes our belief in causation and the uniformity of nature. Still, a blind instinct is no guarantee for truth; and as the assertion of the future is a distinct position, it should be formally assumed in a separate postulate. However often a thing may have happened, we still make a leap, and, so to speak, incur a risk in venturing to predict its future recurrence. Our confidence no doubt increases with repetition, but nothing can obliterate the line between what *has been* and what *is to be*.

These three postulates of experience, coupled with the postulate of consistency, seem adequate as a basis of all the recognized axioms and truths of experience. In other words, the concession of them is enough to commit any one to the reception of all inductive and deductive evidence.

POSTULATION (Lat. "an asking"), in canon law, means a presentation or recommendation addressed to the superior, to whom the right of appointment to any dignity belongs, in favor of one who has not a strict title to the appointment. It is one of the forms of proposing to the pope persons nominated, but not, strictly speaking, elected, to a bishopric. It is also used in the case of elections in which the candidate, although regularly chosen by the electors, yet labors under some legal disability which involves the necessity of a dispensation. The presentation of candidates for the episcopacy, as it exists in the Roman Catholic church in Ireland, is called postulation.

POSTURES, the name given to the attitude observed in worship, whether private or public, but especially the latter. They are the natural expressions of the feeling which accompanies or characterizes the particular devotion in which they are employed, and are used by supplicants to man as well as to God. Four postures are found to have been used by the ancient Christians in their prayer—the standing, the kneeling, the bowing or inclined, and the prostrate. Of these the ordinary one was kneeling; but for it was substituted, during the Easter-time and on the Sundays, a standing posture, which was understood to symbolize the resurrection of our Lord. To this usage we find allusions as early as the time of Justin the martyr. In the paintings of the catacombs, and on the ancient enameled glasses found therein, the standing posture in prayer is accompanied by outstretched and upraised hands. The bowing posture was rather a special act of reverence accompanying a particular address or a particular part of an address than a sustained posture. It occurred at frequent intervals in the ancient liturgy, and is still used in the Roman mass as well as (even more profusely) in those of all the various rites, Greek, Syrian, Coptic, Armenian, and Russian. The prostrate posture was the attitude of the deepest humiliation, and was mainly used by the penitents (q. v.), especially in that grade of public penance which was known under the name of "prostration." It is also used still in the solemn ordination of subdeacons, deacons, and priests, as performed in the Roman Catholic church. The question as to the use of particular postures was a subject of much controversy between the Puritans and the church of England; and has recently been revived in the Presbyterian church of Scotland.

POTASH AND PEARL-ASH, in commerce. See **POTASSIUM**. The chief source of this important article in Britain is Canada, where it is derived from the vast quantities of wood cut down and burned in clearing the forest for culture, and also from the branches of the trees felled for timber. The ashes, mixed with a small quantity of quick-lime, are put into large wooden cisterns, and covered with water. The whole is well stirred up, and allowed to settle; the next day the clear liquor is drawn off and evaporated to dryness in iron pots, whence it is called *potash*. When a sufficient quantity is got to fill a cask of 5 cwt. it is fused at a red heat and poured into the cask. The mass when cold is colored gray externally, but when broken shows a pinkish tint internally. It is very deliquescent, and consequently the casks require to be nearly air-tight. In this state potash contains a large quantity of foreign materials, amounting to about 40 per cent, among which sulphur and carbonaceous matter predominate. This is the crude American potash of commerce. If it is calcined by a reverberatory furnace the sulphur is driven off, and the carbonaceous matter burned out; the carbonic acid, however, combines with the potash, and forms it into a carbonate. To form it into *pearl-ash* it is then broken up and dissolved in water in a wooden cistern, having a perforated bottom, covered with straw, through which it filters, and is afterward evaporated in flat-bottomed iron pans. As it approaches dryness it is stirred with iron rods, which break it up into round lumpy masses of a pearly-white color, and in this state it is the pearl-ash of commerce, and contains about 50 per cent of pure potassa. All land-plants yield potash when burned, and many in much greater proportions than the timber-trees of North America; but the circumstances in which the materials are obtained give an advantage to our colonial manufacturers, which hitherto has enabled them to compete with the whole world. The quantity imported annually of "pots" and "pearls," as they are technically called, reaches the value of nearly half a million sterling. See **POTASSIUM**.

POTASH-WATER. See AERATED WATERS.

POTASSIUM (symb. K, equiv. 39, sp. gr. 0.865) is one of the alkaline metals. The letter K is selected as its symbol, as being the first letter of *kali*, the Arabic word for potash, the letter P being preoccupied as the symbol for phosphorus. The following are the chief characters for this metal. It is of a bluish-white color, and presents a strong metallic luster. At 32° it is brittle, and has a crystalline fracture; at a somewhat higher temperature it is malleable; at 60° it is soft, and of the consistence of wax; at 130° it is completely liquid; and at a red heat it becomes converted into a beautiful green vapor. Its affinity for oxygen is so great that on exposure to the air it immediately becomes covered with a film of oxide. When heated it burns with a violet flame. Its intense affinity for oxygen is well shown by throwing it into water, on which, from its low specific gravity, it floats. The metal abstracts oxygen from the water and forms oxide of potassium (potash); while the liberated hydrogen carries off a small portion of the volatilized potassium, and, taking fire from the heat evolved by the energetic chemical action, burns with a brilliant violet flame. The experiment is a very beautiful one, the burning metal swimming about rapidly on the water, and finally disappearing with an explosion of steam, when the globule of melted potash becomes sufficiently cool to come in contact with the water. At an elevated temperature this metal removes oxygen from almost all bodies into the constitution of which that element enters; and in the laboratory it is often employed to remove any traces of oxygen from hydrocarbons, by distilling the latter with a small quantity of the metal. From the above facts it is obvious that potassium must always be kept in some fluid, such as purified rock-oil or naphtha, which contains no oxygen.

Potassium does not occur in the native state, and can only be obtained by the reduction of its oxide, potash. There are three principal modes of reduction, all of which deserve a brief special notice, either on historical grounds or for their practical value.

1. Davy, in 1807, decomposed a fragment of hydrate of potash, by the current of a strong voltaic battery, into potassium, which separated as globules at the negative pole, and oxygen, which was evolved at the positive pole. This mode of procuring potassium yields only very small quantities, and is expensive; but the experiment was most important one for the progress of chemistry, as showing for the first time that potash is not, as was previously supposed, a simple body.

2. Stimulated by Davy's discovery, Gay-Lussac and Thenard, in the following year (1808), succeeded in obtaining the metal by purely chemical means in greater abundance, by decomposing potash by means of metallic iron at a white heat. The oxygen of the potash combines with the iron, and the potassium in a gaseous form is condensed in a receiver filled with naphtha, and kept cool.

3. The method now usually adopted consists in the distillation of a mixture of carbonate of potash and charcoal at a white heat, in an iron retort. If proper proportions are taken, the mixture is wholly converted into carbonic oxide and potassium, as is shown in the equation:

Potassium forms two compounds with oxygen, viz., a protoxide, KO, which constitutes potash, and is strongly basic, and a teroxide, K₂O₃, which does not combine with acids, and of which it is unnecessary to say more than that it is a yellowish-brown substance, which is found when the metal is burned in an excess of oxygen gas.

Potash can be procured in the anhydrous form by oxidizing thin slices of the metal in air perfectly free from moisture or carbonic acid. It is white, very deliquescent, and caustic. When moistened with water, it becomes incandescent, and the water cannot be expelled by any degree of heat. A far more important substance is the *hydrate of potash* or *caustic potash* (KO, HO). This is commonly prepared by dissolving carbonate of potash in ten times its weight of water, and gradually adding to the boiling solution a quantity of slaked lime, equal in weight to half the carbonate of potash used. The resulting compounds are carbonate of lime, which falls as a precipitate, and hydrate of potash, which remains in solution; the changes being expressed by the equation:

The clear supernatant fluid is removed by decantation, or by means of a syphon, into a clean silver or iron basin, and is rapidly evaporated till it flows tranquilly like oil; it is then either cast into cylinders in metallic molds, or is poured upon a cold slab, and solidifies on cooling. It may also be obtained in acute rhombohedrons, if allowed to crystallize from a hot concentrated solution; the crystals containing four atoms of water. A solution of hydrate of potash being one of our most important chemical reagents, it is very essential that it should be obtained pure. When obtained in the method that

has been described, it is apt to be contaminated with carbonic, sulphuric, hydrochloric, and silicic acids, lime, alumina, oxides of iron, etc., any of which substances can be detected by the appropriate tests. Pure caustic potash is, however, perfectly soluble in alcohol, which does not dissolve any of the above-named impurities. Hence, by forming an alcoholic solution of potash, and by evaporating it in a silver vessel till the whole of the alcohol is expelled, we obtain this substance in a state of purity. Hydrated potash, on solidifying after fusion, occurs as a hard, grayish-white, opaque body, with a crystalline fracture, which may be readily again fused into a colorless oily fluid, but which only volatilizes at a very high temperature. It is soluble in about half its weight either of water or of alcohol, and rapidly absorbs both carbonic acid and moisture from the atmosphere. It acts as a powerful caustic, and quickly destroys both animal and vegetable tissues, and hence its solutions can only be filtered through pounded glass or sand. Its affinities are so powerful that few vessels are capable of resisting its influence. Its solution must be preserved in glass bottles, into the composition of which no oxide of lead enters, as it has the property of dissolving this oxide out of the glass. Vessels containing silica (porcelain, earthenware, etc.) are decomposed, and platinum itself is oxidized when heated in contact with it. The principal uses of this substance are thus briefly summed up by prof. Miller: "Potash decomposes the fixed oils, and converts them into soluble soaps; when fused with siliceous minerals, it displaces the bases, and combines with the silica, forming silicate of potash. Potash is extensively employed in the arts: to the soap-boiler and the glass-maker, it is indispensable; when combined with nitric acid, it enters largely into the manufacture of gunpowder; and, in greater or less quantity, it furnishes important aids to a variety of processes employed in the manufactures of the country. In the laboratory, potash is in constant use for absorbing acid gases, such as carbonic acid, and for separating the metallic oxides from solutions of their salts, since, owing to the powerful affinity of the alkali for acids, it readily decomposes the salts of all the metals which produce oxides insoluble in water."—*Elements of Chemistry*, 2d ed., vol. ii. p. 353.

The salts which potash forms with acids are for the most part readily soluble in water, and colorless, unless (as, for example, in permanganate of potash) the acid is colored. Most of them are crystallizable, and they all communicate a violet tint, characteristic of potash, to the flame of spirit of wine and to that of the blow-pipe. Many of them occur in the animal and vegetable kingdoms, and the ashes of plants contain them in large quantity. We shall now briefly notice the most important of these salts. *Carbonate of potash* (KO, CO_2) is obtained by burning plants in dry pits, dissolving the ashes in water, evaporating till the sulphates, chlorides, etc., separate in crystals, and then boiling the mother liquid to dryness in iron pots. See POTASH. The quantity of pure carbonate of potash contained in it is liable to great variation, and the process termed *alkalimetry* has been invented, with the view of rapidly determining the amount of this salt, on which the commercial value of the pearl-ash depends. Different plants furnish varying quantities of this salt, and the leaves and young shoots are the parts which furnish it most abundantly. The potash is, of course, obtained by the plants from the soil, which, when capable of supporting vegetable life, always contains that substance; and does not exist in the plants in the form of carbonate, but in union with various organic acids (such as acetic, malic, tartaric, and other acids), which, by incineration, become decomposed into carbonates. The purified carbonate of potash, employed in pharmacy and for chemical purposes, is prepared from the crude salt by adding an equal quantity of cold water, agitating, and filtering. By this means, all the less soluble foreign bodies are got rid of. The solution is then boiled down to a small bulk, and allowed to cool, when the carbonate separates in small crystals, containing 20 per cent of water, and represented by the formula $\text{KO}, \text{CO}_2 + 2\text{Aq}$. Carbonate of potash is extremely deliquescent, and is soluble in less than its own weight of water, but is insoluble in alcohol. It has an acrid, alkaline taste, and its reaction upon test-paper is strongly alkaline. It is a compound of great importance, both as a chemical re-agent, and as entering largely into the preparation of most of the other compounds of potash, and into the manufacture of soap and glass. *Bicarbonate of potash* ($\text{KO}, \text{CO}_2 + \text{HO}, \text{CO}_2$) is obtained in white rhombic prisms, by passing a current of carbonic acid gas through a strong solution of carbonate of potash. These crystals are permanent in the air, but are decomposed by heat; water and carbonic acid being evolved, and the simple carbonate left. This salt is much less soluble than the carbonate, requiring four parts of cold water for its solution, which is nearly neutral to test-paper, and has a much milder taste than the preceding salt. It is employed largely in medicine for making effervescent draughts. *Sulphate of potash* (formerly known as *sal-polycaeres*) is obtained by dissolving in water the acid residue of bisulphate of potash ($\text{KO}, \text{SO}_3 + \text{HO}, \text{SO}_3$) which is left in the retort in the preparation of nitric acid. This solution, on being neutralized with carbonate of potash, furnishes hard transparent crystals of this salt. From its extreme hardness, this salt is used in medicine (as, for example, in Dover's powder), for the purpose of finely comminuting vegetable matters. The *bisulphate of potash*, from which the preceding salt is obtained, is the *sal-enicum* of the older chemists. Except that it is occasionally employed as a flux, it is of no special importance. *Nitrate of potash* has been already described under the head NITER. *Chlorate of potash* (KO, ClO_3) occurs in white rhomboidal tablets of a pearly luster. It has a cooling taste like that of niter. It fuses at a gentle heat without

decomposition; but on increasing the heat, it gradually gives off all its oxygen, and is converted into chloride of potassium, according to the equation :

It is not very soluble, as it requires for its solution 16 parts of cold and 1.7 parts of boiling water. It even exceeds nitrate of potash as an oxidizing agent; and if combustible substances, such as carbon, sulphur, or phosphorus be heated, or forcibly rubbed with it, a detonation or explosion occurs. This salt is employed in the manufacture of lucifer-matches, in certain operations in calico-printing, and for filling the friction-tubes employed for firing cannon, the best mixture for these tubes consisting of 2 parts of this salt, 2 of sulphide of antimony, and 1 of powdered glass. A mixture known as *white gunpowder*, consisting of chlorate of potash, dried ferro-cyanide of potassium, and sugar, has been employed for blasting purposes; but its preparation is accompanied by so much danger that it is seldom used. This salt does not occur as a natural product, but may be obtained by passing a current of chlorine gas through a hot solution of caustic potash; 6 eq. of chlorine combining with 6 eq. of potash to form 5 eq. of chloride of potassium, and 1 eq. of chlorate of potash, according to the equation: $6\text{Cl} + 6(\text{KO},\text{HO}) = 5\text{KCl} + \text{KO,ClO}_3 + 6\text{HO}$. The two salts are easily separated by crystallization, as the chlorate is comparatively insoluble, and the chloride extremely soluble. *Hypochlorite of potash* (KO,ClO) can only be obtained in solution. Under the title of *eau de Javelle*, it is sold as a bleaching agent. It is obtained by passing chlorine gas through a cold dilute solution of carbonate of potash, when chloride of potassium and hypochlorite of potash are formed, from which the chloride may be removed by crystallization. The *phosphates of potash*, formed by the different varieties of phosphoric acid, are sufficiently noticed in the articles PHOSPHATES (in physiology) and PHOSPHATES. The *silicates of potash* are important compounds in connection with the manufacture of glass; they also enter into the composition of Fuch's *water-glass*, or *soluble glass*, and have been employed by Ransome and others as a coating by which the decay of magnesian and other limestones may be prevented. The *chromate and bichromate of potash* are sufficiently noticed in the article CHROMIUM. The haloid salts of potassium may be passed over very briefly. The *chloride of potassium* (KCl) is obtained in large quantity in the preparation of chlorate of potash, or may be procured by burning potassium in chlorine gas, when the result of the brilliant combustion which takes place is this salt. In its general characters, it closely resembles common salt (NaCl), except that the former communicates a violet, and the latter a yellow tint to the flame of alcohol. It is a constituent of sea-water, of salt marshes, and of many animal and vegetable fluids and tissues. The *bromide and iodide of potassium* are sufficiently noticed in the articles BROMINE and IODINE. *Fluoride of potassium* (KF) possesses the property of corroding glass. There are no less than five *sulphides of potassium*, commencing with the photo-sulphide (KS), and terminating with the penta-sulphide (KS_5). The latter is the main ingredient in the *hepar sulphuris*, or *liver of sulphur*, used in medicine. It is a brown substance, obtained by fusing, at a temperature not exceeding 482° , 3 eq. of potash and 12 eq. of sulphur, the resulting compounds being 2 eq. of penta-sulphide of potassium (2KS_5), and 1 eq. of hyposulphite of potash ($\text{KO,S}_2\text{O}_3$). From this mixture, the penta-sulphide may be removed by alcohol, in which it dissolves. The *yellow and the red prussiate* (or the *ferro-cyanide* and *ferrid-cyanide*) of potash are noticed in the articles FERRO-CYANOGEN and FERRID-CYANOGEN. The *cyanide of potassium* (KCy) may be procured by heating potassium in cyanogen gas, when brilliant combustion occurs, and the resulting product is this salt. It may, however, be more cheaply and easily prepared by Liebig's process, which does not, however, yield it pure, but mixed with cyanate of potash—an impurity which is of no consequence for most of the applications of cyanide of potassium, as, for example, electro-plating and gilding. Eight parts of anhydrous ferro-cyanide of potassium are mixed with three parts of dry carbonate of potash; the mixture is thrown into a red-hot earthen crucible, and kept in fusion till carbonic acid gas ceases to be developed, and the fluid portion of the mass becomes colorless. After a few moments' rest, the clear fused salt is decanted from the heavy black sediment, which consists chiefly of metallic iron in a state of minute division. It has recently been derived from an unexpected source. In some of the iron furnaces where raw coal is used for fuel in the hot-blast, a saline-looking substance is sometimes observed to issue in a fused state from the tweer-holes of the furnace, and to congregate on the outside. Dr. Clark of Aberdeen has shown that this substance is mainly cyanide of potassium. This salt forms colorless deliquescent crystals, very soluble in water. It exhales an odor of hydrocyanic acid, and is said to be as poisonous as that acid. Its great deoxidizing power at a high temperature renders it a valuable agent in many of the finer operations of metallurgy.

The following are the ordinary tests for the potassium compounds: 1. Solution of tartaric acid added in excess to a moderately strong solution of a potassium salt, gives after some time a white crystalline precipitate of cream-of-tartar. See TARTARIC ACID. The result is hastened by stirring or shaking. 2. Solution of bichloride of platinum gives a crystalline yellow precipitate, which is a double salt of bichloride of platinum and chloride of potassium. If not previously acid, the mixture to be tested should be acidulated with hydrochloric acid. See PLATINUM. 3. The violet tint occurring in the

presence of potassium in the outer flame of the blow-pipe, or in the flame of spirit, has been already noticed. 4. The spectrum of a flame containing potassium exhibits a characteristic bright line at the extreme limit of the red, and another one at the opposite violet limit of the spectrum. See SPECTRUM ANALYSIS.

The British Pharmacopœia contains the following preparations of this metal: *Caustic potash*, or *hydrate of potash* (KO, HO), which occurs in hard white pencils. From its being fused before being poured into the molds which give it the form of pencils, it is often termed *potassa fusa*. From its power of dissolving the animal tissues, it is sometimes used as a caustic, although its great deliquescence renders it somewhat difficult to localize its action to the desired spot. In bites of venomous serpents, mad dogs, etc., it may be applied with advantage, and it is useful in destroying warts and fungoid growths of various kinds. It can be employed with greater safety than the lancet in opening certain abscesses, especially those of the liver. *Solution of potash*, commonly known as *liquor potassæ*, is obtained by the process already given for the preparation of hydrate of potash—namely, by the action of slaked lime on a boiling solution of carbonate of potash. Its sp. gr. is 1.058, and hence the solution is somewhat weaker than that of the London pharmacopœia, whose sp. gr. is 1.063, and which, according to the experiments of Mr. Phillips, contains 6.7 grains of potash in 100 grains of the solution. "One fluid-ounce requires, for neutralization, 48.25 measures of the volumetric solution of oxalic acid." *Liquor potassæ*, in combination with a tonic infusion, is of service in cases of dyspepsia which are accompanied with excessive acidity of the stomach, such, for example, as often occur in habitual spirit-drinkers. It is also frequently given with the view of rendering the urine alkaline, or of diminishing its acidity in cases in which that secretion is too acid. In chronic skin-diseases, especially those of a scaly nature, it often gives relief, if given in full doses, and for a sufficient time; and in chronic bronchitis it is given with advantage for the purpose of diminishing the viscosity of the bronchial mucus. The usual dose is ten drops, gradually increased to as much as a fluid dram. Infusion of orange-peel and table-beer are fluids which conceal its unpleasant taste. Veal-broth has also been recommended as a medicine in which to present it. Its too prolonged use renders the urine alkaline and sedimentary (from the deposit of phosphate of lime), and tends to impoverish the blood. *Sulphurated potash*, or *potassa sulphurata*—which is the new name for the sulphuret of potassium, or liver of sulphur (*hepar sulphuris*)—is obtained by fusing together carbonate of potash and sublimed sulphur. It occurs in solid greenish masses, which are liver-brown when recently broken. It is alkaline and acid to the taste, readily forming with water a yellow solution, which has the odor of sulphureted hydrogen, and evolving that gas freely, on the addition of an excess of hydrochloric acid. It is sometimes given internally in doses of three grains (in the form of a pill made with soap), in obstinate skin-diseases; but is chiefly used as a lotion, bath, or ointment for these diseases. It must be recollected that this compound is an energetic narcotico-acrid poison, its action being very like that of sulphureted hydrogen. *Acetate of potash* ($\text{KO}, \text{C}_4\text{H}_3\text{O}_2$) is obtained by the action of acetic acid on carbonate of potash, and occurs in white foliaceous satiny masses. In its passage through the system it is converted into carbonate, and thus renders the urine alkaline. In small doses, as from a scruple to a dram, it acts as a diuretic, and is of service in some forms of dropsy. Combined with other potass-salts, it is much given in acute rheumatism. *Carbonate of potash* ($\text{KO}, \text{CO}_2 + 2\text{Aq}$) is employed in medicine in the same cases as those in which solution of potash is used. In large doses it acts, like caustic potash, as an irritant poison. It is frequently employed in the preparation of effervescing draughts, 20 grains of this salt being neutralized by 17 grains of citric acid, or 18 grains of tartaric acid, or by half a fluid-ounce of lemon-juice. *Bicarbonate of potash* ($\text{KO}, \text{HO}, 2\text{CO}_2$) may be used in the same cases as the carbonate or solution of potash. It is chiefly used for the manufacture of effervescing draughts, 20 grains of the crystallized salt being neutralized by 14 of citric acid, 15 of tartaric acid, and $3\frac{1}{2}$ drams of lemon-juice. *Chlorate of potash* (KO, ClO_3) is prescribed with advantage in diseases of a low type, such as scarlatina maligna, cancerum oris, diphtheria, scurvy, etc. As it is eliminated unchanged by the kidneys, its *modus operandi* is unknown. It may be prescribed in doses of from 10 to 20 grains three times a day in solution. *Citrate of potash* ($3\text{KO}, \text{C}_12\text{H}_5\text{O}_{11}$) is obtained by neutralizing a solution of citric acid with carbonate of potash, filtering and evaporating to dryness, when the salt is deposited as a white powder of a saline, feebly-acid taste, deliquescent, and very soluble in water. It is procured *extempore* in a state of solution in the effervescing draughts for which we have given prescriptions in our remarks on the carbonates of potash. It acts mildly on the skin, bowels, and kidneys, whose secretions it promotes, and is an excellent cooling diaphoretic in fevers with a hot and dry skin, being less liable to act on the bowels than the tartrate or acetate of potash. In irritability of the stomach, it is an excellent remedy, when given as an effervescing draught. It may be taken in doses of a scruple or half a dram in solution every few hours. The therapeutic uses of *nitrate of potash* are noticed in the article NITRE. *Sulphate of potash* (KO, SO_3) is useful as a mild laxative, a scruple of this salt, especially if combined with ten grains of rhubarb, usually acting mildly and efficiently. It has considerable power in repressing the secretion of milk, and has been much used for this purpose.

The uses of the *tartrates of potash* are noticed in the article TARTARIC ACID. *Bromide*

of *potassium* (KBr) occurs in white, transparent, cubical crystals, and is occasionally employed in enlargement of the spleen and in certain forms of epilepsy. The uses of *iodide of potassium* are described in the article IODINE.

POTA'TO, *Solanum tuberosum* (see SOLANUM), one of the most important of cultivated plants, and in universal cultivation in the temperate parts of the globe. It is a perennial, having herbaceous stems, 1-3 feet high, without thorns or prickles; pinnate leaves with two or more pair of leaflets and an odd one, the leaflets entire at the margin; flowers about an inch or an inch and a half in breadth, the wheel-shaped corolla being white or purple, and more or less veined; followed by globular, purplish fruit, of the size of ordinary gooseberries; the roots producing tubers. The herbage has a slightly narcotic smell, although cattle do not refuse to eat a little of it, and the tender tops are used in some countries like spinach. The tubers are, however, the only valuable part of the plant.

The potato is a native of mountainous districts of tropical and subtropical America, probably from Chii to Mexico; but there is difficulty in deciding where it is really indigenous, and where it has spread after being introduced by man. Humboldt doubted if it had ever been found truly wild; but subsequent travelers, of high scientific reputation, express themselves thoroughly satisfied on this point. Except that the tubers are smaller, the wild plant differs little from the cultivated. Maize and the potato are the two greatest gifts which America has given to the rest of the world. The potato has been cultivated in America, and its tubers used for food, from times long anterior to the discovery of America by Europeans. It seems to have been first brought to Europe by the Spaniards, from the neighborhood of Quito, in the beginning of the 16th c., and spread from Spain into the Netherlands, Burgundy, and Italy, but only to be cultivated in a few gardens as a curiosity, and not for general use as an article of food. It long received throughout almost all European countries the same name with the batatas (q.v.), or sweet potato, which is the plant or tuber meant by English writers down to the middle of the 17th c., in their use of the name potato. It appears to have been brought to Ireland from Virginia by Hawkins, a slave-trader, in 1565; and to England by sir Francis Drake, in 1585, without attracting much notice, till it was a third time imported from America by sir Walter Raleigh. It was still a long time before it began to be extensively cultivated. Gerard, in his *Herball*, published in 1597, gives a figure of it under the name of *batata Virginiana*; but so little were its merits appreciated that it is not even mentioned in the *Complete Gardener* of London and Wise, published more than a century later, in 1719; while another writer of the same time says it is inferior to skirret and radish! It began, however, to be imagined that it might be used with advantage for feeding "swine or other cattle," and by and by that it might be useful for poor people, and for the prevention of famine on failures of the grain crops. The royal society took up this idea, and in 1663 adopted measures for extending the cultivation of the potato, in order to the prevention of famines. To this the example of Ireland in some measure led, the potato having already come into cultivation there, to an extent far greater than in any other European country, and with evident advantage to the people. From Ireland, the cultivation of the potato was introduced into Lancashire about the end of the 17th c., soon became general there, and thence spread over England; so that, before the middle of the 18th c., it had become important as a field crop, which it became in the s. of Scotland some 29 or 30 years later; about the same time, in Saxony and some other parts of Germany; but not until the latter part of the century in some other parts of Germany and in France. In France, the extension of potato culture was very much due to the exertions of Parmentier. In some parts of Germany, the governments took an interest in it, and promoted it by compulsory regulations.

The potato is of great importance as affording food both for human beings and for cattle; and next to the principal cereals, is the most valuable of all plants for human food. It is also used for various purposes in the arts. No food-plant is more widely diffused; it is cultivated in subtropical countries; and struggles for existence in gardens, even within the arctic circle, yielding small and watery tubers; although the effects of late spring frosts, or early autumnal frosts, upon its foliage often prove that it is a plant properly belonging to a climate milder than that of most parts of Britain. No more important event of its kind has ever taken place than the general introduction of potato culture into the husbandry of Britain and other European countries. It has exercised a most beneficial influence on the general welfare of the people, increasing national wealth, and preventing, as a few far-seeing thinkers had anticipated, the once-frequent returns of famine. That in 1846 and 1847 terrible famine resulted in Ireland and elsewhere from the failure of the potato crop itself, was owing only to the excess to which its cultivation had been carried. The results confirmed two great laws, that plants long very extensively or almost exclusively cultivated in any district, however successfully they may be cultivated for a time, are sure to fail at last, and that the exclusive, or almost exclusive, dependence of a people on one source or means of support is unfavorable to their welfare in respect to all their interests.

Humboldt calculates that the same extent of ground which would produce thirty pounds of wheat, would produce 1000 pounds of potatoes. But potatoes are not nearly so nutritious as wheat, and the constant employment of them as the chief article of food

is not favorable to the development of the physical powers, and is consequently in its protracted influence unfavorable to mental energy. All this is too well illustrated in Ireland and the Highlands of Scotland, in a race capable of the highest development of both. It is calculated that 100 parts of good wheat-flour, or 107 parts of the grain, contain as much actual nutriment as 613 parts of potatoes. The inferiority of the potato in nutritious power is very much owing to the comparatively small quantity of nitrogenous substances which it contains, in consequence of which it is most advantageously used along with some very nitrogenous article of food, in Britain generally with animal food, in some parts of Europe with curds or with cheese. The potato tuber, in a fresh state, contains about 71 to 80 per cent of water; 15 to 20 of starch, 3 to 7 of fiber or woody matter, 3 to 4 of gum, dextrine, and sugar, and 2 of albumen, gluten, and casein. There are considerable differences, however, in different varieties, in different stages of maturity, and in different soils and seasons.

Potatoes are used, both raw and boiled, for the feeding of cattle. For human food, they are variously prepared by roasting or boiling, but now chiefly by boiling, a process by which they are freed from all that is narcotic and noxious in their juice. The water in which potatoes have been boiled is not wholesome, and those modes of preparing them for the table which do not admit of its complete rejection ought to be avoided.

The herbage or haulm of the potato has been used for making paper, but the results were not encouraging. The berries are sweetish, but not pleasant; nauseous when fermented, but yield by distillation a tolerable spirit.

The varieties of the potato in cultivation are extremely numerous. Any enumeration or classification of them is impossible. New ones are continually appearing, and old ones passing away. Those most advantageously cultivated in particular soils and climates are often found to degenerate when removed to a small distance. Many of the new varieties of potato are raised in Lancashire, but particularly of the garden kinds, which generally differ from those preferred for field culture in their greater earliness, and not unfrequently in their inferior productiveness, and in their being less *mealy* and less nutritious. Potatoes differ considerably in the character of their herbage—which is sometimes erect, sometimes straggling—and in the size and color of their flowers; but are more generally distinguished by the size, form, and color of their tubers, which are round, long, or kidney-shaped, white, red, dark purple, variegated, etc.

New varieties of potatoes are produced from seed; but potatoes are ordinarily propagated by planting the tubers, or cuttings of the tubers, each containing an *eye* or bud. Late crops of early potatoes are sometimes procured by cuttings of the stalks or by layers; methods which might probably be pursued with more advantage where the summer is longer than in Britain. Much has been written by gardeners and agriculturists on the comparative advantages of planting whole tubers or cuttings; but the latter method generally prevails.

Potatoes are planted in drills, made either by the spade or plow; or in *lazy-beds*, which are always made by the spade, and are beds in which the sets of potatoes are covered over with earth dug out of the alleys. The alleys serve, although imperfectly, for drains in undrained land. The cultivation of potatoes as a field-crop seems to have been first attempted in *lazy-beds*. They are still common in many parts of Ireland, but are now rare in most parts of England and Scotland. They are very suitable for strong, heavy, and somewhat moist land, and are profitably used in reducing some kinds of soil to cultivation; but are generally unsuitable for field-culture, owing to the expense of labor required. In strong heavy land, potatoes are cultivated in raised drills; in lighter and drier soils, the raising of the drills is unnecessary. Manure is generally given, consisting generally of dung and well-rotted straw from the farm-yard. Guano and other strong artificial manures are apt to produce an excessive growth of stalks and leaves, which is to be guarded against by diminishing or even withholding manure in certain soils, potatoes of too luxuriant growth being always particularly liable to diseases. The cultivation of potatoes, after they are planted, whether in the field or garden, consists chiefly in keeping the ground clear of weeds, and in earthing up the plants, to promote the formation of tubers. Potatoes are taken up either by the fork or by turning over the drills with the plow. Garden potatoes are generally used long before they are really ripe, forming a favorite dish in a very unripe state, when they are far from being a safe article of food, and contribute not a little to the prevalence of cholera and kindred diseases in summer. Field potatoes, unless when intended for the supply of the markets of towns, like garden potatoes, are allowed to ripen thoroughly, and are then capable of being stored for winter and spring use. Early potatoes are forced in hot-beds, and in the spare ground of hot-houses, that they may be obtained very early; also, after being thus brought forward in some degree, they are planted out in gardens, for a succession of young tubers. The planting of potatoes in the open air cannot be successfully practiced in most parts of Britain before February or March, and in many seasons the later planted are found as early as the earlier planted, and more productive. The storing of potatoes is variously accomplished in dry lofts or sheds, in airy cellars or barns, and in *pits*, which are sometimes holes excavated to a small depth in the earth, and the potatoes piled up above the surface of the ground, in a conical, or in a roof-like form, sometimes mere heaps of one or other of these forms upon the surface of the ground, and covered with straw and earth to keep out light and frost. The access of light makes potatoes

green, bitter, and unwholesome, as is often seen in those which, whilst growing, have been partially above ground. Potato pits are often ventilated by means of pipes, as without ventilation the potatoes are apt to heat and sprout. Potatoes taken from the ground before they are quite ripe are extremely apt to heat and sprout.

The potato crop is now an important one in almost all the rotations practiced in Britain, although its cultivation is in most districts not quite so extensive as before its failure from the *potato disease* in 1845 and subsequent years, and farmers are more careful not to depend too much upon it. It very commonly succeeds a grain crop, but sometimes is advantageously planted on land newly broken up from grass.

The potato is subject to a number of diseases, of which the most important is the *potato disease* (q.v.) or potato murrain. Before it began to prevail, the chief diseases affecting the potato were those called *curl*, *scab*, *dry-rot*, and *wet-rot*. Of all these diseases, it would seem that one principal cause, however combined with other causes, is the exhaustion of the vegetative powers of the plant, from frequent propagation by tubers or cuttings of tubers. It is to be borne in mind that propagation by tubers is not properly reproduction, but one plant is divided into a multitude; and the whole analogy of nature seems to show, that although it may live longer in this way and more healthfully than if left to the spot where its seed first germinated, its existence will come to an end, and the species must be preserved by reproduction from seed. It was long since observed as to *CURL*, the dread of farmers and gardeners before the *potato disease* was known, that it most readily attacks potatoes which sprang from weak sets. *Curl* is a disease affecting the foliage and general health of the potato plant, and does not seem to be necessarily connected with the presence of any vegetable parasite or insect enemy.—*SCAB* is a disease of the tubers, which become covered with brown, oblong, and finally confluent and cup-shaped spots, whilst under the surface is a powdering of minute olive-yellow grains, a fungus called *tubercinia scabica*, of the division *hyphomycetes*.—*DRY-ROT* is also ascribed to the growth of a fungus of the same order, *fusisporium solani*, and attacks the tubers either when stored for winter or after being planted. It was very carefully investigated by Martius, and described in a memoir published in 1842. It was first observed in Germany in 1820, and caused great loss in that country throughout many years. The tissues of the potato tuber become hardened and completely filled with the mycelium of the fungus, which at last bursts forth in little cushion-shaped tufts loaded with fructification.—*WET-ROT* differs from dry-rot in the tubers becoming soft and rotten instead of hard and dry, and is always characterized by the presence of a fungus referred by Fries to his genus *periola*, but which Berkeley regards as another form or stage of the same fungus which causes or is inseparably connected with dry-rot. Both dry-rot and wet-rot have often been observed along with the *potato disease*, which, however, is always characterized by the presence of another peculiar fungus.

But, besides its value as a culinary vegetable, the potato is important in other respects. Its starch is very easily separated, and is in large proportions: hence it is cheaper than any other kind. It is manufactured on a very large scale both in this country and on the continent. It is chiefly used in textile manufactories under the name of *farina*, which is converted into dextrine or British gum. See *STARCH*. In Holland and in Russia, where there is much difficulty in keeping potatoes through the winter, and there is consequently a necessity for using the crop quickly, large quantities of starch are made, and this is converted into sugar or syrup. See *SUGAR*. The refuse of the starch-manufactories is all economized; it is pressed out from the water, and either used for pig-feeding or for manure. In the north of Europe, much spirit for drinking is made from potatoes; it is called potato brandy.

POTATO-BEETLE. See *COLORADO-BEETLE*.

POTATO BUG, or COLORADO POTATO BEETLE, a name now generally applied to a coleopterous insect, the *doryphora decem-lineata* of Say. It is indigenous to the cañons and table-lands of the Rocky mountains, where it feeds upon various wild species of solanum (*S. rostratum* and *S. cornutum*). As the cultivated potato began to be introduced westward into or towards those regions, the beetle commenced feeding upon it, and the abundance of food thus furnished has caused a great multiplication of the pest, and its rapid extension eastward. It commenced its *raages* in 1859, and for the past five years, that is, since 1876, it has become naturalized in the potato-growing sections throughout the United States and Canada. Its natural history was first made known in 1863 by prof. C. V. Riley, the Missouri state entomologist. In 1865 it crossed the Mississippi river into Illinois and Wisconsin. In 1867 it invaded Indiana and Michigan, and in 1868 it visited Ohio. In 1875 it reached the seaboard, marching faster in the more northern portions because thriving best in the cooler climates, and where the soil is less affected by the droughts of summer. It does not pass *through* the country, but *extends into it*, leaving permanent colonies behind. After the first few years, however, these do not flourish as well as the immigrants and their first descendants, because of the increase of parasites and other enemies which live upon them. The beetle in its perfect state is about one-third of an inch long, of a hemispherical shape, and of a yellow color, with ten black stripes on its elytra, or wing covers, five on each elytron. It passes the winter in the ground beneath the frost at various depths (hibernating), sometimes going 2 or

3 ft. beneath the surface, depending upon the nature of the soil, the average depth being, in the middle states, perhaps from 9 to 12 inches. Soon after the frost is out of the ground and vegetation starts in the spring, and before the potatoes are up, the bug issues from its sleeping place. Whatever else it may feed upon, it does not wait for the potatoes to come out of the ground, but will find the young shoots beneath the surface and commence its depredations. As soon as the leaves are exposed to the air the females commence to lay their eggs, which are deposited in clusters of from 10 to 40 or more, on the under side of the leaf. They are of an orange color, and oval in shape. They hatch within a week, producing dark, dull-red larvæ, which gradually assume a lighter color and acquire two rows of black spots on each side. The legs, the head, and the posterior half of the first joint are also black. The larvæ feed voraciously upon the potato leaves and become full grown in about 20 days, when they crawl into the earth to pass through the pupa and into the beetle state, all of which is accomplished in about five weeks from the time the eggs are laid, or a little over four from the time of hatching. Mr. Riley says that there are three broods produced in one season in the latitude of St. Louis. These broods are, however, not all developed at regular intervals, but owing to the fact that the ovaries continue to develop eggs for a considerable time, each female lays several batches at intervals. Mr. Riley estimates the average number laid by one female to be from 500 to 700. Whole potato crops, sometimes covering scores of acres in a body, have been swept away in a few days by the ravages of the myriads of disgusting larvæ of these beetles. In portions of the country where potatoes are grown near the sea coast, as on the southern shore of Long Island, the insects have either flown or been driven into the waves by the wind in such numbers as to form considerable ridges on the beach when washed ashore; not dead, however, but able to crawl and fly away. They will feed upon other plants of the solanaceæ, but without the cultivated potato they could not multiply as they do. In emergencies they sometimes feed upon other plants, such as pig-weed, maple-leaved goose foot, and some other weeds. Fortunately they have active enemies, viz., insectivorous birds (q.v.), parasitic and predatory insects, and man. The only true parasite of the potato bug is a dipterous insect, a tachinæ fly (*Lydella doryphoræ*), about the size of the common house fly. This insect lays its eggs on the body of the larvæ of the beetle, and when the eggs hatch their larvæ enter that of the beetle, and descend with it into the ground when it goes there to be transformed, this process being arrested, however, by its translation to the bodies of the tachinæ larvæ. Many of its enemies are predatory insects of its own order, *coleoptera*, as the fiery ground-beetle, and others of the *carabidae*, who seize and devour it; several species of lady-bird (q.v.) feed upon its eggs. Other insects of the dipterous and hemipterous orders also pounce upon the beetle and suck its juices, or feed upon it. But as the bug is a greater enemy to man than to anything else, so man is the bug's greatest enemy, and with the use of arsenite of copper, or Scheele's green, commonly called Paris green, he destroys myriads of the pests, and, when persistent and industrious, succeeds in saving his potatoes. There are two modes of using this effective poison; one is to mingle a large tablespoonful of it with about three gallons of water, and sprinkle the attacked plants with a fine sprinkler, once or even twice a day. This is quite rapidly done by active men, each man going between two rows and sprinkling both. The other and most favorite method, the result of recent trials, is to mingle the Paris green with plaster of Paris in the proportion of one part to 25 or even 50 parts of the latter, and dust the leaves of the plant. This does not wash off as soon as the simple watery mixture, as the plaster is not very soluble, and in uniting with a certain portion of atmospheric moisture, forms a thin film or crust, which does no injury, but, remaining as it usually does, if rains are not heavy, a few days, is a protection against the bugs. The application is made with a spoon or some instrument answering the same purpose, as it is dangerous to use the hands. No bad effects upon the persons of the operators have been known to follow the use of this poison by either of these methods, except with the grossest carelessness, and no injury is done to the plant with anything short of an excessive and unnecessary quantity; neither is the soil made injurious to other vegetation, as far as the observations of good authorities go.—There is what is called a *bogus* Colorado potato beetle, the *doryphora juncta*, which much resembles the genuine pest, and has been mistaken for it, but the larvæ have only one row of lateral black spots, and the stripes on the elytra are differently arranged. In the bogus bug the second and third stripes, counting from the lower edge, are joined at the ends, whilst in the potato bug the third and fourth stripes are the ones whose ends are united. The bogus bug, or *doryphora juncta*, does not feed upon the potato, or has not thus far, but upon the wild horse-nettle (*solanum carolinense*), and upon close examination the two species are found to have several marked differences. See COLORADO BEETLE, *ante*.

POTATO DISEASE, or POTATO MURRAIN. No subject connected with agriculture or with botany has given rise within so short a time to so extensive a literature as this. It has been treated in books and pamphlets, and in magazines and periodicals of every kind. The terrible famines caused by the failure of the potato crop in Ireland and other countries, particularly in 1846 and 1847, concentrated upon it the attention of the whole civilized world; and yet it remains very obscure.

The potato disease seems to have been at first confounded with dry rot and wet rot

(see POTATO), which appeared a number of years before it to a formidable extent, although not to be compared with it in their ravages. This fact—and all the more if the potato disease is to be ascribed to the presence of a different and peculiar fungus—may perhaps be held as giving support to the opinion that its chief cause was really the weakening of the plant through too constant cultivation on the same land, and continued propagation by tubers alone.

The potato disease was first observed in Germany, and first assumed a very serious character near Liège in 1842. In 1844 it broke out in Canada, and all at once proved very destructive. In 1845 it was first noticed in England, and first in the isle of Wight. But during that year, its ravages were considerable in the British islands; much more so in the year following, when the Irish famine was the consequence, and in the same year it prevailed very extensively over almost all parts of Europe. The summer was unusually cloudy and moist, a circumstance probably not without its effect. In 1847 the disease was still prevalent, but to a smaller extent; and since that time its prevalence has gradually diminished, although it occasionally breaks out in particular localities. Meanwhile, it is to be observed, that almost all the varieties of potato cultivated to any considerable extent before 1846 have disappeared, and been replaced by others. Lest too much, however, should be inferred from this in favor of a particular theory, it must also be stated, that potatoes newly raised from seed were sometimes severely attacked by the disease during the period of its greatest prevalence.

No fully satisfactory theory as to its cause or origin has been proposed. That it has long existed in the western parts of America, may probably be true, as has been alleged, although the distinction between it and other diseases of the potato might not perhaps be noted with sufficient care; but even this would not account for its sudden appearance and terrible devastations in other parts of the world. Many observers ascribed it to insects and *acari*, some even to infusoria in the tissues, but the presence of none of these was found to be constant, and they appeared therefore rather to be the consequences than the cause of the disease. It is otherwise with the fungus, *botrytis infestans* (see BOTRYTIS), which is always present, although, probably like other parasites, it generally attacks an already weakened plant. The disease generally first appears in the leaves, and thence extends to the tubers, although it has been sometimes observed to appear in the tubers of some of the early kinds of which the leaves have perished before the season when it breaks out. It sometimes also lies dormant in the tubers for months, so that after being stored apparently sound in autumn, they become diseased in the following spring. When the disease appears in the growing plant, brown spots are first to be noticed on the margins of the leaves, corrugating the leaves as they spread. Very rapid extension of the disease, and decay of the leaves and stalks often ensue. It is on the under surface of the leaf that the *botrytis* is found; it abounds also in the diseased tubers, which, when cut, produce an abundant crop of it from the fresh surface, and it sometimes vegetates even from the natural surface. The same fungus has been found in the berries of the tomato (q. v.) when diseased, and on the leaves of other plants of the natural order *solanææ*, but never on any plant not of that order. See COLORADO BEETLE.

The starch granules which exist within the cells of potatoes seem not to be affected by the potato disease, but remain unaltered in quality, so that as good potato starch is made from unsound as from sound tubers. On occasion of the great ravages of the disease in 1846, however, advantage was but partially taken of this fact, partly from ignorance of it; partly from an apprehension, apparently quite unfounded, that the starch might prove unwholesome; and partly from the want of machinery to grate down the diseased potatoes before rotteness had involved the whole.

POTATO-FLY, *Anthomyia tuberosa*, a dipterous insect of the same genus with the beetle-fly, cabbage-fly, turnip-fly, etc. In its perfect state, it is very like the house-fly. The male is about five lines long, grayish-black, bristly, with five indistinct broad stripes on the back, and four ocherous spots on the second and third segments; the female ashy-slate color, with two indistinct ocherous spots on the second abdominal segment. The maggots are very abundant in bad potatoes in autumn, and are very different from the maggots of the house-fly, being horny, spiny, bristly, and tawny; the long tail ending in six long bristles. The pupa is very like the larva.

POTATO, SWEET. See BATATAS, *ante*.

POTCHINKY, a district town of European Russia, in the government of Nijni-Novgorod, 110 m. s.e. of the city of that name, and 800 m. s.e. from St. Petersburg. It is one of the centers of the corn-trade of the country, and exports potash. Pop. '67, 7,777.

POTEMKIN,* GREGORY ALEXANDROVITCH, the most celebrated of the czarina Catharine II.'s favorites, was born near Smolensk in Sept., 1736. He was descended of a noble Polish family, and at an early age entered the Russian army, and rose to be ensign in the imperial horse-guards. Happening to attract the notice of the czarina by his noble appearance and handsome, athletic figure, he was forthwith (1762) attached to her household, and appointed colonel and gentleman of the bed-chamber. After a time (1774) he superseded Gregory Orlov (q. v.) in the good graces of the czarina, and became

* The name is pronounced *Potiumkine* by Russians.

her favorite and avowed lover. He played the part of lover for only two years, when he was superseded by a younger and more amiable successor; but the ascendancy which he had acquired over the czarina was in nowise affected by this change. He knew well how to flatter her vanity, rouse her fears, and make her believe that he alone could protect her from the numerous conspiracies (some of which were real, and many mythical) which were being constantly formed against her. Catharine submitted to all his caprices, consulting him in everything, and was in almost all cases guided by his advice. Potemkin was consequently, from 1770 till the year of his death, the true representative of the Russian policy in Europe; and Frederick the great of Prussia, and even the haughty Hapsburgs, Maria Theresa and Joseph II., cringed at his feet, and at the demand of the czarina, loaded him with titles and honors; though, much to his chagrin, he failed to obtain the English order of the Garter, and the French one of the Holy Spirit. Potemkin interfered little with the internal government of Russia, beyond offering many valuable suggestions for the development of manufactures and industry, which were carried out; his important achievements being connected with the foreign policy of Russia, especially as far as it related to Turkey. It was at his instigation that the Turks were forced into war, and robbed of their territories n. and e. of the Black sea, in order that Russia might possess a southern sea-board; and after this had been done, Potemkin immediately ordered the creation of a Black sea fleet, and the building of Kherson, Kertch, Nikolaiev, and Sebastopol. For his services, he was created governor of the Taurida (q. v.), and loaded with numerous honors and presents. In 1787 Catharine paid a visit to him at his government, and the "hoax" which he played off on his sovereign is well described by De Segur. He caused an immense number of wooden painted houses to be constructed, and grouped into towns and villages along the route the czarina was to take, and hired people to act the part of villagers, merchants, tradesmen, and agriculturists, engaged in their various pursuits. The czarina's vanity was hugely gratified at the seeming improvements of the country under her rule, and Potemkin was rewarded for his dexterity by further honors and emoluments. Almost immediately after this a war broke out with the Turks, and Potemkin was placed at the head of the army, with Suwarof and Reppin for his lieutenants. His career was one of uninterrupted victory. Bessarabia and the two principalities were conquered, and he was about to advance on Constantinople, when the empress commanded a cessation of hostilities; but before Potemkin had time to bring her round to his own views, he was seized with sudden illness on the road between Jassy and Nikolaiev, and died there, Oct. 15, 1791.

POTENT, Cross, in heraldry, a cross crutch-shaped at each extremity. It is also called a Jerusalem cross, from its occurrence in the insignia of the Christian kingdom of Jerusalem, which are, argent a cross potent between four crosslets or. This coat is remarkable as being a departure from the usual heraldic rule which prohibits the placing of metal upon metal.

POTENT COUNTER POTENT, one of the heraldic furs, in which the field is filled with crutch-shaped figures alternately of metal and color, those of opposite tinctures being placed base against base, and point against point. The metal and color are understood to be argent and azure, unless they be specially blazoned otherwise. Potent counter-potent is sometimes blazoned vary-cuppy.

POTENTÉE, a heraldic line of division which takes the form of the outline of a succession of crutch-shaped figures.

POTENTILLA, a genus of plants of the natural order *rosaceæ*, suborder *potentilleæ*, differing from *fragaria* (strawberry) in the fruit having a dry instead of a succulent receptacle. The species are very numerous, natives chiefly of northern temperate regions, and some of them of the coldest north; most of them perennial herbaceous plants, with yellow, white, red, or purple flowers, and pinnate, digitate, or ternate leaves. They are often called **CINQUEFOIL** (Fr. five-leaved); and some of the species are favorite garden flowers. A few are natives of Britain; one of the rarest of which is a shrubby species (*P. fruticosa*), forming a large bush, with pinnate leaves, and a profusion of yellow flowers, often planted in shrubberies. *P. reptans*, a common British species, with creeping stems, digitate leaves, and yellow flowers, once had a high reputation as a remedy for diarrhea, from the astringent property of its root, of which most of the species partake with it. But *P. anserina*, a very common British species, properly known as **SILVERWEED**, having creeping stems, yellow flowers, and pinnate leaves, which are beautifully silky and silvery beneath, has an edible root, with a taste somewhat like that of the parsnip. Swine grub it up with avidity, and it was once much esteemed as an article of food in some parts of Scotland, particularly in the Hebrides, where it abounds and has been a resource in times of famine.—The name potentilla is said to be derived from the Latin *potens*, powerful, and to allude to medicinal virtues now known to merit little regard. *Tormentil* (q. v.) is sometimes referred to this genus.

POTENZA (anc. *Potentia*), in s. Italy, the chief t. of the province of Potenza, is situated on a hill of the Apennines, near the river Vassente or Basento, 54 m. e. of Salerno. Pop. 18,500. It is surrounded by a wall, has a fine cathedral of the Doric order, and is the seat of an archbishop. Potenza was shaken by earthquakes in 1273,

1694, and 1812. The province of Potenza, which, as a *compartimento* of the kingdom, is called Basilicata, used to suffer severely from brigandage.

POT-HERBS are not, as might be supposed from the name, the vegetables chiefly used for culinary purposes as a supplying articles of food, but rather those which are of secondary importance, and valuable chiefly for flavoring, as parsley, fennel, etc.

POTHIER, ROBERT JOSEPH, 1699-1772; b. Orleans, France; studied law, practiced successfully, and became a judge in his native town. In 1849 he was appointed a professor of French law. He is best known by his legal writings. His *Maritime Contracts, Law of Obligations or Contracts, and Contracts of Sale* have been published in this country, the first translated by Caleb Cushing. His most important work was *Pandectæ Justinianæ in Novum Ordinem Digestæ*.

POT-METAL is an alloy of lead and copper, obtained by throwing lumps of copper into red-hot melted lead. It is of a gray color, brittle and granular.

POTOCKI, IGNAZY, 1751-1809; b. Poland; cousin of Stanislaw. He helped to form the constitution of May 3, 1791; fled to Prussia upon the invasion of Poland by the Russians, but returned after the success of Kosciuszko, and was a member of the new government. He was made prisoner by Suvaroff, and confined in Schlusselfurg. Released in 1796, he lived in Galicia till the approach of Napoleon's army in 1806, when he was again imprisoned for a short time.

POTOCKI, STANISLAW FELIX, 1745-1803; b. Poland; in 1792 in conjunction with Branicki and Rzewuski, issued the manifesto of the confederation of Targowitza. The next year he attempted by the aid of Catharine II. to carry out the objects of the confederation. The insurrection of 1794 forced him to leave Poland, and he came to the United States. In his absence he was sentenced to death for treason, but the success of Suvaroff enabled him to return to Poland, and he was appointed field-marshal by Catharine.

POTOCKI, STANISLAW KOSTKA, 1757-1821, brother of Stanislaw Felix, was prominent in drawing up the constitution of Poland of 1791, and after the second partition, in 1792, was for a short time under arrest. After his release he became eminent in science and literature. In 1807 he was made president of the Warsaw board of education; and after the kingdom of Poland was reorganized, 1815, became minister of public instruction. He wrote a treatise on the *Art of the Ancients and On Eloquence and Style* (1815).

POTOMAC, a river of the United States, formed by two branches, which rise in the Alleghany mountains, and unite 20 m. s.e. of Cumberland, Maryland, from which point the river flows in a generally south-easterly course, 400 m., and falls into Chesapeake bay, where it is 6 to 8 m. broad, 75 m. from the ocean. Line-of-battle ships ascend to Washington, 120 m. from its mouth, and the tide reaches Georgetown. Between Westport and Washington, 220 m., it falls 1160 feet. The scenery in this portion of its course is wild and beautiful, especially where it breaks through the Blue ridge at Harper's ferry. Its principal affluents are the Shenandoah, Savage, Monocacy, and Acquia creek. The Potomac forms the greater part of the boundary between Virginia and Maryland. During the war which began in 1861, both federal and confederate armies crossed several times the fords of the upper Potomac, and severe actions were fought upon its banks.

POTOROO, or KANGAROO RAT, *Hypsiprimum*, a genus of marsupial quadrupeds, of the family *macropidæ* (see KANGAROO), differing from kangaroos chiefly in having distinct canine teeth in the upper jaw. The first pair of incisors in the upper jaw are also longer and larger than the others. The molars decrease in size backward; and when not worn, present four blunt tubercles. The fore-limbs are proportionally longer, the hinder-limbs less powerful than in the kangaroos. The general form and habits are similar; there is the same sitting on the hind feet with help of the tail for support, and a somewhat similar hopping, but not nearly an equal power of vigorous leaping. The stomach is large, and divided into two sacs, with several inflations; the food entirely vegetable. There are several species, all of small size, none of them larger than a rabbit, and all natives of Australia, timid and harmless creatures. They are generally clothed with a dense, and sometimes a beautiful fur; but the tail is nearly destitute of hairs and scaly.

POTOSI, a department of Bolivia, having Peru on the w. and s.w., the Pilcomayo river on the e., Chuquisaca on the n.e., and Oruro on the n.; 31,800 sq.m.: pop. 250,000. It is divided into the provinces of Chayanta, Chichas, Potosi, Lipes, and Porco. Its surface is elevated, embracing the Cerro Gordo de Potosi, 16,000 ft. above the level of the sea, containing silver mines of great value. Between 1545-1789 the mines in this department produced \$1,000,000,000 of silver, and at present the annual yield is \$2,250,000; other mineral products are gold, copper, iron, lead, tin, manganese, quicksilver, precious stones, etc. It also includes the Porco, a peak of the Bolivian Andes, containing the first silver mine opened by the Spaniards after the conquest of Peru. The face of the country is varied by lakes in the w. portion, springs are numerous in the mountains, sometimes interfering with mining operations, and it is drained by the branches of the Pilcomayo. The soil is unproductive and the climate is cold. Capital, Potosi.

POTOSI, one of the richest mining-towns of South America, the second t. of Bolivia, and capital of a department of the same name, stands in a dreary and barren district, 13,330 ft. above sea-level, in lat. 19° 35' s., and long. 65° 25' w., 70 m. s.w. of Chuquisaca. It covers a large area, and in 1611 its population was 170,000, but in 1865 it was 25,774, and great part of the town was in ruins. In its center is a large square, around which are ranged the principal public edifices, as the government-house, town-house, cathedral, etc. The mint is a large building, in which the average amount now coined amounts to about \$2,000,000 annually. In the central square an obelisk in honor of Bolivar was erected in 1825. English and French manufactures are imported; and as the country in the vicinity produces little or nothing, all supplies have to be brought from a distance. The Cerro (sierra) de Potosi, or Silver mountain, is 15,200 ft. high. Its summit is honeycombed with upward of 5,000 mines, and operations are now carried on at a lower level, where the inrush of water, however, often compels the miners to abandon the richest mines. The quantity of silver extracted from the mines of this mountain has amounted in one year to the considerable sum of £330,544,311 sterling. —Bollaert's *Antiquities of South America*.

POT-POURRI, in French, the name of a mixture of sweet-scented materials, chiefly flowers, dried, and usually placed in a vase with a perforated lid, in order that their perfume may be diffused through rooms in which it is placed. The principal ingredients are rose-petals, lavender flowers and stalks, violets, jessamine flowers, woodruff leaves, cloves, orris-root, pimento, musk, sandal-wood, raspings, cedar-shavings, etc. But it also signifies a dish of different sorts of viands, and corresponds in this sense to the *hotch-potch* of Scotland, and the *olla podrida* (q.v.) of Spain.

POT-POURRI, in music, a selection of favorite pieces strung together without much arrangement, so as to form a sort of medley.

POTSDAM, a city in the Prussian province of Brandenburg, and, next to Berlin, the handsomest and best built town in Prussia, is situated on an island at the point of junction between the small stream of the Nuthe and the river Havel, 16 m. s.w. of Berlin. Pop. 71, 43,784 (with 5,475 soldiers); in 1875, 45,003. Potsdam is the usual summer residence of the royal family of Prussia, and seat of the imperial court. The city is divided into Old Town and New Town, and has four suburbs. The streets are broad and regularly built, and there are fine squares, some of which are planted with trees, forming pleasant public walks. Of the many large and handsome buildings, one of the most worthy of notice is the old royal palace, an oblong parallelogram, three stories high, with a magnificent colonnade facing the fine Havel bridge. Potsdam has several benevolent and educational institutions connected with the state, as, for instance, two asylums for the orphan children of military men, and one for those of persons belonging to the civil service; schools for cadets, subalterns, and privates; the Luisendenkmal, an institution for providing for indigent girls of irreproachable character; a gymnasium, a high-school, and various other training and special schools. Among the churches, the most noteworthy are the garnisonskirche, with a tower 400 ft. high, a fine chime of bells, and a noble marble pulpit, below which rest the remains of Friedrich Wilhelm I. and Friedrich II., and St. Nicolai's, lately rebuilt after the model of the pantheon at Paris. The Brandenburger-Thor, which is the handsomest of the various gates, is a triumphal arch copied from Trajan's arch at Rome; and this, like the other gates, opens upon a fine *allée* of trees. Potsdam is surrounded with pleasant public walks and gardens, wooded heights, and vine-covered banks; while in the immediate neighborhood are numerous royal country palaces, as Sans-Souci, the favorite residence of Frederick the great, surrounded by a fine park, pleasure-grounds, and choicely-stocked gardens, near which stands the Ruinenberg, with artificially constructed ruins, designed to conceal the water-works which supply the fountains of the palace. Near the park is the new palace, begun in 1763, 680 ft. in length, containing nearly 100 rooms, many of which are filled with costly works of art. Near Sans-Souci is Charlottenhof, built by the late king, a pleasant villa, with lovely gardens, in which stands a Pompeian house. The Russian colony of Alexandrowska, with its Russian houses and Greek church, lies near the Pfingstberg, which is surmounted with an unfinished palace, from whence a fine view is obtained of the numerous royal parks and gardens, and the surrounding country. In the new garden stands the marble palace, with arcades adorned with frescoes of the *Nibelungen Lied*.

Potsdam is the seat of the provincial government, and of several of the state manufactories. Of these, the most important is the manufactory of arms, at which the rifles for the army are made. There are also numerous private manufactories of machinery, chocolate, tobacco, cotton goods, silk, leather, wax-cloth, beer, etc.

Potsdam owes its creation as a town to the great elector Friedrich Wilhelm, who built a royal palace here between 1660 and 1673, and laid out several good streets. Prior to that period it was an insignificant fishing village, built on the site of an ancient Wendish settlement.

POTSDAM, a township and village in New York, on Rackett river, St. Lawrence co., in the northern portion of the state, between lakes Ontario and Champlain. There are quarries of sandstone, mills and factories on the falls of the river, a railway connecting it with Watertown, a bank, and six churches. Pop. '70, 7,774.

POTSDAM SANDSTONE, the term applied by New York geologists to the lower member of the lowest Silurian series, so called from Potsdam, New York. It is a red or yellow sandstone, found in New York and in the far w., upon the crystalline cozoic rocks, and in Missouri and s.w. upon the Huronian.

POTSTONE, *Lapis ollaris* of the ancient Romans, a variety of talc (q.v.), or rather a mineral formed by a mixture of talc with chlorite, etc. It is generally of a grayish-green color, sometimes dark green. It occurs massive, or in granular concretions. It is soft and easily cut when newly dug up; greasy to the touch, and infusible even before the blow-pipe. It becomes hard after exposure to the air. It is made into pots and other household utensils, which communicate no bad taste to anything contained in them, and when greasy are cleaned by the fire. It was well-known to the ancients; and Pliny describes the manner of making vessels of it. It was anciently procured in abundance in the isle of Siphnos (now Siphanto), one of the Cyclades, and in Upper Egypt. Large quarries of it were wrought on the lake of Como, from about the beginning of the Christian era, to Aug. 25, 1618, when they fell in, causing the destruction of the neighboring town of Pleurs, in which it was wrought into culinary vessels, slabs for ovens, etc. It is quarried in the Valais, where it is called *giltstein*; in Norway, Sweden, Greenland, and near Hudson's bay, etc. "Should you again visit Italy, and pass by the great St. Bernard, if the cold of that frigid region should induce you to warm yourself in the refectory of the hospitable monks of the convent, you will there see a stove of potstone."—*Jackson on Minerals and their Uses*.

POTT, AUG. FRIEDR., a distinguished philologist, was born at Nettelrede in 1802, attended school at Hanover, studied theology and philology at Göttingen (1821), and finally (1833) became professor of the science of language in the university of Halle. Next to W. Humboldt, Bopp, and Grimm, the name of Pott stands prominent in the new science of comparative philology. The foundation of his reputation was laid by his *Etymologische Forschungen* (Etymological Researches, 2 vols. Lemgo, 1823-26), a work second in importance only to Bopp's *Comparative Grammar*. In a well-known article in Ersch and Gruber's Encyclopædia, *Indogermanischer Sprachstamm* (2d sect. vol. 18), he gave a masterly sketch of the Aryan languages (q.v.). In numerous articles in periodicals, and in separately published treatises (e.g., *De Borussico-Lithuanica tam in Slavicis quam in Letticis Linguis Principatu*, Halle, 1837-41; and *Die Zigeuner in Europa und Asien*, 2 vols. Halle, 1844-45), he carried his researches into special fields of this great province. *Die Quinare und Vigesimal Zählmethode* (The Quinary and Vigesimal Notation, Halle, 1817), and *Die Personennamen* (Proper Names, Leip. 1853), are admirable treatises, containing an overwhelming mass of information, and showing an astonishing knowledge, not only of the Aryan languages, but of other Asiatic, African, and American races. In 1856 he published a work on the *Difference of Races from a Philological Point of View*, and in 1868 one on the *Diversities of European Languages*.

POTT, PERCIVAL, 1713-88; b. London; assistant surgeon in St. Bartholomew's hospital, and in 1749 one of the principal surgeons. He has always been distinguished for his investigation of the subject of angular curvature of the spine, the consequence of disease of the bones of the spinal column, on which account the affection is known as Pott's disease (q.v.). His principal works are: *A Treatise on Ruptures; Hernia Congenita; Observations on Fistula Lachrymalis; Observations on the Nature and Consequence of Wounds and Contusions of the Head; General Remarks on Fractures and Dislocations; On the Cure of Hydrocele by Seton; Remarks on that kind of Palsy of the Limbs which attends Curvature of the Spine; Further Remarks on Curvature of the Spine*.

POTTAWATTAMIE, a co. in s.w. Iowa, bounded on the w. by the Missouri river, drained by the Boyer and West Nisnabotona rivers, and Keg, Mosquito, Silver, and Walnut creeks; traversed by the Chicago and Northwestern railroad; about 990 sq.m.; pop. '80, 39,846—32,740 of American birth. The surface is rolling prairie or woodland. The soil is fertile. The principal productions are corn, wheat, hay, and oats. Co. seat, Council Bluffs.

POTTAWATTAMIE, a co. in n.e. Kansas, bounded on the s. by the Kansas river, and on the w. by the Big Blue; drained by Rock and Red Vermilion creeks; traversed by the Kansas Pacific railroad; about 850 sq.m.; pop. '80, 16,347—13,615 of American birth. The surface is rolling. The soil is fertile. The principal productions are corn, oats, wheat, and live stock. Co. seat, Louisville.

POTTAWATTAMIES, an Algonquin tribe of Indians. They originally occupied lands in the lower Michigan peninsula, were warlike in character and had less of tribe organization than most Indian races. They aided the French in their war with the Iroquois, who had driven them as far w. as Green bay. The Pottawattamies took part in Pontiac's war and in the capture of fort Joseph, were hostile to the colonists in the revolution, and in the war of 1812 again aided the English. In 1815 they made a treaty giving up their lands in Michigan, Illinois, and Indiana; and about 800 of the 4,000, belonging to different bands, were removed to a large reservation on the Missouri river. Missions had been established among them at an early date by French priests; and those originally living on the Huron, St. Joseph and Wabash rivers were somewhat advanced in civilization. In treaties of 1862 and 1867 the right to take title in severalty

was granted, and 1400 took advantage of the offer, 700 continuing in the tribal relation. The latter were mostly the prairie or roving bands. They have since been greatly scattered among other tribes; the remnant occupies a reservation in Jackson co., Kansas, and are under the charge of the Quakers.

POTTER, a co. in n. Pennsylvania, bounded n. by New York; drained by the Genesee and Alleghany rivers and several creeks; 1050 sq.m.; pop. '80, 13,798—12,822 of American birth. The surface is rugged and hilly. Potatoes, hay, oats, and dairy products are the staples. Coal is found. Lumber is the chief export. Co. seat, Coudersport.

POTTER, ALONZO, D.D., LL.D., 1800-65; b. Dutchess co., N. Y.; entered Union college when 15 years old, attaining at once the highest rank in his class; was appointed tutor before 21 years of age, and, a year after, professor of mathematics; ordained a presbyter in the Protestant Episcopal church, 1824; and became rector of St. Paul's church, Boston, 1826. Resigning with impaired health, 1831, he was immediately elected professor of intellectual and moral philosophy in Union college, and in 1838 vice-president; elected and consecrated bishop of the diocese of Pennsylvania, 1845. Few Christian ministers were more honored, not by his own church alone, but by all denominations of Christians. He went to California for his health; but contracted a fever on the isthmus, and died on board the steamer in the harbor of San Francisco, three days after his arrival. Among his published writings are, *The Principles of Science applied to the Domestic and Mechanic Arts; Political Economy; Discourses, Charges, and Addresses; Religious Philosophy*; and five courses of *Lowell Institute Lectures*, published only in a newspaper report.

POTTER, CLARKSON NOTT, b. Schenectady, N. Y., 1825; son of bishop Alonzo Potter; received his education at Union college, where he graduated in 1842, and at the Rensselaer institute, Troy, N. Y., in 1843, where he studied civil engineering. He practiced surveying for a time in Wisconsin, and then studied law, and was admitted to practice at the Wisconsin bar. He removed to New York in 1847, and soon established himself in a lucrative business. Entering politics with much energy, he reached a prominent position, and in 1871 was elected a democratic representative in congress, and re-elected continuously, including an election to the 45th congress. He became conspicuous in 1878 as chairman of the committee appointed by the house of representatives to investigate the "alleged fraud in the late presidential election in the states of Louisiana and Florida." Mr. Potter was not a member of the 46th and 47th congresses.

POTTER, ELIPHALET NOTT, D.D., son of bishop Alonzo Potter, and grandson of president Nott; b. Schenectady, N. Y., 1836; graduated at Union college, 1861; studied theology; was ordained presbyter in the Protestant Episcopal church; and was rector of churches at Troy, N. Y., and Bethlehem, Penn.; was chosen professor of Christian evidences in Lehigh university, 1866; and president and chancellor of Union university (formerly Union college), 1872; has published *Parochial Sermons*; and is writing *Christian Evidences at the Close of the Nineteenth Century*.

POTTER, ELISHA REYNOLDS, 1764-1835; b. Rhode Island; a blacksmith's apprentice in his youth, but succeeded in acquiring some knowledge of the law, and followed that profession until about 1793. From this time for twenty-five years he was a representative in the state assembly, or in congress. He was five times speaker of the house, and was a candidate for governor of Rhode Island in 1818. Hon. Josiah Quincy says of him, "The position of Mr. Potter in his native state has now faded to a dim tradition. It was of the authoritative kind which belongs to men who bear from nature the best credentials." Drake remarks, "Few political men in Rhode Island ever acquired or maintained a more commanding influence." Mr. Quincy, further describing him, says he was "one of the largest men I have ever seen, excepting of course the professional giants." This was so far the fact that when he traveled he was obliged to pay for two seats in a stage-coach.

POTTER, HAZARD ARNOLD, 1810-69; b. N. Y.; studied medicine at Bowdoin college, and began practice in Rhode Island. Soon afterward he removed to Geneva, N. Y., where he acquired a high reputation as a surgeon. Among his successful operations were ligature of the carotid artery, gastrotony for intussusception of the bowels, removal of fibrous tumors of the uterus, and the removal of ovarian tumors.

POTTER, HORATIO, D.D., LL.D., brother of Alonzo; b. Dutchess co., N. Y., 1802; graduated at Union college, 1826; ordained presbyter in the Protestant Episcopal church, 1828, in which year also he became professor of mathematics and natural philosophy in what is now Trinity college, Hartford; rector of St. Peter's church, Albany, 1838; on the death of bishop Wainwright, 1854, was elected provisional bishop of the diocese of New York; and by the death of bishop Onderdonk, 1861, became bishop of the diocese. The 25th anniversary of his consecration was celebrated by his diocese, Nov. 23, 1879, with a religious service in Trinity church, with a congratulatory address, and the presentation to him of a silver chalice and paten, lined with gold. On a subsequent evening a public reception was held in the academy of music, when the building was crowded with an assemblage in which were many men distinguished in church and state; and a model of the ark of the covenant of gold, silver, and steel, was presented to him by the

diocese as a testimonial. Among the addresses were those by hon. John Jay and hon. W. M. Everts, secretary of state.

POTTER, JOHN, D.D., an English scholar and divine, the son of a linen-draper of Wakefield, in Yorkshire; was b. in 1674; studied with great diligence and success at Oxford, where he took his degree of M.A. in 1694, and in the same year went into orders. He was appointed chaplain to queen Anne in 1706, professor of divinity at Oxford in 1708, bishop of Oxford in 1715, and finally in 1737 attained the highest dignity in the English church—the archbishopric of Canterbury. He died Oct. 21, 1747, and was buried at Croydon. Potter was really a superior scholar, but of the dull and plodding sort. Nowhere does he flash a ray of clear searching intelligence on his subject; his habit of mind is quite uncritical, and consequently his learned labors, though creditable to his industry, have added nothing to our knowledge, and have now "followed" their mediocre author into something very like oblivion. Potter's principal work is his *Archæologia Græca* ("Antiquities of Greece," 2 vols. 1698), superseded for many years by Dr. W. Smith's *Dictionary of Greek and Roman Antiquities*; besides which, however, we may mention his edition of *Lycophron* (1697), and of *Clemens Alexandrinus* (1715). As a church dignitary the linen-draper's son is said to have been haughty; he was likewise very "zealous" in matters ecclesiastical, a vigilant guardian of clerical interests, and strictly, perhaps we may even say excessively, orthodox.

POTTER, PAUL, one of the most distinguished masters of the Dutch school. He was b. at Enkhuyzen in 1625, and was the pupil of his father, Pieter Potter, an obscure painter. His progress was so rapid, that by the time he had attained the age of 15 his reputation as an artist was high. He left Amsterdam and established himself at the Hague, where, in 1650, he was married; in 1652, however, he returned to Amsterdam, at the solicitation of the burgomaster Tulp, who commissioned him to paint a great number of works; but his health, which was delicate, gave way under constant application at his easel, and he died before he had completed his 29th year. Paul Potter's cattle-pieces are perhaps more highly valued than pictures of that class by any other master, for none have combined and brought out with such admirable technical skill so many of the qualities that give a charm to such works. His pictures bring immense prices, particularly those painted between 1652 and 1654, when he died. Potter executed some admirable etchings.

POTTER, LOUIS JOSEPH ANTOINE DE, 1786-1859; b. Belgium; after a long residence in Germany, France, and Italy, returned to Brussels in 1824. For his opposition to the Dutch government, he was sentenced in 1828 to pay a fine of 1000 florins, and a imprisonment for a year and a half. During his imprisonment he composed a pamphlet on the *Union of the Catholics and Liberals*; and for this and other publications he was condemned in 1830 to banishment for 8 years. After the Belgian revolution, he was a member of the provisional government, upon whose downfall he withdrew to France. His best production is his *Philosophical History of Christianity*.

POTTER, ROBERT B., b. N. Y. about 1830; son of bishop Anson Potter, grandson of prest. Nott, left the practice of law which he had successfully established, and entered the army in 1861 as major in the volunteer force. He served with distinction in the battles of Roanoke island (where he led the attack), at Newbern (where he was wounded), Cedar Mountain, Manassas, Chantilly, and Fredericksburg. He took the stone bridge at Antietam, was wounded, went through the battle of Fredericksburg, and was made brig. gen. 1863. He commanded the 2d division 9th corps at Vicksburg, also, in the Tennessee campaign against Longstreet, and at the siege of Knoxville he held conspicuous positions. In the last campaign in Virginia he commanded a division under Grant; was made brev. maj. gen. 1864, and was severely wounded in the battle before Petersburg 1865.

POTTER'S CLAY, or **FIGULINE**, a kind of clay (q. v.); either slaty and massive, or, more generally, earthy; yellow, yellowish-white, gray, or sometimes greenish; adhering strongly to the tongue, and forming a paste with water. The earthy variety is sometimes very loose, sometimes almost solid. Potter's clay is a mineral of very common occurrence in alluvial districts, and sometimes occurs in beds of considerable thickness. It occurs in many parts of Britain. It is used in potteries for the manufacture of earthenware; the different varieties of it being adapted to different kinds of earthenware. Houses are built in Egypt of pots of this material. Potter's clay is also employed in agriculture for the improvement of light sandy and calcareous soils.

POTTERY. This term—supposed to be derived from *poterion*, the drinking-cup of the Greeks, and transmitted by the French word *poterie*—is applied to all objects of baked clay. The invention of pottery dates from the most remote period, and its application is almost universal—objects of pottery being in use among races even semi-barbarous. The art of molding or fashioning vessels of moist clay, and subsequently drying them in the sun, is so obvious, that it is not above the intelligence of the rudest savage. Hence, at the most remote antiquity, the Egyptians, to whom precedence must be assigned in this art, made bricks of unbaked or sun-dried clay, cemented with straw, which were quite sufficient for the purposes of construction in a country where little or no rain falls. These bricks, in shape resembling those in use at the present day, but of larger dimen-

sions, were impressed, at the earliest period, with the marks of the brick-maker, and later, with the names and titles of the kings for whose construction they were made. The oppression of the Hebrews chiefly consisted in compelling them to work in the brick-fields—a task imposed on captives taken in war and reduced to slavery; and the fortresses of Pithom and Rameses, on the Egyptian frontiers, were made of bricks by the Hebrews. Kiln-dried bricks, in fact, did not come into use in Egypt till the Roman dominion, although some exceptional objects of the class of bricks have been found, such as a kind of conical plug, stamped on the base with the names of the tenants of the tombs. A few other objects were made in unbaked clay; but vases of baked earthenware were in use at the earliest period of Egyptian civilization, and are contemporary with the pyramids themselves. The Egyptians made a red ware, a pale-red or yellow ware, and a lustrous or polished red ware—the two first being used for vases destined for culinary and other purposes, the last for vases of more refined use, such as holding perfumes, wine, honey, and other delicacies. But the most remarkable Egyptian pottery was the so-called porcelain, made of a fine sand or frit loosely fused together, and covered with a thick silicious glaze of a blue, green, white, purple, or yellow color. This celebrated ware, the porcelain of the old world, sometimes exhibits the most beautiful tints of blue, a color which was produced by an oxide of copper, and which is still unrivaled. Objects were made of this material for the decoration of the dead and for the toilet. They were exported from Egypt to the neighboring countries, and are found alike in the tombs of the Greek isles, the sepulchers of Etruria, and the graves of Greece. Most of the figures of deities, the sepulchral ones deposited with the dead, a few elegant vases, portions of inlaying, objects of the toilet, and beads and other decorations, are made of this porcelain. Still finer work of this kind was produced by carving scarabei and other small objects in steatite, and covering them with a blue glaze, so as to combine brilliancy of color with delicacy of execution. The Egyptians had at the earliest period the simpler manipulations and tools of pottery—the potter's lath or wheel, molds for stamping objects, and various other tools. On the decadence of the country under the Greeks and Romans, the pottery became assimilated to the Greek and Roman.

In the contemporary empires of Assyria and Babylon pottery was also in use at an early period. Sun-dried and kiln-dried bricks were made in the reigns of Uruk: and other monarchs of the oldest Babylonian dynasties, about 2000 B.C. Platforms for elevating the larger edifices were made of them; and the bricks, like the Egyptian, were stamped with the names and titles of the monarch, to which was added the locality for which they were destined. Glazed bricks of various colors, occasionally enriched with scenes and ornamental designs, were introduced into constructions; and Semiramis is said to have adorned with them the walls of Babylon. The Assyrians and Babylonians employed this material for historical and legal purposes, making cylinders, hexagonal prisms, and purse-shaped objects of it, on which were impressed extensive writings. One of these remarkable objects contains the account of the campaign of Sennacherib against Judea and the tributes of Hezekiah. The Assyrian and Babylonian pottery resembles, but is not entirely the same as the Egyptian, being of a pale red ware, of thinner substance, finer paste, and more refined shape. At a later period, figures of deities were modeled in terra-cotta. The glazed ware of Babylon and Assyria is coarser than the finest Egyptian, and is the earliest example of the employment of materials for coloring like those now in use; the glaze, however, is silicious. The objects most remarkable for size are the large coffins found at Warka, supposed by some to be the Ur of the Chaldees, with oval covers, and ornaments of the Sassanian period. The potteries of Mesopotamia continued to flourish under the Parthian and Sassanian monarchs till the conquest of Asia by the Mohammedans.

The potter's art is mentioned in the Scriptures, but few specimens of Hebrew wares have been found. Some vases have been exhumed in Phenicia. The most remarkable pottery of antiquity was the Greek, which seems to have had another origin than the oriental. The terms *keramos* and *ostrakon* were applied by them to this material, and they made objects and vases in sun-dried clay, terra cotta, and glazed ware. The use of bricks was by no means extensive in Greece, although some public edifices were made of them. Their first use is attributed to Hyperbius of Crete, and Euryalus or Agrolas. The bricks were made by a mold (*plasion*) and were called after the numbers of palms-length. Some were so light that they floated on water. Besides bricks, tiles, cornices, artificial ornaments, friezes, pipes for conducting water, and drains, were molded in terra cotta. Statues and small figures, *pelinoi*, gaily and appropriately painted, covered with a *leucoma*, or white ground, and occasionally partly gilded, were in common use for votive and other purposes, and sold at a cheap price by the figurist (*koroplasthos*). Dolls, cones, and various smaller objects were made by the potters; they were sometimes modeled, but more generally molded. The Greeks claimed the invention of the potter's wheel; and the principal cities contested the honor of the art, which is mentioned in Homer, and attributed to Coreus of Athens, Hyperbius of Corinth, or Talos, the nephew of Dædalus. Numerous vases for all the ordinary purposes of life were made by it, and others of large form, decorated also by separate ornaments, *emblemata*, attached to them. Large casks or *pilloi* were modeled on a framework of wood. Great quantities of amphoræ, manufactured on the wheel, and used to contain the choice wines of Greece, were exported from Rhodes and other cities: and their débris are found in the

Crimea, Alexandria, Sicily, and other cities. Some of the earlier specimens of a glazed earthenware were painted with colors in fresco or encaustic, from which afterward came the more elaborate pictures of the glazed vases of Greece. To these succeeded two or three classes of painted ware, consisting of rude representations of animals laid upon the pale red ground of the clay in brown outline, a style prevalent at Athens and Asia Minor; which was followed by the potteries of Corinth, or the so-called Phœnician or Egyptian style. The paste of the vases is of a light red or yellow, the figures in a black or moroon color, with portions enriched with crimson or purple; the backgrounds of a pale straw or lemon color; the animals, of a larger size than those of the Athenian vases, intermingled with chimeras and other monsters; the backgrounds variegated with flowers—the whole derived from oriental art. Gradually human figures, with all the characteristics of archaic Greek art, were introduced, with accompanying inscriptions, which cannot be later than the 6th or 5th c. B.C. The subjects of these vases were derived from the oldest Greek myths. The style of this pottery by degrees improved: the paste became pale red or salmon color; the human figures, which had been at first subordinate, replaced the friezes of animal and large ornaments. As the improvement went on, the backgrounds were made of a bright orange-red color, the figures of a deep black; while portions, as the hair, garments, and flesh of female figures, were colored white. The style of art became much freer, although still retaining the rigidity of the Ægean school. Names of figures represented, of the artists who painted and the potters who made the wares, were added, with speeches, and the names of celebrated beauties and athletes of the day. In these styles the vases made on the wheel appear, while yet soft, to have had the subjects traced upon them with a finely-pointed tool; the figures were then filled in with a lucid black pigment of manganese, and then returned to the furnace. The details of the muscles and other portions were incised through the back with a sharp tool, so as to show the lighter background, and the purples, crimsons, blues, and other colors were laid on. The subjects are chiefly derived from the war of Troy and the heroic age; and the shapes in use were oil-jars (*lecythoi*) water-pails (*hydriæ*), wine-vases (*crateres*), wine-jugs (*oinochœ*), and *amphoræ*. They seemed to have continued in use till about 450 or 420 B.C., when the red figures were substituted for black, by tracing, as before, the figures on the clay, then running round them a thick line of flock, and finally filling up the background entirely with a black color—the muscles and inner marking not being incised, but traced in black and brown outlines. The earlier vases of this class, which are of the strong style, resemble those of the black figures; but the style gradually improved, and resembled the art of Phidias and Zeuxis; while the letters are those in use after the archonship of Euclid, 403 B.C. The style and form of these vases altered according to the art of the period, till the ultimate disuse of fictile or painted ware, about 300 B.C., when the conquests of Alexander the great and the increase of luxury caused it to be superseded by vases in metals. In its last stage, the pottery became molded, and was glazed entirely black, or else variegated with opaque white figures and ornaments. The subjects of these later vases differ considerably from the earlier, being chiefly derived from the theater or myths of the later poets. Vases of this description are found in Greece, the isles of the Archipelago, and Italy; into which latter country they appear to have been imported from Greece.

In Italy, indeed, the Etruscans, at an early period, and perhaps some of the principal cities in Magna Græcia, manufactured their own pottery. That of the Etruscans consists principally of three kinds—an unglazed red ware; a lustrous brown ware, made also by the neighboring Sabines and Oscans; and a black ware, the paste or substance of which is black throughout, not superficial, as among the Greeks, and made by mixing some coloring material with the clay. The Etruscan pottery is rarely painted—the black ware never—but it is distinguished by having ornaments in salient and bas-relief modeled or molded on it, and by the shapes of the vases apparently being derived from works in metal, and reproducing the fantastic combinations of oriental art. This ware, which was in use from 500 to 320 B.C., was the source from which subsequently arose the Aretine and Roman pottery. It was ornamented sometimes with incised ornaments; the subjects, however, are generally uninteresting, and it never attained a high position in art. The Etruscans, however, in later times imitated the painted vases of Greece, but their clay is much paler, the drawing coarser, and the shapes less elegant. In terra cotta statues they particularly excelled, and supplied the Romans with the figures of their divinities. Even sarcophagi were made of this material.

On the decline of the pottery of the Greeks and Etruscans, a new kind of ware was made at Arezzo, or Arretium, to which has been given the name of Aretine, and which resembled the later ware of the Greeks. It is evidently imitated from works in metal, in all probability from the chased cups of silver and gold which began to come into use in Italy, and was a continuation of the later molded wares of Greece and Italy. The vases were of a bright red or black color; the paste uniform in color throughout, but covered with a lustrous siliceous glaze. The red color nearly resembles in color and texture a coarse sealing-wax; the paste is often remarkably fine. The vases, generally of small dimension, were turned on the lathe; the ornaments were molded separately, and attached to the vase; patterns were produced by the repetition of the same mold, or by placing bas-reliefs from various molds on the vases. This kind of pottery was first made at Arezzo, but subsequently, or nearly simultaneously, was produced at Capua and

Cumæ in the 1st c. A.D. It afterward extended over all the Roman world, and was made in Gaul and Germany. It was called Samian ware under the republic, and was at first extremely fine, but deteriorated under the last of the twelve Cæsars, and is no longer found under the Antonines; a red ware, glazed with red-lead and copper, having been substituted for it. The names of several hundred potters are found stamped upon extant specimens of this ware, and some of them are evidently of Gaulish or British origin. These names are followed by F., *fecit*, or made; M., *manu*, or by the hand of; and OF., *officina*, or establishment. The ware was extensively imported into Britain and the remoter provinces of the empire; and wherever found, shows the influences of Roman civilization. Furnaces for it have been found in France and Germany, but not in England. The other kinds of Roman ware were local, evidently made upon the spots where found, but with inferior ornamentation. Black-ware seems to have succeeded this, and to have been produced by confining the smoke of the furnace, and throwing it down upon the heated ware. In Britain varieties of this ware were made at Castor, in Northamptonshire, ornamented with bas-relief, laid on by the process of depositing a fluid clay on the wet ware, and molding it with a tool. The style of art is Gaulish. Other vases of glazed ware were manufactured at Upchurch, near Rochester, and at Crockhill in the New Forest. They have only a few ornaments, either stamped or painted in a white pipe-clay on the surface. These vases are probably as late as the 3d c. A.D. Later arose a black-ware, generally bottles or jugs, glazed externally, and with single words, invitations to drink, painted on them, in a white pipe-clay. Many varieties of unglazed ware, red, yellow, white and gray, were extant in the 2d and 3d centuries. The large culinary and other vessels were made of these—such as casks (*dolia*), *amphoræ*, jugs (*agenæ*), and mortars (*mortaria*)—the last at Lyons. The Romans made great use of brickwork terra cotta. All over the empire bricks were made for public and private buildings, and stamped at Rome with the name of the proprietors of the land, the potters, and the consulate of the period, till the middle of the 3d c. A.D. Bricks were also extensively manufactured by the legionaries, and bear their names and titles. The graves of the soldiery were often constructed of them. At Rome, the last inscribed bricks are those of Theodoric; none so late have been found in Britain or Gaul. Tiles, cornices, roof ornaments, and gutters were formed of terra cotta; so were the votive figures offered to the gods; but they all disappeared at the invasion of the northern barbarians, although they continued till then to be manufactured by local potteries.

Among the northern nations, especially the Celts and Scandinavians, long prior to the Roman conquests of Gaul and Britain, at the remote age of the stone and bronze periods, large and small vases, perhaps originally employed for domestic, but subsequently for mortuary, purposes, are found amongst the cromlechs, the tumuli, and graves of northern Europe. They are formed of a coarse clay, mixed with small pebbles, and have been feebly baked by surrounding them with hay, dried ferns, or other combustible vegetable matters, which have been burned inside and around them. The interior of the walls is black; the exterior, of a pale brown color. Their mouths are large, the ornaments, hatchings, and rude line sometimes making an elaborate pattern or tattooing all over the vase. Those from Britain were called *bascaudæ*, or baskets, by the Romans. A modification of this class of ware was continued under the Saxons and Merovingians, and is distinct from the Gallo-Roman and Romano-British potteries; the clay being better baked, and the ornaments, stamped or impressed from a mold, more regular. The use of pottery among these races was to a great extent superseded by glass, metal, and other substances for drinking and culinary vessels, and few or no specimens of mediæval unglazed vessels are known. Terra-cotta, indeed, continued to be applied for making figures from the 14th to the 18th c. in Europe; but in England even the use of bricks, a manufacture difficult to have been lost, was restored by Alfred. Unglazed ware was, in fact, superseded or abandoned in Europe after the fall of the Roman empire; but in modern times the use of terra-cotta and such like ware is found extended all over Europe, Asia, and Africa, varying in texture and excellence from the coarse flower-pots to the thin and graceful water-bottles of the Arabs and modern Egyptians. Even the Nigritic races continue to manufacture a feebly-baked earthenware, rudely colored with pigments not baked on the ware. In the new world the existence of unglazed earthenware seems to date from the most remote antiquity. The vases and other objects found in the northern portions of America, indeed, are of the rudest kind, and bear a striking resemblance to those of the early Scandinavian, Celtic, and Teutonic graves, in paste, shape, and ornamentation. The Mexican and Peruvian potteries, however, evince a much greater mastery of the art, and both are modeled with great spirit, gayly colored, and profusely ornamented. Some of the oldest Peruvian wares, indeed, rival in their modeling European art, but they never attain to glazing. The other unglazed wares of the new world differ according to the localities where they have been manufactured, and in the most highly-civilized portions reflect or rival the arts of the people by which it has been colonized. Those of the existing native races are very feeble, and the processes are sometimes accompanied by magic ceremonies. The pottery of the southern hemisphere is quite recent, as none of the races seem to have been acquainted with the art. The Fijis, indeed, have a ware glazed with the resin of a tree, but it appears to have been derived from Europe.

The knowledge of glazes originally acquired by the Egyptians and Assyrians was con-

tinued under the Roman empire at Alexandria, and appears to have been transmitted to the Persians, Moors, and Arabs. Faïences, and enameled bricks, and plaques were in use among them in the 12th c., and among the Hindus in the 14th c. A.D. The Moors introduced into Spain the use of glazed tiles about 711 A.D., examples of which, called *azulejos*, as old as the 13th c., are found in the Alhambra. Besides these, the manufacture of glazed or enameled faïences in Spain, distinguished by a metallic iridescence, came into use from the 13th c. in Spain. In Italy they are supposed to have been introduced as early as the conquest of Majorca by the Pisans, 1115 A.D.; but the first appearance of Italian enameled faïence, the precursor of modern porcelain, does not date earlier than about 1420, when it was used for subjects in relief by Lucca della Robbia. About a century later plates and other ware were manufactured at Pisaro and Gubbio, decorated with subjects derived from the compositions of Raphael and Marc Antonio, painted in gay and brilliant colors. But the establishment was abandoned in 1574, although pieces of *majolica* continued to be fabricated in various cities of Italy till the 18th century. From Italy this enameled ware passed into France in 1590 with Catharine de Medici, where it was manufactured till the end of the 17th century. In 1555 the celebrated Palissy discovered at Saintes the art of glazing or enameling a gray paste, and introduced dishes and other objects with fruit, fish, and animals, molded from life, distributed over the surface, as a kind of ornamental ware. At the same time, or earlier, was made what is called Henry II. ware, and which is now so precious, consisting of glazed white ornamental pieces. Glazed or Norman tiles, however, as they are called, date from two centuries before. At the close of the 13th c. glazed ware was made in Alsace; but it was not till two centuries later that *majolica* was fabricated at Nuremberg; and the manufacture was continued in various parts of Germany till the 18th century. Delft, which gave its name to its own fabric, is said to have produced a glazed ware as early as 1360, and continued to do so till the 19th century.

Holland was chiefly celebrated for its bottles of stoneware, glazed by salt, called *bellarmines*, *graybeards*, or *bonifaces*, and for its tankards, which were imported all over Europe, in the 16th c., and are repeatedly found in London excavations. In England glazed tiles for religious purposes were made by the monastic orders from the 12th to the 16th c.; and glazed bottles, jugs, and cups are found of the time of Henry II.; while Edward III. favored the establishment of potteries in England. The English wares, however, were superseded by Delft and Dutch stonewares till the close of the 17th c., when the coarse wares made at Burslem were improved by the discovery of salt and other glazes. Some Germans, named Elers, from Nuremberg, settled there, and produced an improved ware called the red Japanese; but finding that the secret was discovered by Astbury, left for Lambeth, where they established themselves in 1710. From this period various improvements were introduced by Astbury, Booth, and finally by Wedgwood, who discovered more suitable clays in 1759, and called to his assistance the arts of design, by the employment of Flaxman for bas-reliefs and figures. The applications of copper-plate printing and gilding were subsequently discovered. Still later, other materials, as felspar and bones, were used in the composition of this pottery. Delft-stone and other wares were made at different places, as Liverpool, Lowestoft, and elsewhere; but, after different vicissitudes, most of the potteries have disappeared, except those of the stoneware at Lambeth and Vauxhall.

None of this ware, however, was of the nature of the Chinese porcelain which had been imported by the Arabs in the 13th c., was known in Italy in 1330, and was imported into France as early as 1370, and into England much later. The name porcelain, from *porcellana*, an obscure Portuguese word, supposed to mean a shell, is applied to a mixture of alumina or *kaolin* and silice or *petuntse*, which, when baked, does not fuse at a temperature as high as 140° of Wedgwood's pyrometer, and the glaze of which is incapable of being scratched by a knife. This porcelain, called "hard porcelain," is said to have been invented at Sin-ping in China, about 185 B.C., and rose to great importance at King-te-ehin, 557 A.D., where, in 1712, 3,000 furnaces were in activity, and where the manufacture is still carried on. There are about 18 renowned potteries in the empire. The art of pottery in China is said to be as old as 2599 B.C. In Japan, hard porcelain dates from 27 B.C.; translucent porcelain was made about 672 A.D.; but between 1211 and 1221, Kotosiro, a Japanese potter, went to China to improve his process. There are 18 celebrated potteries in Japan; and in modern times, the pieces exported come chiefly from Imali, in the province of Fizen. In 1644, the Dutch exported 44,943 pieces from Japan. At the beginning of the 16th c., the porcelain of China began to be extensively imported into Europe, and various unsuccessful attempts were made to discover the secret of its manufacture, but without success, both as to the material and the process. The Persians, indeed, are said to have produced translucent pottery about the 15th c. A.D.

After some trials, which resulted either in the production of a kind of opaque glass or stoneware, Böttcher or Böttger, an alchemist (who had been seized by Frederick Augustus II. in 1701), after Schnorr, in 1709, had discovered white *kaolin* at Aue, produced from it a white hard porcelain at Meissen, near Dresden; and the porcelain establishment there was founded under royal auspices. Extraordinary precautions were taken to prevent the process being discovered, by imposing oaths upon the workmen, and the process there pursued was not communicated till 1812 to Brongniart. The secret, however, was betrayed by Stöfzel, a workman of Meissen, who fled to Vienna in 1720, where an

imperial establishment was founded, which exists to this day. Other workmen carried the secret from those establishments all over Germany. Royal works were set up at Berlin in 1755, at St. Petersburg in 1744, and at Munich in 1758. From this period, two different kinds of porcelain were made in Europe, a soft and a hard. In France, soft porcelain was made at St. Cloud in 1695, and was not discontinued till 1804. The accidental discovery, by Mme. Darnet, of *kaolin* at St. Yrieix la Perche, in 1765, led to the production of hard porcelain at Sèvres, where, after 1800, only this kind was made. Various places in France made both kinds; and in Italy, both were produced at La Doccia, near Florence, at Capo di Monte, near Naples, and at Venice. Other establishments flourished at Madrid and Oporto, established in the 18th century. The manufacture of soft porcelain appears to have been introduced in England, at Bow, as early as the 17th c., and the Chelsea works were set up still earlier, according to some, by Elers. Thence the art was transferred to Derby in 1748; and an establishment at Worcester, founded in 1751 by Dr. Wall, is said to have first printed on porcelain. Hard porcelain was made by Cookworthy at Plymouth in 1705, and afterward at Bristol, but was subsequently abandoned as unprofitable, although again made by Minton in Staffordshire in 1850. One of the last inventions in porcelain has been the introduction of Parian, or statuary, used for the production of small figures and statues, by Copeland and Minton. Among the oriental nations, the production of porcelain seems limited to China and Japan, although fayences and glazed wares are manufactured all over the east. The production of a white porcelain, either soft or hard, capable of being molded and painted with various colors, effected a revolution in the ceramic art: sculptors were employed to mold small figures and other objects by the different establishments, and the vases, which at first were decorated with rude copies or poor imitations of their Chinese originals, by degrees introduced on their surfaces the art of the country where they were made. The paintings on porcelain thus resembled those on enamel, and when the pieces were of considerable dimensions, and painted by distinguished artists, became of great value. Thus, copies of works of Raphael and of Tintoretto, in the exhibition of 1851, were valued at £1000 and £850. Even ordinary cups, when painted with vignettes, have their value much augmented. So also the application of delicate colors, as blue, green, and rose-pink, added a charm not found in the monochrome glazed ware of the middle ages. For these, Dresden and Sèvres were formerly unrivaled; but the colors of late years have been changed, and do not equal the old. The style of art has varied in each century; the old rococo shapes having been superseded at the commencement of this century by classical shapes, and again by modified mediæval forms. The present age has been distinguished by an attempt to reproduce *majolica*, *palissy*, and other wares; by the improvement of printing in colors; by the invention of statuary porcelain, and an application of the material to other purposes, as buttons, stamped or pressed from a mold or die. Besides the ornamentation of vases, a trade-mark is often added, either stamped in or painted on the ware. This, on the early *majolica*, had the date, place, and name of the artist; but the Dresden, Sèvres, Chelsea, and other establishments introduced devices, monograms, arms, etc., as swords, anchors, crowns, and other devices. The Chinese has devices, mottoes, names of makers, and the date of the reign when made, commencing with the first monarch of the Ming dynasty about 1480, generally in red color, and imitating the seals or stamps used for sealing documents. These marks are continued to the present day.

Manufacture.—The dough-like condition into which clay can be worked with water, and the hardness it may be made to acquire by burning, are qualities which have been turned to account by man from the earliest times, and it is upon these that the potter's art essentially depends; but there is great variety in clay, and it is only by knowing something of its nature and constituents that any real advance has been effected in pottery. If a piece of clay be examined, it will be found that it consists of exceedingly minute particles, held together by aggregation when moist; but if dried it can be easily reduced to an impalpable powder by mere pressure; and if, instead of drying, we add an excess of water, it may be so mixed and held in suspension in the water that it appears almost to be dissolved. In time, however, it is deposited as a sediment, and when the excess of water is removed, it is a soft tenacious paste, which is so non-elastic that it will retain the smallest impression made in it without change. This minute division of its particles, and the absence of elasticity, are its most valuable qualities. But all clays are not of the same purity and quality; the commonest is that of brick fields, which is one of the most abundant substances in nature; but it is so mixed up with iron and other foreign ingredients that, except for bricks, tiles, and the coarsest kinds of pottery, it is not used.

The purest kinds of potter's clay are called *kaolin*, and are believed to have been formed by the decomposition of rocks containing large proportions of feldspar, a slightly variable compound substance, which, in general terms, may be said to be a combination of neutral silicate of alumina and the silicates of potash, soda, lime, or magnesia, together or singly. Certain kinds of granitic rocks, especially the whiter varieties, by their

atmospheric decomposition, yield fine kaolin. Great experience is required in selecting and using the materials, because in nature the plastic materials are very irregularly mixed with other substances, which have a more or less deteriorating effect. Most of the best-known clays contain a certain portion of free silica in addition to that in combination as natural silicate, which requires to be removed for very fine wares by boiling in caustic potash, otherwise, it proves injurious. The finest china-clay of Great Britain is obtained from Cornwall, where the decomposed granite is washed by streams of water, which carry it away into ponds called *catchpools*. The discovery of this source of china-clay was made by Mr. Cookworthy about the middle of last century, and alone afforded means for improving our native pottery, which were most admirably turned to account by Mr. Josiah Wedgwood, and after him, by Mr. Herbert Minton, Mr. Copeland, and others. Previous to this, although as before noticed, fine pottery was made in Britain in two or three places, yet the general character of our pottery, which was chiefly manufactured in the neighborhood of Burslem, in Staffordshire, was most miserable both in material and design. The clay was inferior in color, prepared with very little care, and covered with a coarse white or yellow lead glaze; but the discovery of the Cornish clay by affording a material of excellent quality, stimulated the manufacturers to improve the general style of their manufacture. Scarcely second in importance to this discovery was Wedgwood's good taste and untiring zeal in working out that revolution in the art of the British potter, that has led to its present enormous development. In 1730, when Wedgwood was born at Burslem, in Staffordshire, that place supplied the greater part of the common household pottery of Great Britain; but so small was the trade, that it was but little more than a village encumbered with heaps of broken crockery, and its environs disfigured with clay-pits and piles of refuse; now it is the center of a populous district called "The Potteries," comprising about 48 sq. miles. In this limited space there are now nearly 280 kilns at work, employing more than 100,000 operatives.

The method pursued in making pottery and porcelain is the same in principle everywhere; we shall, therefore, give the general outline of the process without entering into the minute differences which distinguish the variations produced by different manufacturers in this and other countries. Pottery and porcelain differ chiefly in this, that the superior quality of the materials used in making the latter, gives it a peculiar translucency. For pottery, inferior materials are used, and a considerable admixture of calcined flint, bone-ashes, or native phosphate of lime, are added to the clay. The use of the calcined flint was said to have been first adopted by a Burslem potter named Astbury, who, while traveling to London on horseback, in the year 1720, had occasion in passing through Dunstable, to seek the assistance of a hostler in consequence of some disease in his horse's eyes. He noticed that the man took a piece of flint, burned it, and then reduced it to a fine powder, which he blew into the horse's eyes. Astbury noticing the beautiful whiteness of the powder, conceived the idea of using it in his pottery; and did so with great success.

The ingredients, such as the clay and calcined flints, are ground by separate means; the former in the pug-mill. This is an upright, iron-bound, wooden cylinder, with an axis turned by machinery; projecting from the axis are 7 arms, each of which has 3 knives fixed in it, with the points outward, and so arranged that they spread over the largest amount of space in the interior; and altogether they are placed in a spiral manner, so that when in motion, the clay which is thrown in lumps into the hopper-shaped upper part of the vat, is worked down, and is so cut and kneaded by the knives that it is forced out at an opening at the bottom, in the state of soft pap. This is aided by the knives on the lower part of the lowest arm being connected together by a plate, which prevents all settlement at the bottom. This pap-like clay passes into a large wooden tank, in which it is agitated with water until quite incorporated so as to resemble milk in color and consistency. In another mill, of a different construction, the Cornish granite and calcined flints are being reduced to a somewhat similar state. This mill is very strongly constructed, and consists of a tub-like vat, in the center of which turns an axle moved by machinery; in the bottom of the vat is a thick stone-bed, consisting either of chert or horn stone. From the upper part of the axis 3 strong arms project like the spokes of a wheel; and strongly attached to these are stout beams pointing downward, and nearly touching the stone-bed. As the axis, with its arms and beams, turns round, the beams push some large masses of the Cornish granite or of chert stone round with them, and these triturate the calcined flints and other hard materials, and stir up the water with which the vat is kept constantly supplied, while it overflows in a milky state, charged with the finely divided materials, into a cistern, where it is kept stirred until it is sufficiently supplied with the solid materials, and the thickened milky liquid is then drawn off, in proper proportions, into a vat to which the prepared clay is also passed. The mixture of the two is then allowed to subside until the water is nearly clear, when it is drawn off; and the sediment is deprived of its surplus moisture, either by evaporation, or, in the best works, by a pneumatic-exhausting apparatus, which does it very quickly. The composition is then a fine plastic material of the consistency of tough dough, and is ready for the potter's use. In preparing the finer materials for porcelain many other operations are required, all, however, having the same object, viz., the extremely minute division of the substances used.

The prepared clay is taken to the *throwing-machine*, or *potter's lathe*, which is repre-

sented in fig. 1. This consists of a fixed table A, through which passes the axle B; and

FIG. 1.

shape he pleases; his management of this requires considerable skill, as nearly every article requires a different configuration. But some articles are formed in molds, the molds being made of plaster of Paris. This answers well for fine porcelain intended to be very thin, because the plaster-mold absorbs much of the moisture in the paste, and thus partially dries it, so that it admits of handling, which in a softer state would be very difficult. The paste is used so liquid that it can be poured into the molds. It is usual, in casting, to have a mold for each part.

FIG. 2.

For nearly flat articles, such as dinner-plates, a plan is adopted which combines both processes: a mold, usually of plaster, Fig. 2, *a*, is placed on the disk of the throwing-wheel, *b*, and a thin layer of the paste is pressed on to it, so as completely to take its form; then to the guide-post, *c*, is attached an arm, *d*, with a small brass plate, *e*, on its lower side. This plate is cut to the outline of half the plate, or dish; as it revolves, this pares down and shapes the clay to its own outline, and to the thickness to which it is set, there being an arrangement on the arm of the guide-post by which this can be effected. Sometimes, as in the case of deep vessels, molds are used for the exterior, and the interior is formed by the hand. This process insures certainty of size and shape, which is important in making large numbers of similar articles, as tea-cups, etc. The mold is lined with a thin cake of clay, and when placed on the revolving disk, it is fashioned inside by hand, and finished off with a wet sponge. Sometimes metal or horn tools are used for producing moldings and other raised ornaments, or for grooves, when the turning or throwing wheel is used. If the articles made require handles or other similar accessory parts, they are always molded, unless of very simple forms, and are attached whilst they and the body are still soft enough. They are joined by a thin fluid paste called a *slip*, and the junction is smoothed over with the wet sponge, which is one of the most useful of the potter's tools. Being formed, the articles, of whatever kind, are now taken to the drying-stove, where they are placed on shelves, and remain there some time, exposed to a heat of about 85° Fahr. When quite dry, they are next taken to a workshop near the kiln, and they are here carefully packed in coarse earthenware vessels, called *seggars*, which are so made that they can be piled upon one another to a great height in the kiln, as seen in fig. 3, in which some of the seggars are seen in section, for the purpose of making the arrangement more intelligible. As the seggars are generally made large enough to hold a number of articles, which would, when highly heated, adhere if they touched, a number of curiously-shaped pieces of burned clay are used for placing between them, so as to make them rest on points; these are called *watches*, *cock-spurs*, *triangles*, *stilts*, etc. Another object is gained by this, in burning flat articles such as plates: these, if placed one upon another, would not be fired equally; but, when they are held apart, the heat affects all parts alike. The seggars are so piled in the kiln that the center is hollow, and there are free spaces between them through which the fire can ascend: props, *a, a, a*, fig. 3, being so placed as to keep them from immediate contact with the sides all round. Thus each seggar forms a small oven, in which one or more pieces of pottery or porcelain are baked, and the seggars prevent any unequal heating of the pieces, and also protect them from smoke. A kiln has generally eight furnaces, and it is usual to raise six piles of seggars between every two furnaces, or rather between their flues, which rise to a considerable height in the kilns. Each pile of seggars is technically called a *bung*, so that there are generally 48 or 50

bungs to the charge of a kiln. When all this is arranged, the furnaces are lighted, and great care is taken to have the best coal, as it enables the manufacturer to make a more certain calculation as to its effects, and is less liable to smoke and sulphureous vapors, which might injuriously affect the contents of the kiln. The baking or firing requires great care and attention, and there are many nice regulations connected with it to guide the workmen. It usually lasts from 40 to 42 hours. The fire is then allowed to go out, and the kiln to cool very gradually, after which it is opened and the seggars removed, to be unpacked in a separate workshop. The articles are now in the state called biscuit-ware, and require both the glaze and any patterns they may be intended to bear. Common pottery is often figured by printing the design in enamel colors on paper, and whilst the printing is still wet, applying it to the biscuit-ware; the ware absorbs the enamel ink, and the paper is removed by water, leaving the pattern on the ware. It is then fired in seggars, or a muffle, to fix the color, and is then dipped into composition called *glaze*, of which three kinds are used in the Staffordshire potteries. The first, for common pipe-clay ware, is composed of Cornish granite, 16 parts; flint, 36 parts; white-lead, 53 parts; and cullet, or broken flint-glass, 4 parts. These materials are triturated with water, with the same care and by similar means to those employed in forming paste, and are reduced with water to the same milk-like liquidity. Each workman has a tub of the glaze before him; and as the articles of biscuit-ware, either with or without decorations, are brought to him, he dips them in the glaze, so as to insure a uniform coating over them; and, by nice management, he prevents any large drops or accumulations on one part more than another. The porous biscuit-ware rapidly absorbs the moisture, and dries up the thin film of glaze on the surface of the articles, which are again placed in seggars, and carried to the glaze-kiln, where they undergo another firing, which melts the glaze, and converts it into a perfectly transparent glass, like water, all over the surface, and renders any pattern previously printed upon it very plain. The temperature in the glaze or enamel kiln is only increased very gradually, and is kept up for about fourteen hours, after which it is allowed to cool slowly, and the articles are taken out completed. So far, this description has applied to the manufacture of pottery and porcelain on a large scale, for general purposes; but when it is applied to more costly and artistic works, very special arrangements are required: and in the case of remarkably fine pieces, instead of the huge kilns, which hold frequently many thousand pieces, muffle furnaces are both used for the biscuit, the glaze, and the colored and gilded decorations, which, in porcelain, are applied on the glaze, and not on the biscuit.

The decoration of porcelain has long held a high rank as a fine art; and the exquisite skill shown in some of the finest works of the continental manufactures, and lately in those of Britain, has fairly entitled it to that rank. The colors employed are all colored glasses ground to impalpable powders, and mixed with borax or some other fluxing material; for use they are generally made liquid with oil of spike, and they are laid on with hair-pencils in the same way as oil-colors. The whole process is exactly the same as in painting or staining glass; the glaze on the biscuit-porcelain being true glass, and the enamel colors being exactly the same as those used by the glass decorator. The colors may be made by mixing the materials of which glass is made with the coloring material and the flux, or simply with the already colored glass and the flux. When the former plan is employed, the following are the coloring materials employed: oxide of chromium for green; oxide of iron for red, brown, violet, gray, and yellow; oxide of uranium for orange, yellow, black; oxide of manganese for violet, brown, black, and purple; oxide of cobalt for blue, gray, and black; oxide of antimony for yellow; oxide

FIG. 3.

of titanium for yellow; oxide of copper for green; suboxide of copper for red; sesquioxide of iridium for fine black; protochromate of iron for brown; chromate of lead for yellow; chromate of barytes for yellow; chloride of silver for deepening reds and purples; purple of cassius for ruby and purple. Several of these colors are much increased in brilliancy by the addition of oxide of zinc, which of itself gives no color, and the transparent ones are rendered opaque by the addition of oxide of tin.

Other fluxes besides borax, or borate of soda, are used, as sand, feldspar, boracic acid, minium or litharge, salt, saltpeter, potash, and soda. Nothing enriches the appearance of porcelain more than good gilding; for this purpose gold-leaf is rubbed down with oil of turpentine, or pulverulent gold is produced by precipitating a solution of gold in aqua-regia, by the addition of a solution of sulphate of iron. The gold is precipitated as a brown powder, which is washed and dried, and then worked up with one-sixteenth of its weight of oxide of bismuth and oil of turpentine. It is painted on, then fired, and afterward burnished. Peculiar and beautiful metallic lusters are produced upon pottery by precipitated platinum and other means; but it is not within the scope of this article to enter into all the details by which the almost numberless variations are produced in the manufacture and decoration of this material. The literature relating to its history is rich in treatises for the guidance of those engaged in the art.

The following are the chief varieties of ceramic materials and their usual composition: 1. *Porcelain*.—At Sèvres, kaolin, 48 parts; sand (pure white), 48 parts; chalk, 4 parts. At Dresden, kaolin, 62 parts; feldspar, 26 parts; broken biscuit-porcelain, 2 parts. At Berlin, kaolin, 76 parts; feldspar, 24 parts. In England three mixtures are used: For common china, ground flints, 75 parts; calcined bones, 180 parts; china-clay, 40 parts; clay, 70 parts. For fine china, ground flints, 66 parts; calcined bones, 100 parts; china-clay, 96 parts; Cornish granite, 80 parts. Fine, for modeling figures, etc., Lynn sand, 150 parts; calcined bones, 300 parts; china-clay, 100 parts; potash, 107 parts. The glaze requires to be varied for nearly all, so that their fusibility may be greater or less, according to the more or less fusible character of the biscuit ingredients. 2. *Parian*.—The composition for this is the same as that for the fine English china, but it is used in a liquid state, so as to be poured into the plaster of Paris molds. It requires very great care in the firing. 3. *Earthenware* (Fr. *Faïence*, from *Fayenza*, the name of a place in Italy where it was made; Dutch, *Delft*, from its having been chiefly made at Delft, in Holland).—Made of various kinds of clay, varying in color from yellow to white, according to the quality required; and more or less of powdered calcined flints are mixed with it to give it body and hardness. Sometimes, as in porous vessels, only clay is used. 4. *Stoneware*, such as is used for jars, bottles, drain-pipes, etc., is made of several kinds of plastic clay, mixed with felspar and sand, and occasionally a little lime, but the materials vary much in different localities.

In Great Britain the potteries not only supply the home demand, but also export to a greater extent than any others in Europe; and so rapid and extensive have been the improvements effected in the last ten years by British potters, that both as a manufacturing and as an artistic country Great Britain now stands foremost. In 1875 the exports of earthen and china ware, parian and porcelain (except red pottery and brown stoneware) amounted in value to £1,745,078. The largest quantities are sent to India, North America, and Australia. In North America, however, the manufacture of pottery is carried on with great activity in Jersey City, Philadelphia, Liverpool (in Ohio), and other places.

Most of the celebrated manufacturers of pottery and porcelain, both at home and abroad, have employed a special mark to distinguish their works, and these are now of considerable importance in enabling us to ascertain the origin of choice specimens.

POTTINGER, Sir HENRY, 1789-1856; b. Ireland; went to India in 1804 as a cadet in the Bombay service; was employed for 7 years as judge and collector at Ahmednuggur in the Deccan, and political resident the following 15 years at Cutch and Scinde. In 1840, returning to England, he received a baronetage; and in 1841, war having broken out between England and China, was sent to China as ambassador extraordinary and minister plenipotentiary to settle the differences in regard to the opium trade, and as superintendent of British trade. He concerted measures with admiral Parker, the result of which was the taking of Amoy and other important places, and the concluding of a peace which opened the great ports to all nations. For these services he was made a knight grand cross of the order of the Bath in 1841. In 1843 he was made governor and commander-in-chief of Hong-Kong, and on his return to England in 1844 the office of privy councilor and a pension of £1500 were conferred upon him. In 1846-47 he was governor of the cape of Good Hope. In 1848 he was governor and commander-in-chief of Madras until 1854. He died at Malta.

POTTO. See KINKAJOU.

POTTS, GEORGE. D.D., 1802-64; b. Philadelphia; graduated at the university of Pennsylvania, 1819; studied theology at Princeton; ordained as an evangelist, 1823; pastor of the Presbyterian church at Natchez, Miss., 1823-35; of Duane Street church, New York, 1836-44; and of University Place church, 1845-64. He was an eminent preacher of commanding presence, oratorical manner, flowing style and practical aim. Though drawn into a controversy with Dr. Wainwright by the pamphlet entitled *No*

Church without a Bishop, he was always kind and fraternal in his deportment toward Christians of all denominations. He published numerous sermons and addresses.

POTT'S DISEASE, an affection of the spinal column named after Dr. Percival Pott (q. v.), the surgeon who first accurately described its condition and nature. The disease is otherwise called *angular curvature of the spine*. It is caused by inflammation of the bodies of the vertebrae and of the intervertebral substance, usually commencing in the latter. It is commonly regarded as essentially a scrofulous disease, and it is often attended by development of tubercle in the affected part, accompanied by caries of the bony substance of the vertebrae, the giving way of which causes the curvature of the column. Its most common period of development is childhood and youth, while the body is growing. Spinal abscess, or the formation of pus at the seat of disease and its appearance further down in the groin and thigh, is a common occurrence, although recovery sometimes takes place without the formation of pus. Sometimes the pus finds its way beneath the fascia of the psoas muscle, constituting *psoas abscess*. Sometimes the whole thigh becomes involved by the burrowing of the pus between and beneath the muscles. Sometimes the abscess points in the loins, when it is called *lumbar abscess*. When the disease is located in the cervical vertebrae the abscess points in the pharynx. When recovery takes place there is always ankylosis, caused by the union of the bony tissue of contiguous vertebrae. General constitutional measures form a large element in the treatment, those remedies which are adapted to the treatment of scrofula, consumption, and debility being especially appropriate. Attention to hygiene is of the greatest importance. The diet should be nutritious and easily digestible. As much exercise in the open air as is consistent with the condition of the patient, with bathing, rubbing, and general tonics. The mechanical surgical treatment consists in the application of apparatus calculated to sustain the form of the body, prevent attrition between the bones, and relieve irritation generally, the success of which depends upon the ingenuity and skill of the surgeon.

POTTSTOWN, a borough of Montgomery co., Penn., 35 m. from Philadelphia; on the Philadelphia and Reading railroad; pop. '70, 4,215. The town is amid picturesque scenery, and is the center of a fertile agricultural region. Coal and iron are found in great quantities in the neighborhood. The chief industries are connected with the rolling-mills, furnaces, the great Pottstown iron company, and the railroad repair shops.

POTTSVILLE, a city of Pennsylvania, on the Schuylkill river, at the entrance of Norwegian creek, 93 m. n. w. of Philadelphia, with which it is connected by railway. It is in the midst of a rich anthracite coal and iron region, and has several iron foundries, a brass foundry; manufactures of iron safes, sashes, and wood-work; county buildings; 10 banks; 3 English, 3 German, and 1 Welsh paper; and 19 churches, 3 of which are Welsh. Pop. '70, 12,384.

POT-WALLERS, or **POT-WALLOPERS** (from *pot*, and old English *wall*, to boil or bubble), the popular designation of a class of electors forming the constituency of various English boroughs—as Ilchester, Honiton, Tregoney, Old Sarum—before the reform act of 1832, whose qualification as housekeepers was considered to be established by their boiling a pot within the limits of the borough over a fireplace erected in the open air. The doing so was regarded as evidence that the elector was in circumstances to provide for his own subsistence, and not necessitated to apply for parochial relief.

POTY, a district t. and rising sea-port of Russia, in the Caucasian government of Kutais, stands at the mouth of the river Rion, on the eastern shore of the Black sea. The Rion connects the port with the interior, and since the establishment of regular steam communication by the Russian trade and navigation company in this quarter, the commerce and especially the transit-trade of this town has greatly increased. It is connected by railway with Tiflis. Pop. '67, 1309.

POUCH, **MILITARY**, a stout leather box, black or brown, lined with tin, covered with a strong flap, and ornamented with the device of the regiment, serves to carry the cartridges required by a soldier for immediate use. When cartridges are supplied for a whole day's service, two pouches are worn, one on the front point of the hip, and a larger one on a belt suspended over the left shoulder.

POUCHED RAT, *Pseudostoma*, a genus of *muride*, of which there are several species, natives of parts of North America w. of the Mississippi, and some of them very troublesome from the ravages they commit in fields and gardens. They have four molars on each side in each jaw. The tail is short. The cheeks are furnished with pouches, to which the name refers, the openings of which are from the outside, and not from the mouth. The pouched rats burrow in the ground, and do great mischief to root-crops.

POUCHET, **FELIX ARCHIMEDE**, 1800-72; b. at Rouen; took his medical degree in Paris, and became in 1828 professor at the museum of natural history in Rouen, and director of that institution, and in 1838 professor at the medical school there. He invented an aëroscope and proposed a theory of spontaneous ovulation, often designated as Pouchet's laws. He published 80 volumes, the principal of which are *Théorie Positive De l'Ovulation Spontanée et de la Fécondation des Mammifères et de l'Espèce Humaine*, for which he received from the academy the prize of 10,000 francs; *Histoire des Sciences Naturelles au moyen âge; Hétérogénéité; ou Traité de la Génération Spontanée; L'Univers les Infiniment Grands et les Infiniment Petits*. The last work has been translated into English.

"His works," says the *Nouvelle Biographie Générale*, "are distinguished for scrupulous accuracy. His experiments on spontaneous generation in opposition to those of M. Pasteur, had a great celebrity in the scientific world."

POUGHKEEPSIE, a city of New York, on the e. bank of the Hudson river, 75 m. n. of New York, finely situated on a table-land, about 200 ft. above the river. The city has broad and handsome streets, with fine public and private edifices. The collegiate school is situated on an eminence which rises 500 ft. above the river, and from which a magnificent prospect, embracing an area 2,500 sq.m. in extent may be obtained. Poughkeepsie contains a city-hall, academy, law-school, lyceum, orphan asylum, 6 public schools, an endowed female college, a rural cemetery, 6 banks, extensive iron-works; carriage, chair, and carpet factories; breweries, 21 churches, and has railway and steam-boat communication with New York and Albany. Poughkeepsie was settled by the Dutch in 1690; during the revolution it was the state capital, and the convention met here, 1788, to ratify the constitution of the United States. Pop. in '70, 20,080.

POUGHKEEPSIE (*ante*), the co. seat of Dutchess co., on the Hudson river, and the Poughkeepsie and Eastern railroads; pop. '80, 20,207. It is regularly laid out; the streets are shaded and lighted with gas; and there are many handsome public and private buildings. Two m. n. of the city are the buildings of the Hudson river state hospital for the insane, built 1867-71 at a cost of about \$750,000. Vassar college, for women, is about 2 m. e. of Poughkeepsie by horse-cars. The principal building, modeled after the Tuileries, is 506 ft. long, 5 stories high, and contains 242 bedrooms and 100 parlors, with recitation rooms, a chapel, library, laboratories, etc. The college has also an observatory, art museum, and gymnasium. The mineral cabinets are large. The art gallery has one of the best collections of water colors in America. The observatory has a large equatorial reflector. The college was founded in 1861 by Matthew Vassar, who endowed it with \$400,000, and afterward made it large gifts. The number of students is about 400. Poughkeepsie is noted for the number of its educational institutions, among which, besides Vassar college, are the Poughkeepsie collegiate institute, the military institute, Cottage Hill seminary, St. Peter's academy, the Poughkeepsie female academy, Riverview military academy, and Eastman's national business college. It is connected with New Paltz, opposite, by steam ferry. The city has a considerable trade with the rest of the county. The manufacturing industries are large, including rolling-mills, furnaces, ship-yards, tanneries, foundries, coopers' shops, boot and shoe factories, etc. It has been for some time in contemplation to put a bridge across the Hudson at this point, at an estimated cost of \$2,600,000. Over this it is proposed to run a railroad connecting Boston with the Erie railroad and the west.—The state legislature met here during the invasion, 1777-78, and assented to the articles of confederation.

POUILLET, CLAUDE SERVAIS MATHIAS, 1791-1868; a French physician; educated in Paris; became professor in 1827, director in the conservatory of arts and trades in 1832; in 1838 professor of physic at Sorbonne, and as a lecturer distinguished by the elegance of his diction and his power to make scientific studies interesting and instructive to unscientific people. He was the inventor of instruments for measuring the varying compressibility of gases; the originator of a theory of the sun's heat, and of an instrument by which it is measured, called the *pyrhéliometer*; and of experimental demonstrations of the laws of electric currents. His principal work has been abridged for the use of schools under the title of *Notions Générales de Physique et de Météorologie à l'usage de la jeunesse*. His works are numerous, and embrace memoirs on the voltaic pile, the source of thermo and hydro-electricity, the elasticity of fluids, the latent heat of vapors, measures of extreme heat and cold, the height, speed, and direction of clouds, and the use of photography in determining them.

POUJOLAT, JEAN JOSEPH FRANÇOIS, 1808-80; b France; co-laborer with the elder Michaud upon the *Bibliothèque des Croisades*, and traveler with him through European and Asiatic Turkey in the study of the scenes of the crusades. On their return they published in 1832-35 the *Correspondence d'Orient*. An ardent royalist, and bitterly opposed to the irregular advent of Louis Philippe to the throne in 1830, he made himself felt in politics through contributions to the *Quotidienne*. Having cultivated the fear of republics among the middle-classes of France, he helped prepare the ground for the *coup d'état* of Napoleon in 1851; but made as determined war upon the new government as upon that of Louis Philippe, through the columns of the *Union*, the *Revue des Deux Mondes*, and other journals. His *Histoire de Jérusalem*, a religious and philosophical picture, was crowned by the academy in 1840-42; also *Histoire de St. Augustin*, 1844. In 1863 he published a review of Réan's *Life of Jesus*. He has been a prolific author of works mostly on religious history and its current discussions.

POULPE, *Octopus*, a genus of *cephalopoda* (q.v.) of the order *dibranchiata*; having eight feet or arms, nearly equal, united at the base by a membrane, and very long in proportion to the body. There is no shell, but it is represented by two small grains of horny substance imbedded in the back, one on each side. The arms are used for swimming in water, creeping on land, and seizing prey. Poulpes swim by contractions of the muscular web of the body, which extends upon the arms. They creep on shore in a

spider-like manner, with sprawling arms. Like other cephalopods, when alarmed or annoyed, they discharge an inky fluid. One species (*O. vulgaris*) is occasionally found on the British shores, and is more common on the southern shores of Europe, and elsewhere in the Mediterranean. It is the *polyptus* of the ancients. Its arms are six times as long as its body, and each furnished with 120 pairs of suckers. See CEPHALOPODA. In warmer seas very large species occur; and although the stories related of their laying hold of and swamping boats, seizing and killing swimmers, etc., may probably be fabulous, yet it is certain that some of them have arms at least 2 ft. long, and there is probable reason to suppose that much larger species exist, which must be powerful and dangerous creatures. A poulpe, with its eyes fixed on its adversary, and its beak threatening to approach, must have a sufficiently formidable aspect. It was no doubt a poulpe which Mr. Beale encountered on the shore of the Bonin islands, which he attempted to intercept in its retreat toward the sea, and which turned and fastened upon him, laying hold of him with its arms, and trying to bite him with its parrot-like beak.— See *The Octopus*, by Henry Lee (1875).

POULSON, ZACHARIAH, 1761-1844; b. Philadelphia; edited and published *The American Daily Advertiser*, 1800-39, the first daily in the country. He was state printer for some years, and the publisher of *Poulson's Town and Country Almanac*, 1789-1801. He also published Proud's *History of Pennsylvania*, 1797-98. He was a member of several literary and charitable associations, and connected with the library company of Philadelphia for 58 years.

POULTICE. See CATAPLASM.

POULTRY (Fr. *poule*, a hen), a collective name for useful domesticated birds. It is sometimes limited to the domesticated gallinaceous birds, but ordinary use includes all the birds reared for economical purposes. These belong exclusively to two orders of birds, the *gallinaceous* and *palmiped*; the common fowl, pea-fowl, Guinea-fowl, turkey, guan, and pigeon belonging to the former; and the different kinds of duck and goose, as well as the swan, to the latter. For what relates to the different species and their varieties, we refer to these heads; devoting this article to some general remarks as to the management of poultry.

In general, the rearing of poultry is regarded as a very subordinate branch of rural economy, and it is pursued chiefly where agriculture is in a somewhat primitive state, the skillful and enterprising farmer deeming it beneath his attention, or finding that he has not time to attend to it, and often looking on the feathered inmates of his farm-yard almost as a nuisance because of their invasions of his fields. It may pretty safely be asserted that there is no good reason for this, and that poultry properly cared for would always be found a source of profit. The farm-yard affords great advantages for the keeping of poultry, and the increasing demand of the market promises a sure return. In some parts of Britain and in Ireland, where the farms are small, poultry are very extensively kept by farmers and cottagers; but the n. of France and Pomerania exceed all other parts of Europe in poultry-keeping, which there is not unfrequently the leading object of husbandry, and the traffic in the products of the poultry-yard is on a truly great scale.

There is very commonly no building erected for the special accommodation of poultry; but perches and places for nests are provided for them in a cow-house or some other farm-building; or, in very many cases, when kept by cottagers, they roost on joists of the roof, within the door of the cottage itself. In such cases, they roam at liberty during the whole day, and find much of their food in the fields and on the road sides, although the feeding of them with corn and other food is not neglected by the careful housewife. But it is often undesirable, for the sake of fields or gardens, that so much liberty should be allowed to poultry, and they may be very advantageously kept either wholly or mostly in confinement. If circumstances permit, it is good for them to be let out for an hour or two daily into a grass field, but it is not necessary if they are provided with a warm, clean, and well-ventilated house, to which a spacious open court is attached, and are regularly supplied with abundance of food, water, sand, or fine ashes, lime, and small stones, all requisites to their healthful existence. The food must also be of various kinds. Poultry must have supplies of grain or pulse, and of soft food made of the meal of grain or pulse: the kind may depend upon convenience and cheapness; and instead of such food, boiled potatoes may to some extent be used. *Bran* is a very good article of food for poultry. But the same food, without variation, should not be given for any considerable time. And it is indispensable that all kinds of poultry be frequently, if not even daily, supplied with green food, as blades of kale, cabbage, cauliflower, turnips, etc., or lettuces, cresses, chickweed, sow-thistle, etc. It is pretty safe to observe the kinds which they like, and to allow them to choose for themselves. When they have no opportunity of seeking worms, snails, slugs, and insects for themselves, animal food must be given, and the refuse of the kitchen cannot be more profitably employed. It is possible at some seasons to give too much food, making the poultry too fat, and diminishing the production of eggs; but at other times, as during the season of molting, food cannot be given too plentifully. Water must at all times be abundantly supplied.

Poultry-houses may be built of any material that is most convenient; but warmth

cannot be too much regarded. A poultry-house of 4 ft. square should have a yard at least 8 ft. by 4. The yard is inclosed by wire-netting. The floor of the house, made of clay or other material, ought to be so firm and hard as to admit of its being easily swept, and this should be often done. The house is provided with roosting places on the ground or above it, according to the kind of poultry, and with nests for laying in. Hatching ought to be conducted in a separate place. The court should be furnished with a "lean-to" shed on one side, under which the birds may find shelter from sun or rain, and here they should find sand or fine ashes to fling over themselves, according to their manner, to rid themselves of insect tormentors. Lime is also necessary for them, large quantities of it being used to make egg-shells, besides what the animal system otherwise requires. It may be very conveniently supplied in the form of lime rubbish from old walls, in which also occur in abundance such small stones as birds need in order to the trituration of the food in their gizzard.

In the places appropriated to hatching, it is good to have a fresh turf deposited, to prevent the eggs from becoming too dry, and it is even recommended that the eggs should be slightly moistened every day. It is said that the inner membrane of the egg is otherwise apt to become hard, so that the young chick cannot break through it.

Where purity of breed is of importance, as when fowls are to be exhibited in prize competitions, great care must be taken to keep the different kinds perfectly separate; otherwise, intermixture to a certain extent is not undesirable. It is always, indeed, to be desired that each good kind be kept pure and in as great perfection as possible, for improvement of the stock. But even in a small poultry-house, it is desirable to have different kinds, some being particularly estimable for their flesh, some for the abundance and quality of their eggs, some for their disposition to incubate, etc. For web-footed birds, free access to water is required; but some of the kinds are well enough provided for by a pretty capacious trough.

Among the diseases of poultry, *gapes* (q.v.) is one which very frequently demands attention, particularly in young chickens. *Pip* or *roup* is another. Some of the maladies which cut off great numbers of young chickens, and still more of turkey-poult, may be in a great measure prevented by supplying abundance of nourishing and sufficiently varied food, with water and lime; and by preventing the young birds, particularly turkeys, from getting among wet grass.

It is sometimes taken for granted by writers on this subject, that all the birds which can be domesticated with advantage, have already been domesticated. The assumption is quite gratuitous, and it might as well be asserted that improvement has reached its utmost in any other direction. The concurrent supposition that the common domesticated kinds were given to man at first as domestic, is likewise unsupported by evidence, although the domestication of some of our poultry birds must be referred to a very early date. Among the *anatide*, some progress has recently been made in the domestication of new kinds; and a beginning may even be said to have been made as to some additional gallinaceous birds.

Much valuable information on the management of poultry will be found in the *Hen-Wife, Her own Experience in Her own Poultry-Yard*, by Mrs. Fergusson Blair of Balthayock (Edin. 2d ed. 1861).

POUNCE, powdered resin, or some gum resin such as mastic, sandarach, or copal, and also the powder of cuttle-fish bones. It is used for sprinkling over freshly written writing, to prevent blotting; fine sand is often substituted for pounce. Blotting-paper has almost superseded the use of pounce in Great Britain.

POUND, in English law, means an inclosure, of which there was generally one in every parish, or at least every manor, in which stray cattle were put and detained until the damage done by them was paid for. Whenever a stranger's or neighbor's cattle trespass on another's lands, the latter can seize them, and take them to the pound, or impound them, as it is called, *damage feasant*, and can keep them there till the expenses are repaid. There was a distinction between pound overt, or common pound, and pound covert, or close pound: in the former case, the owner of the beasts could go and feed and water his cattle while impounded, and it was his duty to do so; but not in the latter case. Now, it is compulsory for the impounder, in all cases, to supply the cattle with food, otherwise he incurs a penalty; and if impounded cattle are not sufficiently fed, a stranger who feeds them may not only trespass on lands to do so, but can recover the costs from the owner of the beasts. This was formerly an important head of law, and it is not obsolete, for the power to impound stray cattle still exists, though common pounds are disappearing, for, in point of law, they are not necessary, since the impounder can put the cattle in his own stable or field.

POUND (Sax. *pund*, Ger. *pfund*, Lat. *pondus*, "weight"), the unit of weight in the western and central states of Europe, differing, however, in value in all of them. The symbol (*lb.*) for it is equally general, and is derived from the Latin word *libra*. The old English pound, which is said to have been the standard of weight from the time of William the conqueror till that of Henry VII., was derived from the weight of 7,680 grains of wheat, all taken from the middle of the ear, and well dried. After this time, the *troy* pound, which was heavier by $\frac{1}{8}$ than the old English pound, became the standard, but it was divided into only 5,760 grains. Henry VIII. introduced the *avoir-*

dupois pound for weighing butcher meat in the market, and it gradually came to be used for all coarse goods in frequent demand; it contained 7,000 troy grains. The troy and avoirdupois pounds, both legal measures, continued in regular use from this period—the former being gradually appropriated by jewelers and apothecaries; and, to prevent variation, a brass weight of one pound troy was constructed in 1758, and placed in charge of the clerk of the house of commons. This weight, in 1824, was declared by act of parliament to be “the original and genuine standard measure of weight,” and that from which the value of the ounce, grain, pound avoirdupois, etc., were to be deduced, but being, along with the standards of measure, destroyed in 1834, a commission was appointed to consider the best means of replacing them. After long deliberation, hearing of evidence, and sifting of suggestions, it was agreed, *inter alia*, that the standard of weight should be a piece of platinum, weighing 7,000 grains (an avoirdupois pound), but that this piece should not be defined with reference to any natural standard. The troy pound thus ceased to be the standard, but its use was allowed to jewelers and (differently divided and subdivided) to apothecaries.

The pound-weight of silver, a common money standard among the ancient Romans, was introduced by them into the countries they conquered, and thus the term “pound” became a designation of a certain amount of coined money. Thus, nowadays, the English pound is considered as something (a coin or otherwise) equivalent to 20 shillings, but originally it denoted the pound of silver which was coined into 20 shillings. From Edward II.'s time, the coins were more and more diminished in size, the monarch coining 25 shillings from a pound of silver; while from the same weight of bullion his various successors coined 30, 45, 48, 96, 144, 288, in the time of Elizabeth 60, and (during the reigns of her successors) 62 shillings. George I. coined 66 shillings to the pound of silver, and this rate still continues, the term “pound” having been completely severed from its original meaning, and appropriated to signify 20 shillings of the present coinage.

POUNDER, the term used in describing the force of a cannon employed in firing solid shot, as a “9-pounder field gun,” a “300-pounder Armstrong,” etc. See CALIBER.

POUSSIN, GASPARD, a celebrated landscape painter, was the son of a Frenchman, settled in Rome, and was born there in 1613. He was the pupil of Nicolas Poussin, who had married his sister, and from respect to that great artist, adopted his name in place of his own, which was Dughet. He was called by the Italians Gasparo Duche, and he inscribed his etchings, eight in number, in that way. His landscapes are composed in general from studies in the Campagna of Rome and surrounding country, worked out with the feeling of a mind deeply imbued with classical associations, and tending toward melancholy reflection, by contrasting the glory of the past with the decadence of the present—ideas entirely the opposite of these of Claude, who, trusting to the never-fading beauty of nature, endeavored, from the scenery and architectural remains in Italy, to realize the classic age in all its glory. The national gallery possesses six specimens of Poussin, some of them being reckoned masterpieces, as the “Sacrifice of Isaac,” a “Land Storm,” and an “Italian Landscape, with a View of a Town.” Poussin died in Rome, 1675.

POUSSIN, NICOLAS, a painter of great celebrity, born near Le Grand-Andely, in Normandy, in 1593 or 1594; was first a pupil of Quintin Varin, then painting pictures for the church of Grand-Andely; but at the age of 18 went to Paris, studied under Ferdinand Elle, the Fleming, Lallemand, and others; but chiefly improved himself by drawing from casts, and drawings and prints after Raphael and Julio Romano, in the collection of M. Courtois, who accorded him access to them. After a long and hard struggle, he attained the object of his desire—namely, the means of visiting Rome. He was 30 years of age when he arrived there, and a considerable period elapsed after that before he obtained much employment. At length, however, he received several important commissions from the cardinal Barberini, which he executed so successfully that he afterward rapidly acquired fame and fortune. After an absence of 16 years, he returned to Paris with M. de Chantelou, and was introduced by cardinal Richelieu to Louis XIII., who appointed him his painter in ordinary, with apartments in the Tuileries, and a salary of £120 a year. Poussin returned to Rome for the purpose of giving up his establishment there, and taking his wife to Paris; but while he was occupied with these arrangements, Louis XIII. having died, he gave up all thoughts of returning to his native country, remained in Rome, and after a very successful career, died in 1665. His reputation mainly rests on his success in aiming at the classic style. Sir Joshua Reynolds says, “No works of any modern have so much the air of antique painting as those of Poussin.” Many prefer his landscapes, or those pictures of his in which landscape predominates, to his compositions in which his attention has been bestowed chiefly on the figures. Upward of 200 prints have been engraved from his works. The national gallery has several of Poussin's pictures, two of which are particularly praised, “A Bacchanalian Dance,” and “A Bacchanalian Festival.”

POWAN, *Coregonus* (q. v.) *cepedei*, a fish found in loch Lomond, Scotland, and often called *fresh-water herring*. It is not found in any other British lake or river, and has not yet been identified with any fish of the continent of Europe, although probably it is to be found in some of the Scandinavian lakes. It resembles the pollan (q. v.) of the Irish lakes, but is readily distinguished. The powan sometimes attains the length of 16

inches. Great shoals are seen in loch Lomond, rippling the surface of the water, and approaching the shores in the mornings and evenings. They are never seen in the middle of the day. The powan is highly esteemed for the table, and is in best condition in August and September. It is generally caught by nets.

POWDERED, or SEMÉE, in heraldry, strewn with an indefinite number of small charges.

POWELL, a co. in e. central Kentucky; drained by the Red river and many creeks; about 200 sq. m.; pop. '80, 3,639—3,631 of American birth; 288 colored. The surface is hilly and uneven; corn, grass, and pork are the staples. Co. seat, Stanton.

POWELL, The Rev. BADEN, an eminent English savant, son of a London merchant, was born at Stamford hill, near London, Aug. 22, 1796, and studied at Oriel college, Oxford, where he graduated M.A., with first-class mathematical honors, in 1817. Powell took holy orders in 1820, and was appointed vicar at Plumstead, in Kent, in 1821. In 1824 he was elected a fellow of the royal society; and three years later, was appointed Savilian professor of geometry, a chair which he held till his death, which took place in London, June 11, 1860. As a professor, his great aim was to bring about a larger recognition of the importance of physical and mathematical science in the curriculum of learned study at Oxford, and his efforts have not been altogether in vain. To the *Philosophical Transactions*, the *Reports* of the British association and other vehicles of scientific instruction, he contributed numerous valuable papers; but is perhaps best known by his strenuous exertions to obtain for modern science the right of modifying the views of nature and the origin of the world, expounded or thought to be expounded in the Jewish Scriptures. In this perilous department of controversy Powell displayed great learning, logical power, moderation of tone, and philosophic urbanity; but his conclusions were too unmistakably rationalistic to be palatable to the orthodox. Among his works may be mentioned *A Short Elementary Treatise on Experimental and Mathematical Optics, Designed for the Use of Students* (Oxford, 1833); *Revelation and Science* (Oxford, 1833); *A Historical View of the Progress of the Physical and Mathematical Sciences* (Lond. 1834); *The Connection of Natural and Divine Truth* (Lond. 1838); *Tradition Unveiled; A Candid Inquiry into the Tendency of the Doctrines advocated in the Oxford Tracts; A General and Elementary View of the Undulatory Theory as applied to the Dispersion of Light*, etc. (Lond. 1841); *Essays on the Spirit of the Inductive Philosophy*, etc. (Lond. 1855); *Christianity without Judaism* (1857); *The Order of Nature considered with Reference to the Claims of Revelation* (1859); and *On the Study and Evidences of Christianity in Essays and Reviews* (1860).

POWELL, CHARLES STUART, 1749—1811; b. England; played with the Covent Garden company, London, and was manager of the Haymarket theater. His first appearance in the United States was at Boston in 1792, and he managed the Boston theater, 1794—96. He afterward managed a theater in Halifax, where he died.

POWELL, JOHN HARE, 1786—1856; b. Philadelphia; educated at Philadelphia college; went into business and acquired wealth. He was secretary of the American legation in London 1807—11, and inspector-gen. in the Pennsylvania militia 1814—15. He now devoted himself to agriculture; did much to improve the breeds of cattle in the United States, and founded the Pennsylvania agricultural society in 1823. He published *Hints for American Farmers*, and *Memoirs of the Pennsylvania Agricultural Society*.

POWELL, JOHN WESLEY, b. New York, 1834. His family removed to Wisconsin in 1842, where, after receiving a common-school education, he became a teacher; entered Oberlin college, Ohio, which at the end of two years he left to study natural history. He traveled four summers in the western states collecting specimens. In 1860 he entered the army as a volunteer, and at the battle of Shiloh lost his right arm. Subsequently he became maj. of artillery and was engaged at Vicksburg and Atlanta. In 1865 he became professor of geology in the Wesleyan university at Bloomington, Ill. In 1867—68, having been authorized by congress to make a scientific exploration of Colorado territory, he surveyed with a party the valley of the Colorado river through its entire length, enduring great hardships. Important discoveries by this extraordinary expedition have been made in geology, archaeology, and ethnology.

POWER, in point of law, means an authority given to some person who would otherwise not be entitled to do the specific thing empowered. Thus an authority given to an agent to act for another is called a power of attorney; and there are numerous examples of powers contained in marriage settlements, wills, and miscellaneous deeds, which authorize one of the parties to do something in certain contingencies. Thus a power of revocation is often reserved to a party to revoke a will or deed. There is a power of appointment given to a married woman or widow to bequeath or divide certain property in certain events among her children. So a power to charge or jointure an estate, and to secure the portions of children. There are many nice and difficult rules of law applicable to matters connected with and arising out of powers. A power is created by a deed or will; and it is said to be executed when it is carried out. In Scotland powers are generally called faculties (q. v.).

POWER (*ante*), in law, may be considered under two heads—powers of attorney and powers created by will or deed, the latter class being connected with the law of real estate. 1. A power of attorney may be general, authorizing the agent to act for the grantor gen-

erally; or special, limiting his authority to particular acts. It is strictly construed, and may or may not be under seal, according to the statutes of the states. It was formerly held that the attorney could not execute a conveyance under seal unless his own authority was sealed, but this doctrine has been generally abandoned in this country. Powers of attorney are revocable or irrevocable; revocable in cases where they are not "coupled with an interest," and irrevocable only in that case. The power, if revocable, expires at the death of the grantor. 2. In the law of real property the term power was used to indicate an authority enabling a person to dispose of interest in real property through the statute of uses (see *ante*). The creation of such a power may be by will or deed, and the grant may contain a reservation to the grantor. Such powers may be *collateral*, where the donee has no estate in the realty; *general* or *special*, according to the liberty given the donee to appoint whom he pleases, or the confining of his choice to particular individuals or a class; may be of *appointment*, to create new estates, or of *revocation*, divesting or abridging an already existing estate; *appendant*, where a legal estate, as a life estate, is given the donee, and the powers granted by him must be limited by, and depend for their validity upon, his own estate, as leases under the life estate; or *in gross*, where the donee has authority to create only estates which do not depend on or take effect from his own estate or interest. The right of the donee to create an estate by the power is not itself an estate. The execution of the power must be by the donee, and cannot be assigned unless coupled with an interest or expressly authorized by the grant. If the donee alone be interested in the performance he may execute or not as he pleases, but equity will compel execution where the power is coupled with a trust for others. Where the execution in the exact terms of the power is impossible, courts may apply the *cy près* doctrine and carry out the donor's intention as closely as possible. The doctrine of powers is of less importance in the United States than in England, and is there chiefly used in perpetuating great family estates. By its means the head of a family may, in some measure, provide for contingencies impossible to foresee.

POWER, of a quantity, in mathematics, the result derived from multiplying it a certain number of times by itself. Thus the 2d power of 3 is $3 \times 3 = 9$, the 3d power is $3 \times 3 \times 3 = 27$, etc. The number of times the quantity is to be multiplied by itself, or the degree of the power, is denoted by the exponent, written at the right of the quantity; thus 3^2 denotes the 2d power of 3, and 3 is called the root of 3^2 .

POWER, TYRONE, 1795-1841; b. Ireland; taken to Wales while a child, and there made his first appearance on the stage as *Romeo*. In 1818 he retired, but in 1821 resumed his profession, and in 1824 made his first great success in London in the part of *Paddy O'Halloran*. He introduced the portrayal of Irish character in modern comedy, and was very successful in his visits to this country, 1833 and 1841. He was lost at sea on the return voyage of the last trip. He wrote *Impressions of America*, 1835, and two novels of no great merit.

POWERS, HIRAM, American sculptor, son of a farmer, and the eighth of nine children, was b. at Woodstock, Vt., July 29, 1805, and acquired the rudiments of education at a free district-school. While still a boy he went to Cincinnati, Ohio, where he became an apprentice to a clock-maker, and about the same time formed the acquaintance of a German sculptor, who taught him to model in plaster. Subsequently, he was employed for several years making wax-figures and fitting them with machinery, for the Cincinnati museum, where his "Infernal Regions" horrified thousands of visitors. In 1835 he went to Washington, where he executed the busts of several distinguished persons; and, with the aid of Mr. Nicholas Longworth, in 1837 went to Italy to study his art, residing in Florence till his death. In 1838 he produced his statue of "Eve," which excited the admiration of Thorwaldsen; and in 1839 the still more popular "Greek Slave," of which six copies in marble, with cast copies innumerable, were produced. Of his "Fisher Boy," three copies were ordered. Among his other works the chief were "Proserpine," "Il Penseroso," "California," "America" (the last for the Crystal Palace, Sydenham); statues of Washington for the state of Louisiana, of Calhoun for South Carolina, and Webster for Boston; and busts of Adams, Jackson, Marshall, Van Buren, and other distinguished Americans. He died June 27, 1873.

POWERS, MECHANICAL. See **MECHANICAL POWERS**, *ante*.

POWESHIEK, a co. in s.e. Iowa, drained by English and North Skunk rivers and Bear creek, traversed by the Central Iowa, and the Chicago, Rock Island and Pacific railroads; about 575 sq. m.; pop. '80, 18,936—17,015 of American birth. The surface is rolling, and contains coal. The soil is fertile. The principal productions are corn, oats, wheat, wool, and hay. Co. seat, Montezuma.

POWHATAN, a co. in s. central Virginia, bounded by the James river on the n. and the Appomattox on the s.; 280 sq. m.; pop. '80, 7,817—7,773 of American birth; 5,091 colored. The surface is level and heavily wooded: the corn, tobacco, and pork are the staples. The Richmond and Danville railroad touches the county. Co. seat, Scottsville.

POWHATAN, 1550-1618; an American Indian sachem. His name was Wahunsonacock, the name Powhatan being that of his residence, and given to him erroneously by the English. His residence consisted of 12 wigwams near the site of Richmond. He raised himself from the rank of a chieftain to the command of more than 20 tribes, num-

bering about 8,000 people. His territory extended from the most southern tributaries of the James river, on the s. to the Patuxent on the north. When first known to the English he was about 60 years of age, of a grave aspect, tall, and well-proportioned, and very vigorous. Most of the tribes over whom he ruled he had conquered. He usually kept a guard of 40 or 50 warriors around him, especially when he slept, but increased the number to 200 after the English came. At first he practiced much deception toward the English, and his plans for their destruction showed great cunning; but being baffled by the superior sagacity of capt. Smith, he concluded to live at peace with the newcomers, and received Smith and Newport hospitably. When afterward Smith was taken prisoner, and about to be killed, he spared his life through the entreaties of his young daughter Pocahontas, and sent him to Jamestown with professions of great regard. Newport, returning from England, brought presents, one of which was a crown, and after a few days the ceremony of coronation was performed. Powhatan for this honor gave him his mantle and old shoes. Pocahontas having by a stratagem been made a prisoner by the English and taken to Jamestown, a message was sent to Powhatan that he must ransom her with certain men and articles, which he was accused of having taken. He made no answer for three months. Meanwhile an English youth Rolfe wooed her, and obtained her consent to marriage. The connection proved a bond of union between Powhatan and the English. The grandson of Powhatan, Thomas Rolfe, was educated in London, came to America, became a gentleman of distinction, and possessed an ample fortune. He was the ancestor of the distinguished John Randolph, and of others bearing that name in Virginia.

POWNALL, THOMAS, 1722-1805; b. Lincoln, Eng.; took a degree at Cambridge, 1743; occupied several political positions, and in 1753 was sent out as secretary to the province of New Jersey, of which he became lieut. gov. in 1755. He was gov. of Massachusetts from 1757 to 1760, and of South Carolina in 1761. On his return to England he became a member of parliament, and opposed the overbearing course of the crown toward the American colonies. He was somewhat distinguished as an archæologist. Among his publications were, *A Topographical Description of the Middle British Colonies*, 1775, and *The Administration of the Colonies*, 1766.

POYDRAS, JULIEN; d. 1824; b. Louisiana; founder of an orphan asylum for girls, to which he gave \$100,000; and of a college at Point Coupée, which he endowed with \$20,000. He was delegate from the territory of Orleans, now the state of Louisiana, in 1809-12.

POYN'TELL, pavement or tiles laid in small lozenge form.

POZZO DI BORGO, CARLO ANDREA, a celebrated Russian diplomatist, was b. at Alala in Corsica, March 8, 1768, and was educated at the university of Pisa. Returning to Corsica, he adopted the profession of advocate, in which he soon became distinguished for his acuteness, ingenuity, and brilliant eloquence; and about this time an intimacy sprang up between him and the two young Bonapartes, Napoleon (I.) and Joseph. Pozzo's great ability soon gained for him the esteem of Paoli (q. v.), who made him the confidant of his plans, to the intense disgust of the Bonaparte family, who considered themselves slighted. A coolness in consequence sprang up between Pozzo and young Napoleon, which, as their paths in life diverged more and more, passed through the various grades of antagonism, dislike, distrust, and hatred, till, when the latter swayed the scepter of France, and the former became the supreme trusted adviser of Russia and Austria, it culminated in a deadly struggle for victory between the diplomatist and the warrior, to be ended only by the death of one or the destruction of his power. Pozzo represented Corsica in the French national assembly (1791-92); but his party, that which wished to unite liberty and hereditary rule, being overpowered by their "radical" opponents, he was compelled to return to Corsica, where he again attached himself to Paoli's party; and on the failure of that chief's plans, retired to London. Here he became the agent of the French refugees; and in 1798, having now thoroughly broken with the Bonapartes, he went to Vienna to promote an alliance of Austria and Russia against France, and accompanied the Russian army in the subsequent campaign of 1799. In 1803 he entered the Russian service as a counselor of state, from this time devoting his whole attention to diplomacy. He was at the bottom of the Russo-Austrian alliance, which was dissolved by the battle of Austerlitz (1805); but after the treaty of Tilsit, fearing lest Napoleon might insist upon his surrender, he retired to Austria, from which country Napoleon, in 1809, demanded his extradition. The emperor Francis refused; but Pozzo, to save trouble, retired to England (1810), where he stayed for some time, and then returned to Russia. He soon after induced the emperor Alexander to make certain custom-house regulations which offended Napoleon, and were a chief cause of the rupture which resulted in the campaign of 1812; he also suggested to the emperor, and effected the seduction of Murat, Bernadotte, and Moreau from the Napoleonic cause; and after the victorious allies had driven Napoleon across the Rhine, Pozzo, at the congress of Frankfort-on-the-Main, drew up his famous declaration, "that the allies made war not on France, but on Napoleon." From this time his whole energies were devoted to the task of keeping Alexander inflexible with regard to Napoleon's seductive offers of accommodation; but after his old antagonist's downfall, he exerted himself with equal vigor at Paris (where he signed the treaty of 1815 as Russian ambassador) and Aix-la-Chapelle

(1818) to ameliorate, as much as possible, the hard conditions imposed upon France. After the accession of the emperor Nicholas, he was, though highly esteemed, less confided in, and accordingly accepted the post of Russian ambassador in London; but retired from public life in 1839, and settled in Paris, where he died Feb. 15, 1842.

POZZOLANA, or **PUZZOLANA** a mineral substance, produced by volcanoes, and abundant in volcanic countries, is named from Pozzuoli, near Naples. It is earthy in character, consisting of particles in a very loose state of aggregation, but its chemical composition agrees with that of basalt (q.v.). It is found of various colors—brown, yellow, reddish, and gray. Brown and yellow are the ordinary colors of the pozzolana of Italy. See **CEMENTS**.

POZZUOLI, a city of southern Italy, at the e. of the bay of Naples, in the province of Naples, with 11,752 inhabitants; has manufactures of soap. But the interest which attaches to it is drawn from its numerous memorials of classic ages. Its cathedral was the temple of Augustus. There is the temple of Serapis, an Egyptian god, who was invoked by the priests to render the mineral waters of the place efficacious as remedies. The interior of the temple had a portico of 24 pillars, surrounded by 70 chambers for the sick and for the priests. In the harbor there may still be seen 13 pillars, which formerly supported as many arcades, under which the inhabitants used to congregate to watch for the vessels coming from Africa. There is an arch erected to Antoninus Pius, for having restored 20 of those pillars. There are the remains of an amphitheater which might have contained 25,000 spectators. The *Solfatara (Forum Vulcani)* is a half-extinct volcano near Pozzuoli, from which springs saline water, used as a remedy for cutaneous diseases. Near the Montenuovo there is the famous lago d'Averno, inclosed among hills; and at a short distance from it there is the Sibyl's cave (*La grotto della Sibilla*), which, however, is nothing more than the remains of a subterranean passage leading, perhaps, to Baja. On a plain there is an extinct volcano; there Cumæ once stood, now all in ruins. In the environs of Pozzuoli are to be seen the promontory of Posilipo, the Elysian fields (*Campi Elisi*) near the harbor of Miseno, and the lake of Agnano, formerly the crater of a volcano.

Pozzuoli was probably built by the Cumani (Greek colonists of Cumæ), who gave to its gulf the name of *Cumanus*. They called the new port *De Cœarchia*, a name which was afterward changed to *Puteoli*, in allusion perhaps to the sulphur wells or springs (*putei*) with which it abounded. Puteoli is first mentioned in history during the second Punic war, when, by order of the senate, it was surrounded by strong walls. In 214 B.C. it repulsed Hannibal, and from this period rose in importance until, toward the close of the republic, it became virtually the port of Rome, and during the empire was really the first emporium of commerce in Italy. Puteoli was destroyed by Alaric, Genseric, and Totila, and though rebuilt by the Byzantine Greeks, it was exposed to new devastations, to earthquakes, and volcanic eruptions, and soon sank into the decay which continues to mark it.

PRACTICE, in arithmetic, is the name given to a method, or rather a system of expedients, for shortening or avoiding the operation of compound multiplication. The nature of the expedients will be best understood by an example: Suppose that the price of 64,875 articles at £2, 17s. 6d. is required. It is obvious that the price, at £1, would be, £64,875; therefore, at £2, it is £129,750; at 10s., it is the half of that at £1, viz., £32,437, 10s.; at 5s., the half of this last sum, or £16,218, 15s.; and at 2s. 6d., the half of this, or £8,109, 7s. 6d. The sum of these partial prices gives the whole price—thus:

	£	s.	d.		£	s.	d.
Price at 2	0	0			129,750	0	0
“ “ 0	10	0	(=½ of £1),		32,437	10	0
“ “ 0	5	0	(=¼ of 10s.),		16,218	15	0
“ “ 0	2	6	(=½ of 5s.),		8,109	7	6
“ “ 2	17	6			186,515	12	6

The general principle of the method is to decompose the lower denominations of the compound factor into *aliquot parts* of the higher unit. A still simpler way with the above example is the following:

	£	s.	d.		£	s.	d.
Price at 3	0	0			191,625	0	0
“ “ 0	2	6	(=⅓ of £1),		8,109	7	6
“ “ 2	17	6			186,515	12	6

PRADIER, JEAN JACQUES, 1792–1852; b. Switzerland; studied sculpture in the studio of Lemot at Paris. In 1813 his group of “Philoctetes at Lemnos” won the great prize, and the privilege of residing as an academy student in Rome, where he remained five years. There he studied the antique, but the works of Canova seem to have had a greater influence over him. Upon his return to Paris, in 1819, he entered upon a career of great popularity. Among his more famous works are “Bacchante and Centaur,” 1819; “Psyche,” 1824; “Venus and Love,” 1836; “Phryne,” 1845; “Pandora,” Bacchantes, Amazons, etc. He also produced many religious pieces, such as a

colossal "Christ on the Cross," a "Marriage of the Virgin," for the Madaleine, a "Virgin" for the Avignon cathedral, etc.

PRADT, DOMINIQUE DUFOUR, Abbé de, 1759-1837; b. France; represented the clergy of Normandy in the states-general. He acted with the royalists in the constituent assembly, was in exile at Hamburg, 1791-1801, and was created baron, bishop of Poitiers, and grand almoner to the emperor Napoleon in 1804. For his efforts in securing the abdication of Charles IV. of Spain he was made archbishop of Mechlin, and in 1812 minister at Warsaw; but he soon fell into disgrace with the emperor, who sent him back to his diocese. When the allies invaded France, he joined the Bourbons, but failed to secure their favor, and had to give up his archbishopric, in which he had never been confirmed by the pope.

PRAED, WINTHROP MACKWORTH, 1802-1839; b. London; educated at Eton and Trinity college, Cambridge, graduating at the latter in 1825, distinguishing himself by his classical attainments, and receiving numerous prizes; admitted to the bar in 1829; in 1830 and 1831 was a member of parliament; in 1834 secretary of the board of war; subsequently recorder of Barnstable and deputy high-steward for the university of Cambridge; opposed the reform bill. A complete edition of his poetical works, prepared by his sister, lady Young, with a memoir by the rev. Derwent Coleridge, was published in 2 vols. His *Poems* were edited by R. W. Griswold in New York.

PRÆMUNIRE, the name given, in English law, to a species of offense of the nature of a contempt against the sovereign and his government, and punishable with forfeiture and imprisonment. The name is derived from the first words (*præmunire* or *præmonere futias*) of a writ originally introduced for the purpose of repressing papal encroachments on the power of the crown. The first statute of præmunire was passed in the reign of Edward I. The attacks of the popes on the rights of private patrons, by bestowing bishoprics, abbeys, etc., on favorites before they were void, were the immediate cause of various subsequent statutes of præmunire, which made it penal to endeavor to enforce the authority of papal bulls and provisions in England. By later statutes, a number of offenses of a miscellaneous description have been rendered liable to the penalties of a præmunire, as (by 6 Anne, c. 7) the asserting by preaching, teaching, or advisedly speaking, that any person, other than according to the acts of settlement and union, has any right to the throne of these kingdoms, or that the sovereign and parliament cannot make laws to limit the descent of the crown. The knowingly and willfully solemnizing, assisting, or being present at any marriage forbidden by the royal marriage act, is declared by 12 Geo. III. c. 11 to infer a præmunire.

PRÆNESTE. See PALESTRINA.

PRAGA. See WARSAW.

PRAGMATIC SANCTION, or RESCRIPT, a solemn ordinance or decree of the head of a legislature relating either to church or state affairs. The term originated in the Byzantine empire, and signified a public and solemn decree by a prince, as distinguished from the simple rescript, which was a declaration of law in answer to a question propounded by an individual. This name is given to several important treaties, of which the principal are: 1. An ordinance of Charles VII. of France, in which the rights of the Gallican church were asserted in opposition to the usurpation of the pope in the appointment of bishops. Twenty years later, Louis XI., in order to please pope Pius II., was induced to give up this pragmatic sanction, which was ignominiously dragged through the streets of Rome; but at a subsequent date, a quarrel having arisen between Louis and the pope, the pragmatic sanction was re-enacted. 2. The instrument which settled the empire of Germany in the house of Austria (1439 A.D.). 3. The ordinance by which Charles VI., emperor of Germany, having no male issue, settled his dominions on his daughter, the archduchess Maria Theresa, which was confirmed by the diet of the empire, and guaranteed by Great Britain, France, the States General, and most of the European powers. 4. The settlement of the succession of the kingdom of Naples, which was ceded by Charles II. of Spain, in 1759, to his third son and his descendants.

PRAGUE (Ger. *Prag*, Slav. *Praha*), capital of the kingdom of Bohemia, is situated in 50° 5' n. lat., and 14° 30' e. long., on the slope of the hills which skirt both sides of the river Moldau, 251 m. n.e. of Vienna by railway. Pop. '69, 157,275. Prague, which ranks as the third city of Austria, presents a highly picturesque appearance from the beauty of its site, and the numerous lofty towers (upward of 70 in number) which rise above the many noble palaces, public buildings, and bridges of the city. It consists of four principal parts: 1. The Kleinseite, chiefly occupied by the public offices, and the residences of the officials; 2. The Hradsehn (or palace district), surmounted by the vast imperial castle, and containing some of the most ancient and interesting churches and palaces of Prague; 3. The Jews' quarter, now known as the Josephstadt, which forms the chief business-quarter, and contains numerous churches, ecclesiastical and educational establishments; 4. The "New Town," containing the largest number of streets and open squares, with many modern palaces, charitable institutions, and places of public resort. Prague is surrounded by walls and bastions, and has eight gates. The citadel, the ancient residence of the old dukes of Bohemia, is well fortified, and from its elevated position above the Moldau, thoroughly commands the city. Prague has 55

Catholic; and 3 Protestant churches, 15 monasteries, and 10 synagogues. Among the most noteworthy of these are the metropolitan, or St. Veits, with its lofty tower, a fine but unfinished specimen of the Gothic of the 14th c., containing the remains of St. Ludmila, first duchess of Bohemia, and of seven kings and emperors of Germany, with the grave of St. Wenzlaus, and the silver sarcophagus of St. Nepomuk (see St. JOHN or NEPOMUK), a popular saint of Bohemia; St. Nicolas, or the church of the Jesuits, with its many towers and costly decorations; the Thein church, built in 1407; the old Hussite church, with the grave of Tycho Brahe, and its marble monuments of the Slavonic martyrs, Cyril and Methodius. Among the numerous public and other buildings of note in Prague, the following are some of the more interesting: the royal palace, the cathedral, the Theresa institution for ladies, the ancient Byzantine church of St. George, the Hradschin square, with the imposing palaces of the primate, the ex-emperor, and prince Schwarzenberg; the Loretto chapel, with its gorgeously bejeweled church vessels; the vast Czerni palace, now used as an institution of charity; the picture gallery; the Premonstratensian monastery of Strahow; the royal library; and at the summit of the Laurenzberg, the restored church of St. Lawrence. Prague has, however, numerous public gardens and walks in the suburbs, which, with the several royal and noble parks open to the public in the vicinity of the city, afford varied resources for health and open-air recreations. The suburb of Karolinenthal, which is traversed by the great viaduct of the railway, and is of modern growth, has some fine buildings, numerous gardens, barracks, and manufacturing establishments; and somewhat further n. is the great botanical garden, with the neighboring public walks on the Moldau. The university, which is the most ancient in Germany, having been founded in 1348, enjoyed the greatest celebrity in the 15th c., when many thousand scholars came from foreign countries to study in its halls. It is now in a state of activity, after a long period of decay, and has good medical and surgical schools; a library containing 142 000 volumes, and 7,762 manuscripts, of which some are very rare; a fine observatory; museums of zoology and anatomy; a botanical garden, etc. Prague has also 1 polytechnic, 3 gymnasia, Bohemian and German training-schools, and about 20 parish schools. The manufactures include leather, cotton, and linen goods, stockings, printed cottons, machinery of various kinds, beet-root sugar, etc. Prague is the great center of the commerce of Bohemia, and the seat of an important transit trade.

History.—According to popular tradition, Prague was founded in 722 by the duchess Libussa. In the 13th c., its importance was fully recognized; in the 14th and 15th c., its munificently endowed university brought foreigners to it from every part, until the decision of the emperor Wenzlaus to favor Bohemian students more than others drove thousands of the scholars with their professors to other spots, and led to the foundation of universities at Leipzig, Ingolstadt, Rostock, and Cracow. In 1424 Prague was conquered, and almost destroyed by the Hussites, who had made a successful stand against the emperor Sigismund's army; but after the subsequent defeat and submission of the insurgents, the city was rebuilt. In the thirty years' war, it suffered severely, and in 1620 the battle was fought at the White mountain, near the city, in which the elector-palatine, Frederick V., known as the winter king, and son-in-law of James I. of England, was completely defeated, and compelled to renounce his assumed crown, and to give up the town into the power of the emperor. Swedes and imperialists successively gained possession of it during the war; and a century later, during the seven years' war, it again fell into the hands of different victors, having been compelled, in 1744, to capitulate to Frederick the great of Prussia; and until the war of deliverance in Germany, and the downfall of Napoleon, the city continued to suffer more or less directly from the troubles in which the house of Austria had been involved. During the last 60 years, it has, however, made rapid strides, and enjoyed prosperity and quiet, except in 1848, when the meeting of the Slavonic congress within its walls called forth such strongly marked democratic demonstrations on the part of the supporters of Pan Slavism (q. v.), that the Austrian government dissolved the conclave, and restored quiet by the summary method of causing the old and new town to be bombarded for two days.

PRAIA GRANDE. See RIO DE JANEIRO, PROVINCE.

PRAIRIE (Fr. meadow) was the name given, by the early French explorers of the northern portion of the Mississippi valley, North America, to the vast fertile plains which extend from western Ohio and southern Michigan, across the states of Indiana, Illinois, Missouri, Arkansas, Iowa, Kansas, Nebraska, and Dakota territory, including the southern portions of Wisconsin and Minnesota. These great plains or savannas are sometimes flat, but oftener rolling like the long swells of the ocean, and rise in gradual elevation from 800 to 1500 ft. above the level of the sea. They are drained by numerous rivers, branches of the Ohio, Mississippi, and Missouri, or emptying into lake Michigan, whose channels seem to have been worn to the depth of 50 to 300 ft., with vertical walls or bluffs of limestone, sandstone, displaying in some places banks of clay, sand, and loam, 200 ft. in thickness. Beneath the prairies n.w. of the Ohio are extensive coal-fields, with deposits of iron, lead, etc. The soil is finely comminuted, rich, and extremely fertile, varying in thickness from 1 or 2 ft., to the bottomlands on the borders of the rivers, which are of great depth and inexhaustible fertility. These plains are destitute of trees, except in isolated groves, a few rocky ridges, and the

borders of streams. They are covered with fine grasses, and brilliant flowers of various species of the helianthoid *compositæ*. Water is found from 15 to 30 ft. below the surface. These great prairies, covering an area of about 400,000 sq. m., formerly fed vast herds of buffalo, deer, wild turkeys, prairie-hens or grouse, prairie-dog, squirrel, etc. In the autumn, the dried grasses, fired by the Indians, converted them into seas of flame. The lack of timber is attributed by some to the fineness of the soil. Remains of ancient mounds, fortifications, and cities show that they were, at some distant period, inhabited by a more civilized race than the Indians found by European discoverers. These great rolling plains, or natural pastures, with only the labor of plowing, produce large crops of wheat and maize, and, penetrated by navigable rivers, and crossed by cheaply built railways, they form one of the most easily cultivated and prolific regions of the world, and are capable of sustaining immense populations.

PRAIRIE (*ante*), the French word to signify meadows, and qualified by them in use by distinguishing natural prairie from artificial prairie or meadow. From the vastness of the American prairie, so named by the early French discoverers, it has been erroneously inferred that the name implied great extent of natural meadow. Small prairies are found in the primeval state in nearly every part of the world, and oases of prairie are not infrequent in the midst of the forest lands of the middle states. Prairies of vast extent are also found far above the altitude of 1500 ft. as given in the above article. The great plateaus of Wyoming, Montana, Colorado, and New Mexico, are prairies of a less fertile character, fresher from nature's great processes of erosion, and having too little rainfall to make a rank vegetation. They lie from 2,000 to 7,000 ft. above the sea. Narrow valleys near the sources of the great tributaries of the Mississippi furnish excellent summer pasturage to the height of 10,000 feet. On the line of the Union Pacific railway, mowing machines are used to cut the natural hay in some of these valleys 6,000 ft. above the sea. The prairie called Laramie plains is between 6,000 and 7,000 ft. above the sea. Marsh meadows by the sea side are equally prairies in the original meaning of the word. The origin of the very fertile prairies in the valley of the Mississippi river proper, now mostly under culture, has been the subject of many theories. How soil so rich, upon which most of the trees of the neighboring forests flourish luxuriantly when protected, should have failed to be covered with them in a state of nature is the question. It is answered by vegetable physiologists thus: The excrements of vegetable growths from the roots of trees and plants, and even the annual accumulation of their own leaves after a continuous growth of the same species, become poisonous to the genera which emit them, though perfectly nutritious to plants of different families. It is claimed that the long continuance of forest growth on a rich soil, made constantly richer by its own annual deposits of leaves, dead wood, and excretions from the roots, finally makes it unfit for their growth. Sickness and decay produce more and more dead wood, so that fires finally destroy utterly what the soil refuses to nourish. Rank weeds and grasses follow, which in their turn, ripe and dry in autumn, make food for new flames that destroy the remnant of tree vegetation, even the young brood of new species which might otherwise hold their ground. Tree-roots cannot long live when their tops are destroyed. Perennials on the other hand have an extraordinary power to preserve life in their roots, under the action of prairie fires. Once in full possession of the soil, it is easy to see that annual autumn fires where there are not animals enough to feed down the summer growth, will not only preserve the ground won from the forest by grasses, but will singe the surrounding forests, and wherever they are sickly from the cause first named, will finally consume them. Ages of continuous growth of grasses and other perennials, and of countless annuals, have assimilated those qualities in the soil that became noxious to trees; and in nature's rotation of crops the soil has again become fitted for their growth. It is only necessary to check the annual prairie fires for a new crop of forests to dominate the grasses. Trees were beginning to resume possession of the prairies when settlements began. The increase of the buffalo decreased the food for autumn fires by so much as they pastured upon the grasses. The moisture of the ground contiguous to streams and the sweetness of the late summer grasses in these places would naturally make spots where trees could have time to get rooted in the absence of fires. Profs. Hall, and Whitney ascribe the treeless condition of the prairies to the finely comminuted condition of soils formed out of a sedimentary rock strata, but this theory is entirely unsatisfactory and inconclusive. Dr. Lesquereux, in his geological report for Illinois, supposes that the prairies have all been lake beds, first occupied by aquatic plants, succeeded as they became drier by grasses, the burning of which prevented the rooting of trees. Prof. Winchell claims that the vegetation of the prairies was pre-glacial, that on the subsidence of the glacial drift the seed took and held possession of the soil, etc. Prof. J. S. Newberry suggests a theory of climatic influences as to rainfall, etc., but presents no facts to explain why n.w. Ohio was a dense forest, and in the same latitude, with the same climate, and rainfall, n. Illinois was nearly all prairie. Unquestionably forests require more rainfall and are more likely to be killed out by a repetition of severe droughts than the grasses, but no such differences occur to show cause for the diverse conditions just cited.

Prairies of great extent are found in the southern part of South America, e. of the Andes, similar in character to those of the western states; less fertile than those of the

valley of the upper Mississippi, and less subject to extremes of cold than the the table-land prairies of the United States.

PRAIRIE, a co. in e. central Arkansas, drained by the White river, which bounds it on the n., and is navigable, and by Des Arc and Watansaw bayous; traversed by the Memphis and Little Rock railroad; 800 sq. miles. The surface is level and heavily timbered; rice, cotton, and corn are the staples. Co. seat, Stanton.

PRAIRIE DOG, *Arctomys Ludovicianus*, a very interesting species of marmot (q.v.), an inhabitant of some of the western prairies (q.v.) of North America. It is about the size of a squirrel or large rat; and has soft, reddish-gray fur, each hair being red with a white tip. The name prairie dog seems to have been given to it from its frequent utterance of a sound somewhat like the bark of a very young puppy. For the same reason, it is also called the barking squirrel. A more correct name would be barking marmot, or prairie marmot. The prairie dog does not inhabit the rich grass-covered prairies where the buffalo (bison) abounds; but those which, for want of water, exhibit a comparatively scanty vegetation; and in these it is to be found in vast numbers, being gregarious in its habits, burrowing in the ground, and throwing up mounds of earth, on the summit of which the little creature often sits as if on watch. The whole extent of a great level prairie is often covered with these hillocks. "Their number is incredible," says the honorable C. A. Murray, in his *Travels in North America*, "and their cities, for they deserve no less the name, full of activity and bustle." As soon as the hand is raised to a weapon or missile, they pop into their holes, with amazing rapidity, and then wheel round and look out at the enemy. Still more interesting is the frequent association of the prairie dog with the burrowing owl and the rattlesnake in the same burrow; an association which has been variously described as one of strange friendship among very different creatures, in a state of nature; and as of the most opposite character, the owl and the rattlesnake being supposed to prey upon the prairie dog and its young. But in so far as the owl is concerned, this is rendered very doubtful by the fact, that its *casts* seem to show its food to consist entirely of insects. It probably finds the burrows of the marmots its only convenient retreat, and their proper inmates harmless neighbors.

PRAIRIE-DU-CHIEN, a t. of the state of Wisconsin, on the right bank of the Mississippi, 3 m. above the mouth of the Wisconsin, and 165 m. w. from Milwaukee. It is a prosperous and rapidly increasing town, and in its neighborhood are rich copper-mines. Pop. '70, 2,700.

PRAIRIE HEN. See GROUSE.

PRAIRIE SQUIRREL, the popular name of the North American rodents of the marmot family belonging to the genus *spermophilus* (Cuv.). They have a thick-set body, but slenderer than that of the marmot, a long tail, smallish ears, good-sized cheek-pouches, a small claw or flat nail on the thumb, and short legs and toes. When the winters are cold they pass them in a torpid condition, stopping up the mouths of their holes. The California prairie squirrel (*S. beecheyi*, F. Cuv.) is about 11 in. long, of a mottled yellowish-brown color, with a flat hairy tail about 8 in. long, with a slender body, acute ears and head, and coarse, thin fur. This species does much damage to vegetables and grain. Better known is the striped prairie squirrel, common in North America n. of 40°, and called in the n.w. states the gopher. This species lives in shallow burrows on the prairies, and feeds on insects, field-mice, grasses, roots, etc. It is rarely found in well-cultivated fields. It is about 6 in. long, with a brownish-yellow tail, tipped with black, and about 4 m. long. Its color above is dark brown, with yellowish-gray stripes; the lower parts and the tail are brownish-yellow. Its proper name is *spermophilus tredecim-lineatus* (Aud. and Bach.).

PRAIRIE WOLF. See WOLF, *ante*.

PRAJĀPATI (from *prajā*, creation, created beings; and *pati*, lord) is, in Hindu mythology, a name of the god Brahmā, but also a name of those divine personages who, produced by Brahmā, created all existing beings, inclusive of gods, demons, and natural phenomena. Manu knows of ten such *Prajāpatīs* engendered, though pure meditation, by the god Brahmā—viz., Marichi, Atri, Angiras, Pulastya, Pulaha, Kratu, Prachetas or Daksha, Vasishtha, Bhrigu, and Nārada. The Mahābhārata, however, leaves out Daksha, Bhrigu, and Nārada; and other varieties occur in the different Purānas. Whereas, also, these "lords of creation," in conformity with Manu, are in some of these works looked upon as the mind-born sons of Brahmā, some Purānas derive them from different parts of Brahmā's body. The only interesting point in this theory of the *Prajāpatīs* is the assumption that the world did not immediately proceed from Brahmā, the highest god, but through the intermediate agency of beings which thus stand between him and creation.

PRAJNĀ PĀRAMITĀ (literally, the wisdom which has gone to the other shore, viz., of its object; i.e., absolute or transcendental wisdom, from the Sanskrit *prajñā*, wisdom, *pāram*, to the other shore, and *itā*, gone) is the title of the principal Sūtra (q.v.) of the Mahāyāna school of the Buddhists (see BUDDHISM). Its main object is metaphysical; but the commencement of the work is merely a eulogy of Buddha, and of the Boḍhisattwas, who form his retinue. Other parts of it contain incidental narratives of wonderful phenomena connected with the apparition of Buddhist saints, or a description of the

benefits arising from an observance of the Buddhistic doctrine, or verses in which the Buddha is praised by his disciples, and similar irrelevant matter. It is probably on account of the extent which could easily be imparted to such episodic topics, but also by amplifying the real substance of the work, that several recensions of the Prajñā Pāramitā are in existence, both with the Buddhists and Tibetans (see LAMATISM); some of these do not contain more than 7,000 or 8,000 or 10,000 slokas, or paragraphs; but others amount to 18,000, 25,000, or 100,000 slokas. The following may serve as a specimen of the abstruse ideas treated of in this great work of the Buddhistic doctrine: No object has existence or non-existence; nothing belongs to eternity or non-eternity, to pain or pleasure, to vacuity or non-vacuity. All objects are without attributes and with attributes, with and without characteristic marks. Bodhisattwa (the name for a deified saint) and Prajñā (wisdom) are synonymous terms; such a term neither arises nor perishes; it exists neither inwardly nor outwardly, because it cannot be seized; but the Bodhisattwa must accomplish his career under this fallacious name; it is his duty, however, to look neither upon form nor anything else as an eternal or non-eternal, as a pure or impure matter, etc. Then only when he is in a condition of complete indifference regarding everything, is he capable of encompassing the whole wisdom. . . . The absence of nature is the nature of everything; all objects are separated from their characteristics. All objects neither appear nor are born, nor disappear, nor cease to be, nor are they pure nor impure, nor are they acquirable nor non-acquirable. Want of understanding is the not understanding that objects are nonentities. From the want of understanding proceed all subjective notions; and through the latter one becomes incapacitated from fulfilling the behests of the sacred doctrine, and from entering the path which leads to wisdom. . . . Everything is like the echo, or a shadow, or anything else without substance. In short, the doctrine of the Prajñā Pāramitā is the entire negation of the subject as well as the object; and whatever be the difference in detail between the points of view from which it looks upon subject or object, or between its comparisons and circumlocutions, the result is always the same: that the object of ascertainment, or the highest wisdom, has no more real existence than the subject striving to attain to it, or the Bodhisattwa.—See E. Burnouf, *Introduction à l'Histoire du Bouddhisme Indien* (Paris, 1844); W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St. Petersburg, 1860).

PRĀKRIT (from the Sanskrit *prakṛitī*, nature; hence, natural, not accomplished, vulgar) is the collective name of those languages or dialects which are immediately derived from, or stand in an immediate relation to Sanskrit, or "the accomplished language" (q. v.) of the Hindus. These languages, however, must not be confounded with those modern languages of India which also have an affinity with the Sanskrit language; for, in the Prākṛit languages, however much they may differ from Sanskrit in their phonetic laws, the words and grammatical forms are immediately derived from that language; whereas, in the modern tongues of India, there is not only no connection between their phonetic laws and those of Sanskrit, but their grammatical forms also are wholly different from those of the ancient language; and while many of their words have no Sanskrit origin, even those which have show that they are not immediately drawn from that source. The Prākṛit languages comprise, beside the *Pāli* (q. v.), which generally, however, is not included among them, those dialects which are found in the dramas and in the oldest inscriptions. In the dramas it is women, except female religious characters, and subordinate male personages, who are made to speak in these languages—the use of Sanskrit being reserved for the higher characters of the play—and among the former, again, the choice of the special Prākṛit dialect is adapted by the poet to the rank which such a subordinate personage holds, the more refined dialect being appropriated, for instance, to the wives of the king or hero of the play; an inferior Prākṛit to his ministers; others less in degree to the sons of the ministers, soldiers, town-people, and the like; down to the lowest Prākṛit, which is spoken only by servants, or the lowest classes. A work on the poetical art, the *Sihityadarpana*, enumerates 14 such Prākṛit dialects—viz., the *Saurasenī*, *Māhārāshtrī*, *Māgadhī*, *Arāhamāgadhī*, *Prācya*, *Avantīkā*, *Dākshīnātyā*, *Sikcarī*, *Bāhlikā*, *Drāvīdī*, *Abhīrī*, *Chāndālī*, *Sābarī*, and *Paisāchī*; but Vāruuchi, the oldest known grammarian of the Prākṛit dialects, knows but four—viz., the *Māhārāshtrī*, *Saurasenī*, *Māgadhī*, and *Paisāchī*; and Lassen, in the *Indische Alterthums-kunde*, holds that of those only the *Saurasenī* and the *Māgadhī* have a really local character—the former, as he assumes, having been the vernacular of a large district of western, and the latter, which is also the Prākṛit in the inscriptions of king Asoka—of eastern India; whereas the *Māhārāshtrī*, or the language of the Mahrattas, does not seem to have been the language of the country the name of which it bears; and the *Paisāchī*, or the language of the Pisācha, is obviously merely a fancy name. The principal Prākṛit dialect is the *Māhārāshtrī*; the lowest, according to some, the *Paisāchī*, of which two varieties are mentioned; but, according to others, the *Apabhramoa*—which word originally means "a falling-off"—i.e., a dialect which completely deviates from the grammatical laws of Sanskrit, but in this special application would designate a dialect even inferior to the *Paisāchī*, and is compared by a grammarian to the language of the reptiles. On the grammar of the Prākṛit languages, see Chr. Lassen, *Institutiones Linguae Pracritice* (Bonn, 1837). The Sūtras, or grammatical rules of Vāruuchi, have been edited in the same work; but more elaborately, with a commentary, copious notes, an

English translation, appendices, and an index, by Edward Byles Cowell, who has also added to this excellent edition *An Easy Introduction to Prākṛit Grammar* (Hertford, 1854).

PRAËE, a green variety of quartz (q.v.), sometimes found crystallized in the same forms as common quartz, but more generally massive, or in prismatic and granular concretions. It is rather a rare mineral. It is sometimes cut as an ornamental stone, but is not highly esteemed.

PRATI, GIOVANNI, b. at Dascindo, in the province of Trent, Italy, in 1815; took his degree at Padua. His first poem in 1841, *Edmenegarda*, was received with favor. His other popular poems are: *The Song of the Future; A Hymn to Italy; Rodolfo; Count Riga; Bullate; Memorie e Lacrime; Ariverto*, 2 vols. Complete editions of his writings were published at Florence and Milan. In 1862 he became a member of the Italian parliament.

PRATINCOLE, a genus (*glareola*) of wading birds (order *grallatores*) of the plover family (*charadriidæ*) found in the temperate and warmer parts of the old world. They frequent the borders of rivers, lakes, and marshes, and feed upon worms and insects, picking them up or capturing them in the air. They are swift either upon the foot or wing. The nest is made upon the ground among thick grass or shrubs, and they lay from three to four eggs. Most of the species are about 9 in. long, from beak to end of tail.

PRATIQUE is, strictly, a limited quarantine. A ship is said to have performed pratique when her captain has convinced the authorities of a port that his ship is free from contagious disease; and he is thereupon permitted to open trade and communication with the shore.

PRA'TO—often, for distinction, called **PRATO IN TOSCANA**—a t. of Italy, in the province of Florence (*Firenze*), 10 m. n.w. of Florence, in a fertile plain, on the right bank of the Bisenzio, a feeder of the Arno, and on the railway between Florence and Pistoja. There are manufactures of straw-plait, woolen cloth, cotton goods, silk thread, etc.; also soap-works, tanneries, and copper-works. Copper-mines of considerable productiveness exist in the neighborhood. Pop. '71, 12,900.

PRATT, an unorganized co. in s.w. Dakota, drained by White river; about 3,000 sq. miles.

PRATT, a co. in s. Kansas, watered by the Ninnescah and other branches of the Arkansas river; about 950 sq.m.; pop. '80, 1890—1749 of American birth. The surface is level, with little timber. The soil is fertile. The principal productions are corn, wheat, oats, rye, and grass. Co. seat, Prattsville.

PRATT, BENJAMIN, 1710-63; b. Cohasset, Mass.; graduate of Harvard university, 1737; studied law; rose rapidly in his profession and became a distinguished member of the bar. He represented the district of Boston (which he had made his home) in the Massachusetts general court, 1757-59, and subsequently through his intimacy with gov. Pownall received the appointment of chief-justice of New York. He married the daughter of judge Robert Auchmuty, then a resident of Roxbury. He was a profound scholar and painstaking collector of historical data, which he intended to publish as a history of New England, but his death took place while the work was incomplete.

PRATT, CHARLES. See **CAMDEN, EARL OF, ante**.

PRATT, DANIEL JOHNSON, PH.D., b. Westmoreland, N. Y., 1827; graduate of Hamilton college, 1851; had charge of the Fredonia academy for ten years, and became assistant secretary to the regents of the university of New York. In 1869 he was recording secretary of the Albany institute. The plan of the annual meeting of all the professors in the colleges and academic institutions in New York, which has proved of great advantage to the cause of education, originated with him. He wrote the *Annals of Public Education in the State of New York from 1626 to 1800*; and was one of the authors of the *History of the Boundaries of the State of New York*, 2 vols. He has also published several pamphlets on historical and educational subjects.

PRATT, ORSON, b. Conn., 1811; joined the Mormon church, and is now one of the 12 apostles; professor of mathematics in Deseret university, and church historian; has been for several years speaker of the Utah house of representatives. He is the author of *Cubic and Bi-Quadratic Equations; The Great First Cause; The Absurdities of Immaterialism*; and some religious pamphlets.

PRATT, PHINEAS, 1590-1680; b. England; came with Weston's colony to New England in 1622, and settled at the place afterward called Weymouth; left it in 1623 on the failure of the colony, and fled to Plymouth, 30 m. distant, pursued by the Indians. He resided many years in the Plymouth colony, and afterward in Charlestown, Mass. In 1662 he addressed a petition to the general court, accompanied with a narrative which he called *A Declaration of the Affairs of the English People that first Inhabited New England*. He was the ancestor of a large New England family.

PRATT, ZADOCK, 1790-1871; b. New York; began business in 1812 as a saddler and harness-maker; in 1817 devoted himself with success to tanning, and in 1824 located

a tannery in the place which is now Prattsville. In 1836 and again in 1842 he was elected to congress, where he exerted himself for the reduction of postage, and for the new post-office buildings. To him the bureau of statistics owes its origin.

PRAWN, *Pulamon*, a genus of crustaceans, of the order *decapoda*, and sub-order *macroura*, in general form resembling lobsters, crayfish, and shrimps, but belonging to a family (*palaemonidae*) remarkable for a long serrated beak projecting from the carapace. The upper antennae are terminated by three filaments. There are many species of prawn, and some of those which inhabit the seas of warm climates attain a large size. Many of them are semi-transparent, and exhibit very fine colors; they are also very active creatures, and most interesting inmates of an aquarium, but are excessively voracious, and apt to make great havoc among its other inhabitants. The COMMON PRAWN (*P. serratus*) attains a length of 3 or 4 in. It is common on the British coasts, although not so abundant as the shrimp, and is generally taken in the vicinity of rocks at a little distance from the shore, and not in rock-pools. It is more esteemed for the table than even the shrimp. Osier-baskets, similar to those employed for catching lobsters, are employed for the capture of prawns; also nets about 5 or 6 ft. wide, which are pushed along by means of poles, and are called *putting nets*. One side of the thorax of a prawn is often found remarkably distended. This is owing to a parasitic crustacean, *bopyrus crangorum*, one of the *isopoda*, lodged under the carapace.

PRAXITELLES, a celebrated sculptor of ancient Greece, of whose life nothing is known, except that he was a citizen of Athens, and lived in the 4th c. B. C. Pliny gives the date 364 B. C. apparently as that in which Praxitelés began to flourish. His principal works—all of which have now perished—were: 1. Statues of Aphrodite (at Cos, Cnidus, Thespiæ, Latmian Alexandria, and Rome), of which that of Cnidus was the most famous; 2. Statues of Eros (at Thespiæ, and Parium on the Propontis); 3. Statues, single and in groups, from the mythology of Dionysus (at Elis, Athens, Megara, and other places); 4. Statues of Apollo, the best of which was that representing Apollo as the lizard-slayer. So far as we are entitled to form an opinion of the works of Praxitelés from the descriptions and criticisms of ancient writers, it would seem that they marked an epoch in the history of Greece—viz., the transition from the earnest, heroic, and reverential age preceding the Peloponnesian war, to the more corrupt and sensual times that followed it. The sculpture of Pheidias is inspired by a profound veneration for the majesty of the gods; that of Praxitelés sought to give expression to the looser and less divine conceptions of the national religion. The bewitching beauty of woman, and the intoxication of Bacchic pleasures, were his favorite subjects; but in his treatment of these, he displayed unrivaled sweetness, grace, and naturalness. His gods and goddesses were not very divine, but they were ideal figures of the fairest earthly loveliness.

PRAY, ISAAC CLARK, 1813–69; b. Boston; educated at Amherst college. He was on the staff of the *Journal of Commerce* and the *Herald* in Boston. He was a successful theatrical manager, and among the persons whom he trained for the stage was Charlotte Cushman. He appeared in a number of English and Irish theaters, and produced a successful play, *Virginus*, and a number of dramas and burlesques. He was the author of *Poems* (1837); *Book of the Drama* (1851); *Memoirs of James Gordon Bennett and his Times*; and other works.

PRAYER is a universally acknowledged part of the worship due to God; a simple and natural expression of dependence, which seems almost necessarily to follow from a belief in the existence of a god. Accordingly, we find it both where the object of worship is one supreme Being and in systems of polytheism. It is also combined with every other part of worship. According to the Christian system, however, prayer is not the mere spontaneous approach of man to God, in the endeavor to appease his wrath, to win his favor, or to obtain from him any blessing; but the right to approach him in prayer, and the warrant to expect advantage in doing so rest on the revelation of his own will. Nor is any truth more indisputably taught in the Bible, or more frequently brought into view, both in the Old and in the New Testament, than that God is the *hearer* of prayer.

But a difficulty presents itself, in respect to what may be called the theory of prayer. How can prayer be supposed to influence the divine mind or will? How can a belief in its power be reconciled with any view of the divine decrees, from the most absolute doctrine of predestination to the most modified scheme which recognizes the Creator as supreme in the universe? Such questions bring up the same difficulty which attends all other questions of the relations between the human will and the divine, the freedom of man and the sovereignty of God. But whatever seeming inconsistencies may be implied in speculation concerning them, the necessity of prayer and the power of prayer are acknowledged equally by men of the most opposite views; and generally with an acknowledgment of the inability of the human mind to solve some of the problems which are thus presented to it. The extreme predestinarian includes prayer among the means decreed of God along with the end to which it contributes. And while prayer is regarded by all Christians as of great value in its reflex influence on the feelings of the worshiper, this is scarcely ever stated as its whole value; however important this view of it may be deemed as illustrating the divine wisdom in making it one of the chief "means of grace."

Prayer being regarded by Christians as an *ordinance* of God, it follows that they must seek to be guided in prayer by the rules of his revealed will, in so far as his will, has been revealed. It is therefore held by Christians in general, in accordance with their doctrine of the atonement (q.v.) and of the intercession (q.v.) of Jesus Christ, that the only true way of access to God is through the mediation of Jesus Christ, and that prayer must be made in the exercise of faith in him; the worshiper taking his stand upon the ground of the obedience or "finished work and accepted sacrifice" of Christ, and looking up to Christ as now interceding in heaven. It is also held, in accordance with the doctrine of man's corruption, that prayer can be truly made, in faith, and for things agreeable to God's will, only by the help of the Holy Spirit. Prayer, to be acceptable, must be for things agreeable to God's will, as that will is revealed in his Word; and therefore prayer for mere temporal or earthly good must be made in entire submission to his will; but prayer may be thus made for temporal or earthly good, the will of God having been revealed to that effect—an admirable instance of the grace of God.

Adoration, thanksgiving, and confession of sins, the accompaniments or adjuncts of prayer, are very generally regarded as parts of prayer; and prayer, which is strictly mere *petition*, is defined accordingly.

The Protestant churches all hold that prayer is to be made to God alone; the mediation of Jesus Christ and the help of the Holy Ghost being duly acknowledged. But in the Roman Catholic church, and to some extent in the oriental churches, prayer of a kind is made also to saints, the virgin Mary, and angels. See *INVOCATION*.

Prayer, according to Christians in general, must be made not merely in forms or words, but with the heart. Accordingly, Protestants hold that prayer ought to be conducted in a language known to the worshipers. The church of Rome has, on the contrary, maintained the general use of the Latin language, where that language is unknown to most of the worshipers.

Prayer for the dead (see following article) is rejected by Protestants, as having no warrant in the Word of God. But according to the Protestant creed, prayer is to be made for all the living—not only for believers but for unbelievers.

PRAYER FOR THE DEAD, the practice which prevails in the Roman Catholic, Greek, and other oriental churches of praying for the souls of the deceased, with the intention and expectation of obtaining for them an alleviation of their supposed sufferings after death; on account of venial sins, or of the penalty of mortal sins, remitted but not fully atoned for during life. The practice of praying for the dead supposes the doctrine of purgatory (q.v.), although perhaps the converse is not necessarily true. Practically, however, the two may be regarded as forming part of one and the same theory, and especially if taken in connection with the doctrine of the communion of saints. It being once supposed, as the Roman Catholic system supposes, that relations subsist between the two worlds, that their members may mutually assist each other, it is almost a necessary consequence of the doctrine of purgatory that the living ought to pray for the relief of their suffering brethren beyond the grave. We can but present an outline of this doctrine and of its history. It seems certain that some such doctrine existed in most of the ancient religions, and especially in those of Egypt, India, and China. It gives significance to many of the practices of the Greeks and Romans in reference to their dead. Its existence among the Jews is attested by the well-known assurance in 2d Maccabees, chap. xii., that "it is a holy and wholesome thought to pray for the dead, that they may be loosed from their sins." The continued maintenance of the practice among the Jewish race is plain from their sacred books; and a still more interesting evidence of its use has recently been discovered in the inscriptions disinterred in several Jewish catacombs of the first three centuries, at Rome and in southern Italy, which abound with supplications: "May thy sleep be in peace!" "Mayest thou sleep in peace!" "Thy sleep be with the good!" or "with the just!" etc. Roman Catholics contend that the doctrine, as well as the practice, is equally recognizable in the early Christian church. They rely on the parable of Lazarus and the rich man (Luke xvi. 19-31) as establishing the intercommunion of this earth with the world beyond the grave; and on Matt. xii. 32, as proving the remissibility of sin or of punishment after death; as well as on 1st. Cor. xv. 29, as attesting the actual practice, among the first Christians, of performing or undergoing certain ministrations in behalf of the dead. The fathers of the 2d, 3d, and still more of the 4th and following centuries, frequently allude to such prayers, as Clement of Alexandria, Tertullian, St. Cyprian, and especially St. John Chrysostom, Cyril of Jerusalem, and St. Augustine. The liturgies, too, of all the rites without exception contain prayers for the dead; and the sepulchral inscriptions from the catacombs, which reach in their range from the 1st till the 5th c., contain frequent prayers in even greater variety, and more directly intercessory, or rather more directly implying release from suffering than those of the contemporary Jews. In the services of the mediæval and later church, prayers for the dead form a prominent and striking element. See *REQUIEM*. The Abyssinians have separate services for the dead of all the several conditions and degrees in life, and continue to offer the mass daily for 40 days after the death. The Protestant churches without exception have repudiated the practice. In the burial-service of the first book of common prayer, authorized in the church of England, some prayers for the deceased were retained; but they were

expunged from the second book; and no trace is to be found in that sanctioned under Elizabeth.

PRE-ADAMITES, supposed inhabitants of the earth anterior to Adam. The author of the opinion, or at least the writer in whose hands it first took a scientific form, was Isaac de la Peyrere, better known by his Latinized name *Pererius*. He was born of a Calvinist family of Bordeaux in 1594, and was attached to the service of the prince of Condé. His theory was first made public in 1655, in the form of a commentary on the 12th, 13th, and 14th verses of the 5th chapter of St. Paul's Epistle to the Romans, which was followed, in the same year, by the first part of a formal treatise on the pre-Adamite hypothesis, and the theological consequences to be derived therefrom. According to his hypothesis Adam was the progenitor of the Jewish race only, and it is only of him and his race that the Bible is designed to supply the history. Other races existed on earth before that of Adam; but of them the Bible contains no record, nor did the Mosaic law regard them or impose any obligation upon them. It was only under the gospel that they began to be comprehended in the law, which through Christ was given to all the human races of the earth; and it is in this sense that, according to Peyrere, sin is said (Rom. v. 13) to "have been in the world until the law," but not to have been "imputed when the law was not." For the pre-Adamite race, as the law was not, there was no *legal* offense. The only evil which Peyrere recognized was natural evil. The same limited interpretation he extended to most other details of the Mosaic history. Thus he regarded the deluge as partial, being confined only to the Adamite race. Other miraculous narratives of the Pentateuch and even of other books he restricted similarly. As his book was published in the Low Countries he fell under the animadversion of the inquisition, and eventually was arrested in the diocese of Mechlin, but was released at the instance of the prince of Condé. He afterward went to Rome, where he conformed to the Catholic religion, and made a full retraction of his erroneous opinions. He was offered preferment by the pope, Alexander VII.; but returned in preference to Paris, where he entered the seminary of Notre Dame des Vertus, in which he resided till his death in 1676. The discussion has acquired new interest by recent discoveries of supposed evidences of human art and industry, in positions which, considered geologically, appear to their discoverers to be of an age beyond those limits which the Mosaic chronology assigns to the creation of Adam.

PREBEND (Lat. *præbenda*, from *præbere*, to furnish), the income or other provision assigned for the maintenance of a so-called prebendary, out of the revenue of a cathedral or collegiate church. After the definite constitution of chapters for the maintenance of the daily religious services in the bishop's church, or in other churches similarly established, endowments were assigned to them, which were to be distributed (*præbendæ*) in fixed proportions among the members. These portions were called *portiones canonicæ* or *præbendæ*. To the prebend was commonly attached a residence. The person enjoying a prebend is called a prebendary.—The name prebend is also given to an endowment assigned to a cathedral church for the maintenance of a secular priest.

PREBLE, a co. in s.w. Ohio, bordering on Indiana on the w.; drained by several creeks, and traversed by the Cincinnati, Richmond and Chicago, and the Dayton and Union railroads; 450 sq.m.; pop. '80, 24,534—23,509 of American birth. The soil is fertile; tobacco, corn, wheat, oats, wool, pork, and cattle are the staples. There are manufactures of lime, clothing, brick, and other articles. Co. seat, Eaton.

PREBLE, EDWARD, 1761-1807; b. Maine; joined a privateer 1777, and 2 years later, entered the Massachusetts navy. He was captured and imprisoned on the *Jersey* in New York harbor; and from the time of his release till the close of the war was on the *Winthrop*. While attached to this vessel, he boarded, with only 14 men, a British brig, at Castine, Maine, and took her out in the face of a battery. In 1799 he was appointed capt., and in command of the *Essex* convoyed from Batavia a fleet of merchant vessels. In 1803 he commanded the squadron against Tripoli, and in November of that year, began the blockade of Tripoli. He attacked the Tripolitan gun-boats, Aug. 3, 1804, captured 3, and sunk 3. Four days later, he made another attack, but lost one of his own gun-boats. On the 28th of the same month, 8 American boats fought 13 Tripolitan, sinking 1 of the latter, and driving 1 ashore. The Tripolitans succeeded in raising their vessels which had been sunk, before Preble again attacked them, Sept. 3. He stationed his flag ship the *Constitution*, where 70 guns bore upon her, and she was finally obliged to retire. A large quantity of powder, shell, and shot was put on the *Intrepid*, and she was taken by a force of volunteers into the harbor to be exploded. She was, however, fired upon by the batteries, and prematurely exploded. All on board were killed. The Tripolitans lost 1 gun-boat, but the American loss was proportionately much greater. A few days afterward, Preble was relieved by commodore Barron.

PREBLE, GEORGE HENRY, b. Maine, 1816; entered the navy in 1835. He was made lieutenant in 1848, after serving in the Seminole and Mexican wars. He was in the attack on Alvarado in 1846, and at Tampico and Vera Cruz the next year. In 1854, in command of the sloop *Macedonian* he fought the Chinese pirates. During the war of the rebellion he was in command of the *Katahdin* at the capture of New Orleans; and of the *St.*

Louis, in the blockade squadron 1863-65. He was promoted capt. in 1867, and commodore in 1871. He is the author of a *History of the American Flag*, 1872.

PREBLE, JEDEDIAH, 1707-84, b. Maine; removed to Portland, 1748. He was a capt. in the regiment of gen. Samuel Waldo, 1746; went to Acadia as a lieut.col. with gen. Winslow in 1755, and was made brig.gen., 1759. He was for a number of years a member of the state house of representatives, served in the state and executive council, and was appointed a justice of the court of common pleas in 1778.

PRECEDENCE, the order in which individuals are entitled to follow one another in a state procession or on other public occasions. We find questions of precedence arising in very early ages both in Europe and in the east. Where such questions have arisen among ambassadors, as the representatives of different countries, great tenacity has often been shown in supporting the claims to rank of the states represented. In England, the order of precedence depends partly on the statute 31 Henry VIII. c. 10, partly on subsequent statutes, royal letters patent, and ancient usages. Among questions of precedence depending on usage, there are some which can hardly be considered so settled as to be matter of right, and are in a great degree left to the discretion of the officers of the crown. Formerly, they were adjudicated on by the constable and marshal in the court of chivalry; and since that tribunal has fallen into abeyance, the practice of persons aggrieved in these matters is to petition the crown, which generally refers the disputed question to the officers of arms. In Scotland, the Lyon court has the direct jurisdiction in all questions of precedence.

It is a general rule of precedence, that persons of the same rank follow according to the order of the creation of that rank; and in the precedence of the English peerage, it has been fixed that the younger sons of each preceding rank take place immediately after the eldest son of the next succeeding rank. Married women and widows take the same rank among each other as their husbands, except such rank be professional or official, and it is an invariable rule that no office gives rank to the wife or children of the holder of it. Unmarried women take the same rank with their eldest brother; the wife of the eldest son, of any degree, however, preceding the sisters of her husband and all other ladies in the same degree with them. Marriage with an inferior does not take away the precedence which a woman enjoys by birth or creation; with this exception, that the wife of a peer always takes her rank from her husband. The following tables exhibit the precedence of different ranks as recognized by law in England.

TABLE OF PRECEDENCE AMONG MEN.

The sovereign.	
The prince of Wales.	
Sons of the sovereign.	
Grandsons of the sovereign.	
Brothers of the sovereign.	
Uncles of the sovereign.	
The sovereign's brothers' or sisters' sons.	
The archbishop of Canterbury, primate of all England.	
The lord high chancellor, or lord keeper, being a baron.	
The archbishop of York, primate of England.	
The present archbishop of Armagh, by the Irish church act (1869).	
The archbishop of Dublin.	
The lord high treasurer.	
The lord president of the privy council.	} Being of the degree of barons.
The lord privy seal.	
The lord great chamberlain.	} Above all of their degree; if dukes, above all dukes, etc.
The lord high constable.	
The earl marshal.	
The lord high admiral.	
The lord steward of her majesty's household.	
The lord chamberlain of her majesty's household.	
Dukes.	
Eldest sons of dukes of the blood royal.	
Marquises.	
Dukes' eldest sons.	
Earls.	
Younger sons of dukes of the blood royal.	
Marquises' eldest sons.	
Dukes' younger sons.	
Viscounts.	
Earls' eldest sons.	
Marquises' younger sons.	
Bishops of London, Durham, and Winchester.	
All other English bishops according to seniority of consecration.	
The present bishop of Meath, and then the other Irish bishops existing in 1869, according to seniority of consecration.	
Secretaries of state, if of degree of a baron.	
Barons.	
The speaker of the house of commons.	
Commissioners of the great seal.	
Treasurer of her majesty's household.	
Comptroller of her majesty's household.	
Master of the horse.	
Vice-chamberlain of her majesty's household.	
Secretaries of state, under the degree of baron.	
Viscounts' eldest sons.	
Earls' younger sons.	

Barons' eldest sons.
 Knights of the garter.
 Privy councilors
 The chancellor of the order of the garter.
 The chancellor of the exchequer.
 The chancellor of the duchy of Lancaster.
 The lord chief justice of the queen's bench.
 The master of the rolls.
 Lord chief justice of the common pleas.
 Lord chief baron of the exchequer.
 Lords justices of the court of appeal in chancery.
 Vice-chancellors.
 Judges and barons of the degree of the coil of the said courts, and judge of the court of probate.
 Bannerets made by the sovereign under the royal standard in open war.
 Viscounts' younger sons.
 Barons' younger sons.
 Baronets.
 Bannerets not made by the sovereign in person.
 Knights grand crosses of the bath.
 Knights grand crosses of the star of India.
 Knights of St. Patrick.
 Knights grand crosses of St. Michael and St. George.
 Knights commanders of the Bath.
 Knights commanders of the star of India.
 Knights commanders of St. Michael and St. George.
 Knights bachelors.
 Companions of the bath.
 Companions of the star of India.
 Cavalieri and Companions of St. Michael and St. George.
 Eldest sons of the younger sons of peers.
 Baronets' eldest sons.
 Eldest sons of knights of the garter.
 Bannerets' eldest sons.
 Eldest sons of knights of the bath, and of St. Michael, and St. George.
 Eldest sons of knights bachelors.
 Baronets' younger sons.
 Younger sons of knights of the garter.
 Younger sons of bannerets.
 Younger sons of knights of the bath.
 Younger sons of knights bachelors.
 Esquires.
 Gentlemen entitled to bear arms.
 Clergymen, barristers-at-law, officers in the army and navy, who are all gentlemen, and have their precedence in their respective professions.
 Citizens.
 Burgesses.

TABLE OF PRECEDENCE AMONG WOMEN.

The queen.
 The princess of Wales.
 Princesses, daughters of the sovereign.
 Princesses and duchesses, wives of the sovereign's sons.
 Granddaughters of the sovereign.
 Wives of the sovereign's grandsons.
 The sovereign's sisters.
 Wives of the sovereign's brothers.
 The sovereign's aunts.
 Wives of the sovereign's uncles.
 Duchesses.
 Wives of the eldest sons of dukes of the blood royal.
 Daughters of dukes of the blood royal.
 Marchionesses.
 Wives of the eldest sons of dukes.
 Daughters of dukes.
 Countesses.
 Wives of the younger sons of dukes of the blood royal.
 Wives of the eldest sons of marquises.
 Daughters of marquises.
 Wives of the younger sons of dukes.
 Viscountesses.
 Wives of the eldest sons of earls.
 Daughters of earls.
 Wives of the younger sons of marquises.
 Baronesses.
 Wives of the eldest sons of viscounts.
 Daughters of viscounts.
 Wives of the younger sons of earls.
 Wives of the eldest sons of barons.
 Daughters of barons.
 Maids of honor.
 Wives of knights of the garter.
 Wives of bannerets.
 Wives of the younger sons of viscounts.
 Wives of the younger sons of barons.
 Wives of baronets.
 Wives of knights grand crosses of the order of the bath.
 Wives of knights grand crosses of St. Michael and St. George.
 Wives of knights commanders of the order of the bath.
 Wives of knights commanders of St. Michael and St. George.
 Wives of knights bachelors.
 Wives of companions of bath.
 Wives of cavalieri and companions of St. Michael and St. George.
 Wives of the eldest sons of the younger sons of peers.
 Daughters of the younger sons of peers.

Wives of the eldest sons of baronets.
 Daughters of baronets.
 Wives of the eldest sons of knights of the garter.
 Daughters of knights of the garter.
 Wives of the eldest sons of bannerets.
 Daughters of bannerets.
 Wives of the eldest sons of knights of the bath.
 Daughters of knights of the bath.
 Wives of the eldest sons of knights bachelors.
 Daughters of knights bachelors.
 Wives of the younger sons of baronets.
 Wives of esquires and gentlemen.
 Wives of citizens.
 Wives of burgesses.

At the coronation of Charles I., the rule of precedence of the nobility of England was introduced in Scotland; and it was arranged that peers of England (or their sons, etc.), of a given degree, should within England take precedence of peers of Scotland of the same degree; and that this precedence should be reversed in Scotland. But by the acts of union of Scotland and Ireland, the precedence in any given degree of the peerage has been established as follows: 1. Peers of England; 2. Peers of Scotland; 3. Peers of Great Britain; 4. Peers of Ireland; 5. Peers of the United Kingdom, and peers of Ireland created subsequently to the Irish union. A similar order is understood to obtain in regard to baronets, though in Ireland it seems lately to have become the practice to allow all baronets to rank according to the respective dates of their patents. The relative ranking of the great officers of the crown in Scotland was thus settled by statute in 1623 and 1661:

Lord chancellor.
 Lord treasurer.
 Archbishop of St. Andrews.
 Archbishop of Glasgow.
 Earls and viscounts according to their ranks.
 Bishops according to their ranks.
 Lord privy seal, (first of their rank.
 Lord secretary, (
 Lord president of the court of session.
 Lord register.
 Lord advocate.
 Lord justice clerk.
 Lord treasurer depute.
 Lords of session, according to their admission.
 Barons and gentlemen, being councillors, according to their admission.

The right of the judges of the court of session, in Scotland, to precede baronets has been generally admitted. Lyon king of arms has precedence "before all knights and gentlemen within the kingdom, not being officers of state, or senators of the college of justice." It seems to be held in England that the precedence of Scotch officers of state, judges, etc., as recognized before the union, does not now extend beyond Scotland.

There are rules for precedence for the members of different professions, recognized among themselves, but which do not confer general social precedence. Doctors in the universities rank thus: 1. Of divinity; 2. Of law; 3. Of medicine.

PRECEDENTS, in law; legal acts or instruments which, as establishing a point of law, are to be followed in subsequent cases in which analogous facts occur. Forms of procedure long used by the courts or the profession also are called precedents. In respect to the action of courts, precedent means an "adjudged case followed by a court in subsequent cases." Blackstone says that a previous decision is to be followed, unless "manifestly absurd or unjust." Among the considerations which go toward determining whether a decision be accepted as a precedent are "the justice of its principle, and the reasonableness of its application, the time during which it has been unquestioned, the general course of the decisions," etc. Lord Talbot said, it is much better to stick to the known general rules than to follow any one particular precedent.

PRECENTOR (Lat. *præ*, before; and *cantor*, a singer), the official in a chapter, whether cathedral or collegiate, whose duty it was to lead the singing. He commenced the psalm or hymn, which was taken up, and repeated either by the celebrant or another of the body, or by the rest of the choir. In modern chapters, the precentor ranks next in dignity to the provost or dean. Among the Presbyterian bodies, the precentor is the official who raises and conducts the psalmody, and is generally provided with a desk immediately beneath the pulpit.

PRECEPT, a legal term, used in Scotch law, in certain departments, generally signifies an order to do something. Thus, a precept of sasine is an order by the superior of lands to his bailie to infest the vassal. A precept of *clare constat* is an order by a superior to infest the vassal's heir, so called because the superior is quite satisfied of the propinquity.

PRECEPTORY, the name given to certain houses of the knights templar, the superiors of which were called knights preceptor. All the preceptories of a province were subject to a provincial superior, called grand preceptor; and there were three of these who held rank above all the rest, the grand preceptors of Jerusalem, Tripolis, and Antioch. Other houses of the order were called "commanderies."

PRECESSION. If the earth were truly spherical and homogeneous; or if it were composed of spherical layers each of uniform density; or, more generally, if it were such that the resultant of the attractions exerted on all its parts by any other body should always pass through a definite point in its mass, its diurnal rotation would not be affected by the attraction of any other bodies. If originally rotating about a principal axis of inertia (q.v.), it would forever revolve about it, and the direction of the axis would remain fixed in space. To put this in more popular language, the pole-star (q.v.) would always be the same star. But, although the earth rotates about an axis almost exactly coinciding with its axis of figure, the attraction of various bodies, especially the sun and moon, on the oblate portion at the equator, tends to give it a rotation about an axis *in* the plane of the equator; and the combination of these two rotations gives rise to a shifting of the instantaneous axis of rotation in the earth and also in space. As already mentioned (see **NOTATION**), the earth's axis of revolution describes a waved curve (very nearly circular) about the pole of the ecliptic, and in a direction contrary to that of the order of the signs of the zodiac (q.v.). This waved curve may be conceived to be described as follows: The pole of the earth, P, revolves in about 19 years in a

little ellipse, whose center, O, travels uniformly in a small circle of the sphere, AO; the center, E, of the latter is the pole of the ecliptic. The precession is the portion AO of this circle measured from any assumed point, A; and the small arc, OP, by which the true place of the earth's pole differs from its mean place, is the nutation. The nutation is generally resolved along, and perpendicular to, EO; and the components so

found are the nutation in ecliptical latitude and longitude. This rough sketch is intended merely to show the *nature* of the phenomenon, for the curve described by P about O is only approximately elliptic. Its greatest radius-vector, however, is exceedingly small, amounting only to about eighteen *seconds* of arc. AO, also, is not exactly circular, but very nearly so, as its radius, EO, is the *obliquity of the ecliptic* (q.v.), which we know varies very little from the angle $23^{\circ} 28'$. The equinoxes, being 90° distant from E, and also from O, which may be taken as the mean place of P, are at \sphericalangle and φ in the diagram. And as O moves round E in the reverse order of the signs, so do the equinoxes, and in the same period—viz., 25,868 years. The effect is, of course, that while the earth's pole describes the small circle, AO, in the heavens, about the pole of the ecliptic, the equinoxes make one complete revolution in the ecliptic against the order of the signs. Thus, in turn, all stars lying near the circle AO become, each for a time, the *pole-star* (q.v.). It may seem strange that the term precession should be applied to a retrograde motion; but, from the point of view of the observer, it is evident that the equinox, if on one day it arrive at the meridian of a place simultaneously with a fixed star, will next day arrive at the meridian *sooner* than the star, or will precede it in time of transit; and this is the origin of the term.

The physical explanation of the cause of precession is almost identical with that of the conical motion of the axis of a top about the vertical; the difference between the two being that, in the case of the top, the conical rotation of the axis takes place in the *same* direction as the rotation of the top about the axis, while in the case of the earth, the pole of the axis turns about the pole of the ecliptic in the *opposite* direction to that in which the earth revolves about its axis. But the circumstances of the earth's motion are easily procured by a modification of the spinning-top, such as that of Troughton (used for the determination of latitudes at sea), if the center of gravity of the whole mass be depressed *below* the point of suspension. If the axis of a top be vertical, there is no precession; similarly, when the sun or moon is in the plane of the equator, no effect is produced by them on the position of the earth's axis. When the axis of the common top is inclined, gravity tends to make it fall over; in similar circumstances, it tends to restore the axis of Troughton's top to the vertical; in either case tending to give the top a rotation about a horizontal axis perpendicular to that about which it is at the instant rotating; and the effect on the top is to cause a slow conical motion of its axis about the vertical. The sun or moon, in like manner, when not in the plane of the equator, tend to make, by their attraction, the earth turn about an axis perpendicular to that about which it is actually rotating. It is the composition of these rotations which gives rise to precession; but, though it would not be difficult to give a satisfactory investigation of the question without using formidable mathematical methods, the length of such an investigation prevents our giving it here. The simplest approximation we can give to the physical explanation, that originally given by Newton, must therefore suffice. We have seen (see **PERTURBATIONS**) that the node of a satellite's orbit tends always to *regrede* on the plane of relative motion of the primary and the disturbing body. Suppose, for an instant, the protuberant parts of the earth at the equator to be satellites, revolving about a *spherical* earth. The effect of the sun's or moon's disturbing force upon these satellites would be to make the nodes of their orbits regrede. And exactly the same result

will follow if they be attached to the earth, only that the rate of regression will now be much slower, as the whole mass of the earth will share in the motion. This is one of the most ingenious of the wonderful series of explanations of celestial phenomena which were given in the *Principia*.

PRECIOUS STONES, a name almost synonymous with gems (q. v.) in its widest sense, and partially extended to stones of larger size employed for ornamental purposes, but not to those which are used in architecture.

PRECIPITATION, in chemistry, is an operation in which decomposition occurs in a fluid, either through the action of the air, or of a gas, or of a chemical agent in solution; and is accompanied by the deposition of a solid substance that was previously held in solution. The substance employed to produce the precipitation is called the *precipitant*, and the substance which is separated by its action the *precipitate*. For example, if a solution of carbonate of protoxide of iron be exposed to the air, a precipitate of hydrated sesquioxide or peroxide of iron speedily falls; if a current of sulphureted hydrogen gas be passed through a solution of acetate of lead, a black precipitate of sulphide of lead is thrown down from the clear and colorless solution; and if a solution of corrosive sublimate (bichloride of mercury) be added to a solution of iodide of potassium, a yellow precipitate of biniodide of mercury is thrown down. The precipitant must be added with caution, as, in many cases, an excess of it re-dissolves the precipitate. In qualitative analysis—that is to say, in determining the presence of substances without reference to their quantity—the color, solubility, etc., of the precipitate thrown down by numerous tests, as sulphureted hydrogen, solutions of nitrate of silver, iodide of potassium, ferro-cyanide of potassium, etc., afford the most useful information; and in quantitative analysis, the amount of precipitate thrown down from a given quantity of a solution is often employed to determine the strength of the latter. For example, if a solution of nitrate of silver is added to an ounce of a solution of hydrocyanic acid of unknown strength, till no further precipitation ensues, we may readily calculate, from the weight of the white precipitate of cyanide of silver, how much anhydrous hydrocyanic acid was present.

PRECOCITY has been regarded as an indication of cerebral disease; and American physicians have not hesitated to identify this manifestation with chronic inflammation of the membranes of the brain. If it is not always it is often associated with such intense activity of the whole system, and with morbid conditions, such as the scrofulous diathesis as to usher in actual disease, premature decay, and early death. The decay often consists in mental feebleness and fatuity; or, where no such formidable issue follows, in the reduction of what promised to be transcendent genius to commonplace mediocrity. The closing chapters of the history of many wonderful calculators—infant Rosciuses, infant Lyras, etc.—illustrate this. It is hence no mere poetic figure to say that the lamp of the mind lives upon and burns itself out. Yet there are numerous exceptions, such as Johnson, Mozart, Fergussou, Davy, where early genius grew into great and masculine powers. This rapid development in infancy or youth of faculties which are generally the result of protracted growth; and the intuitive acquisition of knowledge, which, under ordinary circumstances, is attained by laborious effort and cultivation, are most frequently witnessed in those of feeble and delicate constitution and of stunted frame. It is often seen as a concomitant of rickets, as in Pascal, Pope, etc.; and the dux of the school may often be pointed out from the disproportionate size of his head. While this development includes marvelous exercise of memory, of imagination, of constructive talent, of artistic genius, it rarely extends to judgment, reasoning, and sagacity. There appears to be evidence that this quality is not merely morbid, but that it exercises, reflexly, a detrimental influence upon healthy assimilation and growth, and arrests or retards that building up of the organization, upon which the ultimate capacity and usefulness of the individual depend. Education sometimes produces such prematurity, or fosters it where it has previously existed; so that the modern form of mental exhaustion, "the overworked brain," may be said to originate in the school-room. It is certainly illogical to employ this fact, as has been done, against infant schools; but it is incumbent to keep such a relation in view in all educational efforts; to avoid high pressure and stimulation, to adapt the kind of instruction to the age, and, so far as may be practicable, to the strength and tendencies of the pupils; and to combine systematic physical with all intellectual training.—Brigham, *Remarks on the Influence of Mental Cultivation and Mental Excitement upon Health*; Combe, *On the Management of Infancy*; Caldwell, *Thoughts on Physical Education*.

PRECOGNITION, a Scotch legal term, which denotes the heads or substance of the evidence which a witness in a criminal cause proposes to give at the trial. In all cases, before a trial, it is necessary for the solicitor to see the witnesses, and elicit from them the nature of the testimony they can give; and the heads of this testimony are called the precognitions, when written out. But the word has a technical meaning when applied to the examination of the witnesses before a justice of the peace or the judge-ordinary by the procurator-fiscal, previous to, and by way of enabling him to know how to frame, the charge. On such an occasion the witnesses are examined or precognosed, a proceeding which corresponds to the evidence given in England before a magistrate or justices of the peace, and called there the depositions.

FREDESTINATION, a theological word, used to denote the eternal decree of God, whereby "the elect" are foreordained to salvation. The correlative decree, whereby others are held to be foreordained to perdition (though it might with perfect correctness of language be included under the same term), is commonly distinguished by the other term, reprobation.

The theory of predestination had, like the doctrine of election (q.v.), its origin in the attempts of the theological system to define the relations of the human and the divine will, and to reconcile the phenomena of human freedom with the belief in divine omnipotence. God's absolute will is represented by it as determining the eternal destiny of man, not according to the foreknown character of those whose fate is so determined, but according to God's own mere choice. They who are thus foreordained to eternal life are led to believe and live by the "irresistible grace" of the Holy Spirit. In human salvation, therefore, *God's will* is everything; *man's*, nothing. It was in the discussions between Pelagius and Augustine that the predestinarian view of the divine "decree" was first fully evolved; and since their time opinion in the church has run in two great currents—the one perpetuating the influence of Pelagius, who regarded that decree as subordinated to the divine foreknowledge of human character; the other, that of Augustine, who maintained the absolutism of that decree and its independence of all prior human conditions. Pelagius recognized a possibility of good in human nature; Augustine denied any such possibility, apart from the influences of divine grace. The one held that the choice of salvation lay in man's will; the other, that man's will had no active freedom or power of choice since the fall. In 529, the system of Augustine was established by the council of Arausio (Orange) as the rule of orthodoxy in the western church; but the reaction against the strictly logical, yet essentially *unmoral*, nature of his dogma has been perpetually manifested by representatives of the more humane, though, perhaps, less logical doctrine of Pelagius, in every period of the church. In the days of the schoolmen, the discussions of the Scotists and Thomists—after the reformation, the contests leading to the condemnation of Arminius in the council of Dort, and the widening separation that now divides the disciples of Calvin from those theologians who hold broader and freer views on the subject of the *atonement*—indicate the impossibility of the human reason and conscience ever resting satisfied with a merely and absolutely logical theory of the relations between the will of God and the moral responsibility of man. The tendency of modern inquiry seems to be to abandon the discussion of a point so obviously incapable of being determined by human intelligence, and to pursue, instead, examination into the moral and practical bearing upon our human conditions of that which we are able to learn concerning God and his will. The moral meaning of that will is of vital moment to men; the extent of its power over their own wills they, apparently, cannot determine.

PREDICABLES. This is a term in the scholastic logic connected with the scheme of classification. There were five designations employed in classifying objects on a systematic plan—*genus*, *species*, *difference* (differentia), *property* (proprium), and *accident* (accidens). The first two—genus and species—name the higher and lower classes of the things classified; a genus comprehends several species. The other three designations—difference, property, accident—express the attributes that the classification turns upon. The difference is what distinguishes one species from the other species of the same genus; as, for example, the peculiarities wherein the cat differs from the tiger, lion, and other species of the genus *felis*. The property expresses a distinction that is not ultimate, but a consequence of some other peculiarity. Thus, "the use of tools" is a property of man, and not a difference, for it flows from other assignable attributes of his bodily and mental organization, or from the specific differences that characterize him. The accident is something not bound up with the nature of the species, but chancing to be present in it. For instance, the high value of gold is an accident; gold would still be gold though it were plenty and cheap.

It was by an arbitrary and confusing employment of the notion of predication that these various items of the first attempt at a process of systematic classification were called predicables, or attributes that might be "predicated," that is, affirmed of things. All that is needful to affirm is that a certain thing belongs to a given species or genus; and that to belong to the species is to possess the specific differences, and to belong to the genus is to possess the generic differences. We may also, if we please, *affirm* (or predicate) that the thing does belong to the species, or does possess the specific difference; but this power of affirming has no need to be formally proclaimed, or made the basis of the whole scheme.

The allied term "predicament" is another case where an abusive prominence is given to the idea of predication. The predicaments, or categories, were the most comprehensive classes of all existing things—under such heads as substance, attribute, quantity, quality, etc., and it could be predicated of anything falling under any one head that it does so fall under. Thus, "virtue" is an attribute, and therefore we might say that "attribute" can be *predicated* of "virtue." But the notion of predicating does not indicate the main fact of the process in this case, any more than "predicable" in the foregoing. *Classification*, and not predication, is the ruling idea in each.

PREDICATE. See PROPOSITION.

PRE-ESTABLISHED HARMONY. See **LEIBNITZ.**

PRE-EXISTENCE, DOCTRINE OF. The notion that human souls were in existence before the generation of the bodies with which they are united in this world was anciently, and is still, widely spread throughout the east. The Greek philosophers too, especially those who held the doctrine of transmigration (q. v.), as the Pythagoreans, Empedocles, and even Plato—if with him pre-existence is not simply a symbolical myth—were familiar with the conception. Among the early Christians, the assumption of such pre-existence was connected with the belief that God had created the souls of men before the world, and that these were united with human bodies at generation or at birth. Subsequently, the followers of this opinion were termed *pre-existenceists*, to distinguish them from the *traducianists*, who held that children received soul as well as body from their parents. Direct intellectual interest in this doctrine has nearly altogether ceased in modern times, yet the dream—for whether true or false, it is and can be nothing but a dream in our present state, and with our present capabilities of knowledge—has again and again haunted individual thinkers. Wordsworth has given poetical expression to it in his famous ode—*Intimations of Immortality from Recollections of Early Childhood*:

Our birth is but a sleep and a forgetting,
The soul that rises with us—our life's star,
Hath had elsewhere its setting,
And cometh from afar,
Not in entire forgetfulness,
And not in utter nakedness,
But trailing clouds of glory do we come
From God, who is our home.

Nor must we overlook the fact, that the latest philosophy of Germany—that of the younger Fichte, has revived the doctrine; while it forms the basis of one of the deepest works in modern theology, that of Julius Müller, *Die Christliche Lehre von der Sünde* (The Christian Doctrine of Sin. English, Edin. 1856).

PREFECT, a common name applicable to various Roman functionaries. The most important was the *præfectus urbi*, or warden of the city, whose office existed at an early period of Roman history, but was revived under Augustus, with new and greatly altered and extended authority, including the whole powers necessary for the maintenance of peace and order in the city, and an extensive jurisdiction civil and criminal. The *præfectus pratorio* was the commander of the troops that guarded the emperor's person.

PREFET, the name of an important magistrate in modern France, so called from his exercising functions somewhat similar to those of the *præfectus urbi* at Rome. See **PRE-FECT.** In old times, the officers whose duty it was to superintend the details of administration in the provinces were called *maîtres des requêtes*. Under Henry II., their office was rendered permanent; and at a later period, their powers were much extended, and they were known by the designation of *intendants*. The *intendants* were abolished at the revolution; and a law of 1800 first appointed *préfets* for the departments, with powers greatly similar to those of the *intendants*. The office, as it now exists, includes the superintendence of the police establishment, the enforcement of the laws, and the entire control of the administration of the departments. The *préfet* is the head of the executive, exercises most of the government patronage, including the appointment of a *sous-préfet* for each *arrondissement*, and in time of tumult may call out the military, or provisionally declare a state of siege. The chief check on these extensive powers is to be found in the *conseil de la préfecture*, which acts in some measure as a court of appeal from the decisions of the *préfet*.

PREGEL, a river of Prussia, rises in the province of e. Prussia, where it is formed by the union of the Pissa and the Angerap near Insterburg. It flows almost due west past Wellau and Königsberg, and after a course of more than 90 m., enters the Frisches Haff, about 6 m. below the latter town. The Pregel is navigable even at Insterburg, and at Königsberg, is 720 ft. broad. Its principal tributaries are the Alle from the south, and the Inster from the north. The canal of Deine connects it with the Kurisches Haff.

PREGNANCY. See **MIDWIFERY, ante.**

PREGNANCY, CONCEALMENT OF, is a criminal offense, or rather it is taken to be the main proof of the offense of concealing the birth of a child in certain circumstances. It is only where the child is dead and has been secretly disposed of under suspicious circumstances, that the mother is punishable. Hence, the offense consists in endeavoring to conceal the birth, and, as part of such concealment, to conceal the pregnancy, the child having already died. If the woman failed to give publicity of her situation beforehand, it is presumed this was done from the improper motive, viz., to murder or destroy the child. To complete the offense, it is not necessary that the child should have been born alive; but if the child can be shown never to have lived, the prisoner must be acquitted. A usual test of concealment is, that the mother made no preparations for her delivery, nor provided child's clothes.

PREATITE, a mineral, composed chiefly of silica, alumina, and lime, the silica sometimes about 50 per cent of the whole; but with small and variable proportions of peroxide of iron, peroxide of manganese, potash, soda, and water. It is a widely diffused min-

eral, and although first discovered at the cape of Good Hope, has been found in great beauty in some places on the continent of Europe and in Scotland. Preamite exhibits a great variety of forms, with considerable variety of color; being found in crystals in fan-shaped and cockscomb-like groups, granular, reniform, fibrous, etc. It is colorless, or more generally greenish, and sometimes yellowish. See JADE.

PRELATE (Lat. *prælatus*, one set over), in church law, is the name given to the holders of those higher dignities in the church, to which, of their own right, is attached a proper jurisdiction, not derived by delegation from any superior official. In this sense, the name comprises not only prelates of the first class, as bishops, but also the heads of religious orders, abbots or priors of religious houses, and other similar ecclesiastical dignitaries. These, for the most part, are privileged to wear the insignia of the episcopal rank. In the Roman court, many of the officials, although not possessing episcopal or quasi-episcopal jurisdiction, have the insignia and the title of prelate. They are of two classes—the higher, called *del mantelletto* ("of the little mantle"), and the secondary, called *del mantellone* ("of the great mantle"), from the robe which they respectively bear.

PRELUDE (Lat. *præ*, before, and *ludo*, I play), in music, a short preface or introduction to a piece, intended to awaken the attention of the audience, generally smooth and flowing, and consisting of a short motive which is kept throughout; or it may be composed of a succession of harmonies uninterrupted or connected by passages. It is in the same key with the piece which it is to introduce, and to which it is intended as a preparation.

PREMISES is a common legal term to signify a house or building, and the out-houses and places belonging to it, all of which are treated as one thing. It is also used to denote a certain part of an English deed, which is further subdivided into the form, date, parties, recitals, testatum, and parcels. The use of the word in this sense is derived from the subject-matter of a conveyance or deed being first stated or described in full, and afterward referred to collectively as the premises (Lat., *premissa*, things spoken of or rehearsed before).

PREMISE. See SYLLOGISM.

PREMONSTRATENSIAN (called also **NORBERTINE ORDER**, a religious order, which at one time was among the most numerous and powerful of the monastic bodies of Germany, in which country its most important houses were established. It was founded in the early part of the 12th c. by St. Norbert, a native of Xanten, in the diocese of Cleves, of which church he was a canon. Struck by the prevailing irregularities and carelessness, not only of secular, but also of conventual life among the clergy and the monks, he resolved on attempting a reform of both, and obtained permission, in 1120, to found a cloister in the diocese of Laon, in France. The place selected by him was a spot in the forest of Coucy, pointed out, as he believed, in a vision, and thence called *Pré Montré*, or in Latin, *Pratum Monstratum*, "the indicated meadow," from which the name of the order was taken. In accordance with the double object which he sought to attain, Norbert organized his new order, which was substantially that of the canons regular of St. Augustine, as well with a view to the sanctification of the members, as to their usefulness in effecting the reformation of the age. Himself a man of remarkable piety and austerity of life, his rule is a return to the primitive fervor of the monastic institute; and the great work which he proposed for his brotherhood, in addition to the daily choral services of the church, was the practical instruction of the people, and the direction of consciences in the confessional. It was taken up with ardor, and spread rapidly in France and the Low Countries, and afterward—on Norbert's being chosen, in 1127, archbishop of Magdeburg—in Germany; the abbot of the mother-house at Coucy, however, retaining the rank of general and of superior of the entire order. It does not seem at any time to have made much progress, or at least to have established many houses, in Italy or Spain. In the same spirit of reformation, Norbert established an order of nuns, which attained to equal success. In the end of the 15th c., the Premonstratensian Order had no fewer than 1500 convents of men, and 500 of women, nearly all in France, Germany, and the northern kingdoms. A relaxation of the institute having taken place, in the progress of time there was a movement in the order, toward the close of the 16th c. (1573), similar to that which, in the Franciscan order (q. v.), led to the reform of the so-called conventual Franciscans; but the reformed communities in the Premonstratensian institute remained united with the older body; and in 1630 the reformed rule was accepted by all in common. The order, however, has gradually fallen in popularity. In France, its numbers had declined very much even before the revolution. Since that event, it may be said to have disappeared, except in Germany, where (in Austria) some magnificent, though thinly peopled houses of the order are still maintained.

PRENCE, THOMAS, 1601-73; b. England; came to Plymouth, Mass., in 1621 with the Leyden pilgrims, and settled at Eastham among the pioneers. He was governor 1634-38; re-elected 1657, serving till his death. His claim to the remembrance of posterity lies in his zeal for the religious and educational advancement of his fellow-colonists.

PRENTICE, GEORGE DENISON, 1802-70; b. Conn.; graduated at Brown university, 1823; studied law and was admitted to the bar in 1829, but did not practice. In 1830 he removed to Louisiana, having been editor of the *Hartford Weekly Review* for two years.

previous. From this time until his death he was the editor of the *Louisville Journal*, a whig newspaper, which throughout the war opposed the cause of secession with much vigor. He was a man of great personal courage, keen-witted, bitterly sarcastic, and of high political sagacity. He published many poems of some merit, a life of Henry Clay, 1831; and a collection of witty paragraps from his paper, *Prenticeana*. His biography has been written by Mr. G. W. Griffin.

PRENTISS, a co. in n.e. Mississippi, drained by the Big Hatchie and Tombigbee rivers, both of which rise here, traversed by the Mobile and Ohio railroad: 350 sq. m.; pop. '80, 12,158—12,141 of American birth, 2,421 colored. Surface level and swampy; the magnolia tulip tree and black walnut abound; cotton, corn, and pork are the chief products. Co. seat, Booneville.

PRENTISS, BENJAMIN MAYBERRY, b. Va., 1819; removed to Missouri and Illinois, and engaged in business. He was a capt. of vols. in the Mexican war, and in 1861 was made col. of the 7th Illinois vols.; shortly afterward brig.gen. of 3 months' men, and placed in command at Cairo. He was first in command at the battle of Mount Zion, and won a decisive victory. In 1862 he left Missouri and joined Grant just before the battle of Shiloh, at which he was taken prisoner. In 1862 he was made a maj.gen., and in 1863 defeated Holmes and Price at Helena, Ark.

PRENTISS, GEORGE LEWIS, D.D., b. Mass., 1816; graduated at Bowdoin college in 1835; was a teacher in the Gorham academy, 1836-37; studied theology at the universities of Halle and Berlin, 1839-41; became pastor of the South Trinitarian church (Congregational), New Bedford, Mass., in 1845, and of the Mercer street Presbyterian church in New York in 1851, which charge he resigned on account of ill health, and spent two years abroad. On his return he formed a new Presbyterian church on Murray Hill, New York (Church of the Covenant), and was installed its pastor in 1862. In 1873 he resigned this pastorate to accept the professorship of pastoral theology, church polity, and mission work in the Union theological seminary of New York. He has published *A Memoir of Sargant S. Prentiss*, 2 vols.; *A Discourse in Memory of Thomas Harvey Skinner, D.D.*, LL.D.

PRENTISS, SARGANT SMITH, 1808-50; b. Me.; graduated at Bowdoin college, and was admitted to the Mississippi bar in 1829; removed to Vicksburg in 1832, and represented it in the state legislature in 1835. Elected to congress in 1838, he made a strong speech against the sub-treasury bill, but otherwise took little part in the proceedings of the house. He strenuously opposed the repudiation of the Mississippi state debt, and in part from his dislike to that measure removed to New Orleans in 1845.

PRENZLAU, or PRENZLOW, a t. of Prussia, in the province of Brandenburg, stands on the northern shore of the lower lake Ucker, 71 m. n.e. of Berlin. It contains a mineral spring, several baths, and among its churches the beautiful Gothic *Marienkirche*, one of the most remarkable brick buildings in the country; date 1325-40. Pop. '75, 15,731, who carry on several manufactures, but are chiefly engaged in growing tobacco and corn, and in breeding and trading in cattle. Here, in Oct., 1806, a body of Prussian troops, 16,000 strong, under the prince of Hohenlohe, surrendered, after the defeat of Jena, to the French under Murat.

PREPOSITIONS are words that express certain relations between ideas—between the idea of an action and the idea of a thing, or between the idea of one thing and the idea of another thing. "The river runs to the sea. The glass stands on the table. The dog lies under the table. He runs round me. She runs from me. The house by the wood. The house in the wood." In all the instances just given, the relation is of one kind—that of place or direction. And this was the original signification of all prepositions, they gradually, however, came to express other relations. Thus: "That depends on you. Subjects are under the sovereign. She got round her father. Vice springs from idleness. Wood is consumed by fire. Your enemy is in your power." The transition from the palpable, physical relation to the more abstruse mental relation, is, in most cases, obvious.

A preposition is distinguished from an adverb by its always requiring an object (a noun or pronoun) after it. In the sentence, "He runs about," *about* is an adverb describing the mode of running; in "He runs about the house," it is a preposition referring the direction of the running to a particular object.

Many relations are expressed by *prepositional phrases*; as, *instead of*, *with regard to*, *apart from*. The preposition *beside* is evidently an abbreviation of such a phrase—*by the side of*. This tendency in phrases to become simple prepositions, is manifest in other cases. Instead of the full expression, "on this side of the river," we often hear, "this side the river," where *this-side* has the force of a preposition, and may yet come to be written *thisside*.

Of the relations expressed in the modern forms of the Aryan tongues by prepositions, a great many were formerly expressed by cases. See DECLENSION, INFLECTION, PHONOLOGY.

Along with prepositions are classed certain particles, which, although they may not stand by themselves and govern a case, are yet used in composition with verbs in the same way as the prepositions proper; as in *outrun*, *replace*.

The simple prepositions (Eng. *in*, Dan. *i*, Lat. *in*, Gr. *en*; Eng. *on*, Gr. and Goth. *ana*, Ger. *an*, Slav. *na*; Eng. *of*, Goth. *af*, O. H. Ger. *aba* or *apa*, Ger. *ab*; Sans. *apa*, Gr. *apo*, Lat. *a*, *ab*; Eng. *by* [*be*], Goth. *bi*, Ger. *bei*, Gr. *epi*, Sans. *abhi*; etc.) belong to the primary or radical words of language. They are often identical with the pronominal roots (see PRONOUNS), and along with them form a class of roots whose primary signification is position or relation in space. All attempts, like those of Tooke, to make them derivatives from verbs, are futile. On the contrary, verbs and other parts of speech are often derived from prepositions, as *utter* from *out*; *open* and *upper* from *up*. Some prepositions have a derivative form, as *after* (from the root of *of*), Lat. *inter* (*in*); others are compounded of two prepositions, or a preposition and prepositional particle, as *upon*, *but* (i. e., by out, or be out), *before*, *within*, *into*. Other prepositions, again, contain a noun, as *against* (A. S. *ongegen*, or *tō gegnes*; where, from the forms in the allied languages, the element *gegen* is clearly a substantive, the primary meaning of which, however, has not been made out); *among* (A. S. *gemang* or *ongemang*, *gemang* meaning primarily mixture); *between* (i. e., by or be, two or twain). Such prepositions as *during*, *except*, were originally participles used absolutely; thus, "during the war" = the war during or lasting, i. e., while the war dured or lasted; "except this" = this excepted (*hoc excepto*).

The study of the etymological relations of prepositions is instructive, as showing how near to one another often lie the most opposed meanings. They are, as it were, the opposite poles of one and the same conception—correlatives depending on a common ground relation, and are thus naturally expressed by words that are radically the same. Thus, Eng. *up* corresponds to Goth. *uf*, Sans. *upa*, Gr. *hypo*, Lat. *sub*. The meaning of *up* is motion from below to above, leaving, however, the idea of the upper terminus the more prominent; *uf*, *hypo*, *sub*, on the contrary, are used to express *under*; but that the notion of upward motion lurked in these roots, is clear from such Latin compounds as *suspicio*, to look up at a thing; *sustineo*, to hold up; and it only required a slight modification—a kind of comparison—to convert them into *ufur*, *hyper*, *super*, meaning "above"—a result which the English attains by adding the preposition *on* (upon). The same principle is copiously exemplified in the numerous forms and derivatives of the prepositional root FR, in Sans., Gr., Lat., and Sl., PR, in which motion or removal from the speaker in the front direction seems to be the ground idea. For example, when, in reference to any epoch, we speak of the events that have *preceded* and those that are *predicted* as to come, the same particle *pre* points in two opposite directions.

PREROGATIVE COURT, in England, was the court wherein all wills were proved and administrations taken out. It was so called because it belonged to the prerogative of the archbishop to take charge of these matters, which formerly fell under ecclesiastical superintendence. Hence there was a prerogative court for the province of Canterbury, and another for the province of York. This jurisdiction was entirely taken away in 1858 from the ecclesiastics, and transferred to a new court called the probate court (q. v.).

PRESBURG, a co. in n. w. Hungary, bounded by Neutra, Komorn, Wieselburg, and lower Austria; 1664 sq. m., pop. '70, 297,377. It is intersected by the Vienna, Presburg, and Pesth railway, connecting its capital with Vienna. It is drained by the Danube river navigable by steamboats; and is traversed by the Carpathian mountains. Near the city of Presburg is the island of Schutt in the Danube. Its soil is clayey and sandy in certain localities, and very fertile except in marshy sections and near the mountains, on which the snow lies as late as June, but where fruit is often raised, and an abundance and variety of wines are produced. Timber is plentiful, growing in forests of oak, beech, lime, birch, maple, and pine. The arable portions produce corn, wheat, tobacco, hemp, potatoes, and millet. Chestnuts, lemons, oranges, plums, and cherries grow. Live stock is raised, horses of a small growth, and cattle peculiar to the country, of a grayish-white color, with large spreading horns. Marble is the chief mineral product, and the mineral springs are celebrated for their medicinal virtues. The principal city next to the capital is Tynau, a manufacturing town with a considerable trade. Its leading industries are the manufacture of woollens, silks, tobacco, snuff, oil, rosoglio, and leather, and it has a considerable trade in corn, linen, and wine. Capital, Presburg.

PRESBURG (Lat. *Posonium*; Magyar, *Pozsony*; Slav. *Pressburek*), a t. in the extreme w. of Hungary, close upon the frontier of lower Austria, is built on the left or northern bank of the Danube, 41 m. by railway e. of Vienna. The neighboring hills are clothed with vineyards. It was long the principal city of Hungary, having been made the capital in 1541, when the Turks seized possession of Buda; and even as late as the last quarter of the 18th c. it was the most beautiful and the most populous town in the kingdom; but when Joseph II., in 1784, restored to Buda its ancient dignity of being the capital of Hungary, and the scene of the coronation of its kings, the sources of the prosperity of Presburg began to be dried up. Its population in 1869 was 46,544, of whom more than two-thirds were Roman Catholics, about 10,000 Lutherans, and 7,000 Jews. Fully one-half of the inhabitants are German, and German is the prevalent language. The most notable buildings in the town are the (Gothic) cathedral, in which the kings of Hungary were crowned; the royal palace, a vast square structure overlooking the town, accidentally burned in 1811, and not since repaired; the Capuchin, Franciscan,

and Ursuline monasteries, with beautiful churches attached to them; the land-haus (hall of the Hungarian diet), etc. The transit-trade by steamboat and railway, especially in corn, is very great, and gives considerable animation to an otherwise quiet place. Presburg carries on manufactures of silks, woolens, leather, paper, tobacco, glass, and chemical products. Outside the town lies the "king's hill" (*Königshügel*), to which the sovereigns of Hungary were wont to ride after their coronation, and brandish their sword toward the four quarters of the heavens, signifying by that symbolic act that they would defend Hungary from danger—come whence it might. A treaty was concluded here between Napoleon and the Austrian emperor—known as the "treaty of Presburg"—Dec. 27, 1805, in virtue of which Austria ceded Venice to France, and the Tyrol to Bavaria. Presburg gives name to a "county."

PRESBYTER, PRESBYTERIANISM. Presbyter (Gr. *presbyteros*, elder) is the title of an office or dignity in the Jewish synagogue, and also of one of the grades in the Christian hierarchy. In the latter sense the title has been the occasion of a protracted controversy as to the respective claims of the bishop (q.v.) and the presbyter, which, except historically, would be out of place in these pages. The word presbyter not unfrequently occurs in the Epistles and the Acts of the Apostles, and in more than one of these passages it is certainly applied to persons whose office would seem to be in all respects the same as that which is claimed for the "bishop" in the Episcopalian theory. From this identity of name the identity of office has been inferred, and it has been hence concluded that the distinction of bishops and presbyters is a human and post-apostolic ordinance. Advocates of the Episcopal theory admit that the name presbyter is occasionally given, both in Scripture and in the early church writers, to persons who bore the office of bishop (*episcopos*), and that the latter certainly was in all cases a presbyter; but they contend that besides being a presbyter, he was also something more and something higher. That the office of Timothy, for example, was superior to that of a presbyter is conceived to be plain from St. Paul's instruction to him (1st Timothy v. 19) as to how he should receive testimony against a presbyter. The same is inferred from Titus i. 5. On the other hand no example, it is affirmed, appears of a presbyter sitting in judgment on a bishop, or "appointing bishops in every city." But Presbyterians do not admit the validity of these arguments, inasmuch as they assert the identity of presbyter and bishop, and the right of co-presbyters both to judge a brother and also to ordain the office of the ministry. Episcopalians rely still more, however, on the apostolic fathers, and those of the 3d and 4th centuries. Among the fathers of the former period, Clement of Rome, and even more plainly, Ignatius of Antioch, point to the bishop's superiority as already established, and they are followed by Tertullian, Ireneus, Clement of Alexandria, and Cyprian. On the Presbyterian side a remarkable passage is quoted from Jerome, in which, while repressing the pretensions of deacons to equality with presbyters, he appears to place the presbyter on the same level with the bishop in all the functions of the ministry except the power of ordination. The explanation of this passage, according to the Episcopalian view, is found in what has been already indicated by the community of name which existed even in the primitive times; while they also rely on the difference implied in the very important exception which even Jerome admits, in this very passage—viz., the power of ordaining. The offices of presbyter and bishop, according to the Roman Catholic theory, both, although in different degrees, belong to what Roman Catholics regard as the priesthood of the new law. This priesthood the bishops possess in its fullness, the presbyter only in part, but the functions which belong to that part are discharged alike by the presbyter and the bishop, although by the former only in subordination to the latter. What these functions are will be detailed under the head priest (q.v.); but the principle of a certain distinction of functions, and the limitation of the power of the presbyter as to one at least—that of ordination—is expressly recognized by Jerome in the passage alluded to. The name presbyter has been retained even in the Roman Catholic theory of a priesthood; but although, by the opponents of the Episcopalian doctrine, the word is used with the express design of excluding the sacerdotal idea, it has come, in the popular language of Roman Catholic theology, to be identical with priest. From an early period, however, a distinction of rank among the presbyters came into use. Several being, in some cases, attached to a single church, one of the number received the title of *proto-presbyter* or *archi-presbyter*; but it is quite certain this office bore no analogy to that of the bishop.

In all existing Presbyterian churches a primary element is the representation of congregations in presbyteries, etc., by their delegated elders, of whom the "minister," or preaching elder, is always one; and this system of representation is advocated partly on the general ground of the unity of the church, and partly on the special ground of the example of the church in the apostolic age (Acts xv.). The affairs of particular congregations are managed by a court, styled in Scotland the kirk-session, consisting of the minister, or ministers, if there are more than one, and the other elders, the minister or one of the ministers presiding, but each member having equal power and vote. From the decisions of this court an appeal lies to the presbytery, which is usually constituted of the ministers of a certain number of his congregations and one "ruling elder" from each congregation. Further appeals may be taken to *synods* and *general assemblies*, in churches so large that for convenience the presbyteries of a district are grouped into a "provincial

synod," and all the provincial synods are subordinated to a general assembly; but in respect of this, there are considerable diversities, and the "supreme" church court, whether *synod* or *general assembly*, is variously constituted by direct representation of each congregation, of each presbytery, or of each provincial synod. Nor are diversities of this kind regarded as in the least degree affecting the principle of Presbyterianism.

Presbyterian churches generally recognize an order of *deacons* (q. v.) as existing in the church, with power only over its secular affairs; but in many Presbyterian churches this office is merged in that of the elder, and all its functions are exercised by the members of the kirk-session. A tendency to revive the distinct office of deacon, has, however, been recently manifested in some of the Presbyterian churches.

Some Presbyterians maintain the *divine right of presbytery*, as the one system of church government authorized by the word of God; others only maintain that Presbyterianism is *consistent* with the word of God; whilst many Presbyterians maintain that the Presbyterian system, whatever its imperfections as existing anywhere, is, of all systems that have ever existed in the church, the most agreeable to the principles of church government which may be deduced from Scripture.

Presbyterianism, variously modified, is the form of church government subsisting in many Protestant churches, but is more perfectly developed in Britain and America. In Britain it prevails chiefly in Scotland, although on the revolution in the 17th c. it was for a very short time in the ascendant in England also. The *consistorial* system of the continent of Europe (see *CONSISTORY*), cannot, in any of its modifications, be regarded as essentially Presbyterian, although in some respects it approaches to Presbyterianism. The French consistorial system is more nearly Presbyterian than the German, and is not perfectly so only from the pressure of the civil power. In other churches, also, as well as in the Protestant church of France, Presbyterianism is more or less modified by the relations of the church to the state.

PRESBYTERIAN CHURCH IN UNITED STATES. The first Presbyterians in America were emigrants from Scotland and Ireland. The first Presbyterian congregations in America were organized in Maryland before the close of the 17th c.—the oldest, that of Rehoboth, dating about 1690; and the first presbytery in Philadelphia in 1705. A synod, consisting of four presbyteries, was constituted in 1716. Dissensions ensued; but in 1758 the American Presbyterian churches were united in one; and in 1788 a general assembly was instituted, the whole number of congregations being then 419, and of ministers 188. The increase of the church was rapid, and in 1834 it contained 22 synods, 111 presbyteries, and about 1900 ministers. In 1801 a scheme of union was adopted between Presbyterians and Congregationalists, under which hundreds of congregations were formed in the state of New York and elsewhere. About the beginning of the present century the Cumberland Presbyterians (q. v.) separated from the main body; and in 1838 the American Presbyterian church was divided into two great sections, commonly known as *old school* and *new school* Presbyterians; the former holding high Calvinistic doctrines; the latter, a somewhat modified Calvinism. Both of these churches are extended over the whole of the United States, and both of them have missions in different parts of the heathen world, their collections for missions forming a large part of the contributions for that object from the United States of America. For some years they showed symptoms of a sincere desire to reunite; and this object they accomplished in 1869, notwithstanding the dissensions and new divisions caused by the struggles between the northern and southern states on the question of slavery. At the time of this union the old school Presbyterians counted 2,381 ministers, 2,740 churches, and 258,903 communicants; while the new school numbered 1848 ministers, 1631 churches, and 17,562 communicants. The former possessed at the same time the following theological seminaries: "Princeton," "the Western," "Union," "Danville," and "Chicago;" and the latter owned the "Union," "Auburn," "Lane," "Blackburn," and "Lind." Besides the Cumberland Presbyterians there are other minor branches of the Presbyterian church in America, connected with different denominations in Scotland.

PRESBYTERIAN CHURCH IN THE UNITED STATES (*ante*) was founded by Scotch, Irish, Huguenot, Dutch, and German reformed emigrants with a few from New England. Persecution in Europe forced many to seek new homes in the colonies of Maryland, New Jersey, Pennsylvania, Virginia, and Carolina. One of the first Presbyterian ministers was Francis Makemie, from Ireland, and the earliest churches planted by him were at Rehoboth, on the eastern shore of Maryland and other places in the same colony. Other churches founded at nearly the same time were the "Scotch meeting-house at Freehold, N. J., 1692; the first Presbyterian church at Philadelphia, 1698; and Drawyer's church, Delaware, before 1700. The presbytery of Philadelphia was organized a little later than 1700; the precise date having been written only on the first page of the records, which has been lost. It consisted of seven ministers—Samuel Davis, John Hampton, Francis Makemie, and George McNish, from Ireland; Nathaniel Taylor and John Wilson from Scotland; and Jedediah Andrews from New England. In 1716 the synod of Philadelphia was formed, consisting of four presbyteries: Philadelphia, with six ministers and churches; New Castle, six ministers and churches; Snow Hill, three ministers and churches; and Long Island, two ministers and churches. The act by which the Westminster confession and catechisms were adopted as the standards of

the church was passed in 1729, after much excited discussion between the recently arrived Irish ministers and those who had been in this country a longer time. The former desired the very words of the Westminster standards; the others were displeased with even the general terms of the adopting act, which was intended for a compromise, but did not fully accomplish its design. The differences of opinion continued to manifest themselves, and at length resulted in an American branch of the associate Presbyterian church. In 1739 the visit of Whitefield and the revivals attending his work, aroused a new party feeling in the church, dividing the synod into the warm friends of the revivals and those who were opposed to, at least, some aspects of the work. In 1741 the synod was rent in twain: the old side, who insisted on a thoroughly educated ministry, remained in the synod of Philadelphia; and the new side, who attached chief importance to piety and zeal, constituted the synod of New York. There was little difference between the two bodies as to either doctrine or discipline. Gilbert Tennant, the warm friend of Whitefield, was the leader of the new side. After 13 years the breach was healed, the two-synods uniting in 1758, under the name of the synod of New York and Philadelphia. At this time population was flowing rapidly to the west, having on its frontier line persons of very diverse characters and aims. Some were lawless men, seeking opportunity to live as they pleased, some loved the excitement of frontier life; some sought chiefly to improve their temporal condition by obtaining cheap homes on new lands. All were poor; they were exposed to hostile Indians; and to these obstacles the Presbyterian evangelist in some regions found state opposition superadded. Only men of education, energy, and zeal could have overcome such hindrances. Such were many of the first Presbyterian ministers: the Tennants of New Jersey; David and John Brainerd of the Indian mission, and Davies of Virginia.

In 1763 the synod agreed to meet in annual convention with the general association (Congregational) of Connecticut, to unite their endeavors and counsels for spreading the gospel and preserving the religious liberties of the churches. This plan was adhered to until the revolution suspended all intercourse. At the revolution the Presbyterians were united and zealous patriots, and in common with others suffered greatly. Many of their church buildings were destroyed; others were occupied as hospitals and barracks; and many of their congregations were disbanded. Yet the vitality of the church continued, and on the return of peace increased interest was manifested in all religious affairs. In 1785 a large committee of eminent men was appointed to form from the constitution of the Scottish and other Protestant churches a system for the Presbyterian church in the United States. In May, 1788, the synod resolved itself into a general assembly, the first meeting of which was held the following year. It embraced four synods: New York and New Jersey, Philadelphia, Virginia, and the Carolinas. These contained 17 presbyteries, 419 congregations, and 186 ministers. The assembly adopted the Westminster confession of faith with a few slight alterations; the catechisms, with one alteration; and modified the form of government and discipline of the church of Scotland so as to disclaim the right of the civil magistrate to interfere in church affairs except for protection alone. After the war the friendly relations with Congregationalists were at once renewed. In 1792 the general assembly and the general association of Connecticut agreed that each denomination should be represented in the annual meeting of the other by three commissioners; and the agreement was afterward extended to the general associations of Massachusetts, New Hampshire, and Vermont. In 1794 these commissioners were allowed to vote on all matters under discussion. In 1801 a plan of union was adopted by both denominations under which a Congregational church might have a Presbyterian pastor, still retaining his place in his presbytery, and might be represented therein by its delegate instead of a ruling elder; and a Presbyterian church represented in its presbytery by a ruling elder might have a Congregational pastor still continuing a member of his association. By the operation of this "plan of union," during 26 years hundreds of Congregational churches became Presbyterian, modified by sending a "committee-man" to the presbytery; and in many cases the committee-men grew naturally into genuine and excellent ruling elders.

At the opening of the present century the revivals that prevailed in various sections of the church were of special interest in the s. w., having in many cases singular physical accompaniments—and led incidentally, in 1811, to the formation of the presbytery of Cumberland. See CUMBERLAND PRESBYTERIANS. In 1822 the synod of the associate Reformed church, under the lead of Dr. John M. Mason, united with the Presbyterian church; a considerable minority, however, refusing to acquiesce in the vote of the majority, retained their separate organization. During the following years the denomination increased very rapidly. New churches and presbyteries were multiplied in the middle and western states. In 1834 there were 22 synods, 111 presbyteries, and about 1900 ministers. In 1837-38 the division of the church into the old-school and new-school branches occurred. See NEW-SCHOOL and OLD SCHOOL PRESBYTERIANS. It continued until Nov., 1869, when terms of re-union, entirely equal and fraternal, were mutually adopted, and declared to be of binding force, at an adjourned meeting of both general assemblies, at Pittsburg, Penn. In 1870 the first reunited general assembly, composed of commissioners chosen by all the presbyteries of both branches, met in Philadelphia, and reconstructed the church by consolidating the 51 synods into 23, and directing them to meet at specified times and places in order to reconstruct the presby

teries within their bounds. These meetings were duly held, and the 259 presbyteries consolidated into 167.

The administration of the benevolent work of the reunited church was intrusted to the boards of foreign missions, home missions, and church erection, to be located in New York city; the boards of publication, ministerial relief, and education, in Philadelphia; the committee on freedmen, to which was added in 1871 the committee on sustentation, at Pittsburg, Penn. The theological seminaries were brought under one general plan, according to which, while their boards of directors have the general charge of them, including the election of professors, they report annually to the general assembly, which has a veto power on professors newly elected, to be exercised, if at all, immediately after the election has been reported. Arrangements were commenced for celebrating the reunion by a general memorial fund, to be appropriated to any objects tending to establish the churches and extend their work at home and abroad. The amount thus contributed, as reported at the general assembly of 1871, was about \$10,000,000 additional to the regular contributions to the boards.

For the commencement and progress of the foreign missionary work of the Presbyterian church see FOREIGN MISSIONS. Its home missionary work began with its own existence. In 1707 the first presbytery resolved that every minister of the presbytery supply neighboring destitute places, where a minister is wanted, and opportunity of doing good offers. As the presbyteries and synods increased they greatly extended the work. In 1802 the assembly appointed a standing committee of missions to which the presbyteries were to report; in 1816 this committee was enlarged into a board having full power to transact all the business of the missionary cause, and to report annually to the assembly. From 1802-16 over 300 domestic missionaries were sent out, at a cost of \$50,000; from 1816-38, 2,500 were sent out, at a cost of \$230,000; from 1838-70, the old school branch alone sent out 16,000, at a cost of \$2,800,000. Before the division, and for some time after it, the new-school branch carried on its home-mission work through the American home missionary society. In 1852 their assembly appointed a church-extension committee, and, in 1862, gave their whole work of home missions to the charge of the Presbyterian committee on home missions. From 1838-69 it is estimated that they sent out 8,800 home missionaries. After the reunion both agencies were united into one board.

The American Presbyterian church has from the beginning diligently prosecuted the work of education. In 1739 a school was established by the synod of Philadelphia. In 1747 the college of New Jersey was established by influential men in the synod of New York. Among the numerous colleges and universities since founded by Presbyterians are: Washington and Jefferson, 1802; Hamilton, 1815; Maryville, Tenn., 1819; Centre, Ky., 1823; Hanover, Ind., 1827; Lafayette, 1831; Wabash, 1832; Lincoln, Penn., 1853; University, Cal., 1859; Blackburn, Ill., 1867; King, Tenn., 1857; Wooster, Ohio, 1870; Evans, Col., 1874; Parsons, Iowa, 1875. The theological seminaries are: Princeton, N. J., 1812; Auburn, N. Y., 1820; Western, at Allegheny, Penn., 1837; Lane, Ohio, 1832; Union, New York, 1836; Danville, Ky., 1853; Northwest, Chicago, Ill., 1859; Blackburn, Ill., 1867; San Francisco, Cal., 1871; German, Bloomfield, N. J., 1869; German, Dubuque, Iowa; Lincoln university (theological department); and Biddle memorial institute, Charlotte, N. C. (theological department). According to the reports made to the assembly, 1880, there are in connection with this branch of the church: 38 synods, 177 presbyteries, 5,338 ministers and licentiates, 5,489 churches, 578,671 communicants, 631,952 members of Sunday-schools, and the total amount of contributions in the preceding year was \$8,361,028.

PRESBYTERIAN CHURCH OF THE UNITED STATES (SOUTH), organized, Dec. 4, 1861, by commissioners from all the presbyteries within what were then called the Confederate states, who met at Augusta, Ga., and constituted the general assembly. The title chosen was the Presbyterian church of the Confederate States of America; but after the suppression of the rebellion, *United* was substituted for *Confederate*, and of *America* was dropped. At that time this church contained 12 synods, 62 presbyteries, 1821 churches, 1079 ministers, and 112,183 communicants. Its contributions amounted to \$1,138,681. Its standards, substantially the same as before its separate organization, have been amended in some minor particulars to suit the circumstances and views of southern Presbyterians. It claims to be even stricter than before in its views concerning the standards and the divine authority of church government; and more zealous than ever in maintaining special and protracted religious services. Southern Presbyterians have always held a high standard of ministerial and general education. They have been prominent in the work of founding and maintaining colleges and schools. During the war many of these institutions perished by the loss of their endowments in the general wreck. Among these were Oglethorpe university, Ga., Oakland college, Miss., La Grange college, Tenn., and others less prominent. Some were suspended by the enlistment of their students in the armies, and some suffered a partial loss of endowments. Many, having survived the disasters of the war, are now growing in strength and usefulness. Among this class are: Hampden-Sidney, Va., Davidson college, N. C., Westminster college, Mo., King college, Tenn., and Austin college, Texas. Central university, Richmond, Ky., has been founded since the war. Six of the synods have together projected the South-

western university, to be located at Clarksville, Tenn., for which they are now gathering an endowment. Many academies of established character were, like the colleges, broken up by the war. Some however remain; among them are: Bingham school, Mebanesville, N. C., Pleasant Ridge academy, Ala., Edgar institute, Paris, Ky., military and classical institute, Danville, Ky., Finlay high school, Lenoir, N. C., and Kemper institute, Booneville, Mo. There are 2 theological seminaries—Union, at Hampden-Sidney, Va., and Columbia, at Columbia, S. C.—these are endowed and furnished with buildings, libraries, and 4 professors each. The benevolent operations of the church are conducted by the general assembly through the executive committee of foreign missions and sustentation, of publication, and of education.

Foreign missions have been established in the Indian territory, Mexico, South America, Greece, Italy, India, and China. At the date of last report, number of missionaries: 26 ordained ministers, 25 licentiates and assistant missionaries from the United States, with 9 ordained native ministers, and 25 native assistant missionaries, making altogether 85. These missions have under their care 22 churches, containing 1200 members, and 13 schools containing 250 pupils. The sustentation branch of the committee distributed \$20,000 to aid in the support of 185 churches in 57 presbyteries, \$6,000 for evangelistic labor, and \$10,000 to relieve disabled ministers and the families of ministers deceased. A house is established at Richmond, Va., with a capital of \$40,000 for publishing books for the libraries of ministers, congregations, and Sunday-schools.

The *Southern Presbyterian Review*, established more than 30 years ago, and now published under the supervision of the professors in the two theological seminaries, is conducted with learning and ability. Considering the calamities which have fallen on this portion of the Presbyterian church since its organization, its success has been remarkable; but considering the vast extent of territory over which it is diffused, and the destitution of a large part of it, the work yet to be done is very great, and the means for doing it very small. According to the reports made to the assembly, 1879, there were in connection with this branch of the church: 12 synods, 66 presbyteries, 1122 ministers and licentiates, 1892 churches, 116,755 communicants, 70,224 children in Sunday-schools, and the total amount of contributions was \$1,015,851.

PRESBYTERIAN CHURCH IN ENGLAND. The principles of the Puritans (q. v.) were essentially Presbyterian, although many of them were so much occupied with questions of doctrine and discipline, and with resistance to power exercised, as they believed, contrary to the word of God, that they paid little heed to the development of their principles in church government. Yet, in 1572, a presbytery was formed at Wandsworth, in Surrey, by ministers of London and its neighborhood, separating from the church of England; and other presbyteries were soon formed, notwithstanding the extreme hostility of queen Elizabeth. When the Westminster assembly met in 1643, the Puritans of England were generally inclined to adopt Presbyterianism as their system of church government, although some still preferred a modified episcopacy, and some had adopted the principles of independency or Congregationalism. The Presbyterians were, however, the strongest party in the beginning of the revolution, although the Independents gained the ascendancy afterward. The establishment of Presbyterian church government in the church of England was voted by parliament (the long parliament), Oct. 13, 1647; but it was never really established. The influence of the Independents prevented it. London and its neighborhood were, meanwhile, formed into 12 presbyteries, constituting the provincial synod of London, which continued to hold regular half-yearly meetings till 1655, the meetings of presbyteries being continued till a later date; but the whole Presbyterian system was overturned by Cromwell's committee of triers, appointed for the examining and approving of all persons elected or nominated to any ecclesiastical office. Cromwell's policy aimed at bringing all ecclesiastical matters under the immediate control of the civil power. The restoration was followed by the fruitless Savoy conference (q. v.), and soon after by the act of uniformity, which came into force on Aug. 24, 1662; and on that day, about 2,000 ministers in England and Wales resigned their benefices, or submitted to be ejected from them, for conscience' sake. The first Nonconformists (q. v.) were mostly Presbyterians, but a small minority of Independents among them prevented the institution of a regular Presbyterian system, and the consequence was that the Nonconformists of England became in general practically independent. Antinomianism and Arminianism soon appeared among them, and were followed by Socinianism or Unitarianism to such an extent, that the name *Presbyterian* became synonymous in England with *Socinian* or *Unitarian*; old endowments, legacies of Presbyterians, being in many instances enjoyed by Unitarians. Meanwhile, there existed in England a few congregations connected with the church of Scotland, and with what was formerly known as the "Secession church," now the United Presbyterian church. The number of such afterward very much increased. At the time of the formation of the Free church of Scotland (q. v.), the greater number of the English Presbyterian churches connected with the church of Scotland sympathized with the cause of the Free church, and took the name of the Presbyterian church in England. In 1876 a union, which had been long desired, was consummated between the synod more intimately related to the Free church of Scotland and the congregations belonging to the United Presbyterian church. The name assumed by the united church is the Presbyterian church of England. At the time of the union, the Presbyterian church in England had about 150 churches, and the United

Presbyterian church more than 100. At the same date, the church of Scotland in England had about 20 congregations.

PRESBYTERIAN CHURCH IN IRELAND. The Irish Presbyterian church originated in the settlement of Ulster by Scottish colonists during the reign of James I. After various struggles, a Presbyterian church was founded by the formation of a presbytery at Carrickfergus in 1642. The Presbyterian population of Ulster was greatly increased in number by immigration from Scotland about the middle of the 17th c.; and notwithstanding many difficulties, from the opposition of prelates and of the civil power, the church continued to increase. It is a curious fact that the Presbyterian ministers received a pension from government, under Charles II., in 1672, which *regium donum* (q.v.), however, was not regularly paid until the reign of William, when it was augmented, although only to the paltry amount in all of £1200 a year. It was afterward repeatedly augmented, till it reached the amount of £70 for each minister. A seminary for the education of ministers was erected at Killaleagh; and in 1710, the synod of the Presbyterian church resolved to institute the preaching of the gospel to the Irish in their own language. During this period of its history, the Irish Presbyterian church, experienced the utmost opposition from the *high church* party. Afterward, dissensions sprung up within it, and these with reference to the most important doctrines. A body opposed to the doctrine of the Westminster confession of faith was organized as the presbytery of Antrim. But the doctrine of the Westminster confession was more and more departed from in the Irish Presbyterian church itself, which became to a large extent Arian or Unitarian. In 1830, a separation took place from the Arians, who then formed the *remonstrant synod of Ulster*. In 1840, a union took place of the Irish Presbyterian church forming the *synod of Ulster*, and the *secession church in Ireland*, an offshoot of the Scottish Secession church, which then reckoned 141 congregations in the n. of Ireland. The Irish Presbyterian church now consists of about 600 congregations, and has not only displayed much zeal for the advancement of Protestantism in Ireland, but also of Christianity in other parts of the world, and supports a very successful mission in Guzerat. The act disestablishing the Irish church in 1869, provided also for the discontinuance of the *regium donum* to the Presbyterians, with reservation of annuities for life to ministers already entitled to it; and further gave power for commutation of annuities for a capital sum, of which advantage has been taken to a very large extent, so that a fund has been formed for paying annuities and leaving a large surplus as the nucleus of a sustentation fund for the ministers in time to come. The liberality of the members of the church has at the same time been called forth to a greater degree than before.

PRESBYTERY, the space in the choir of a church in which the high altar is placed; the name is sometimes extended to the whole choir.

PRESBYTERY, in Scotch law, is an ecclesiastical division of the country, as well as a court. In its local sense, it includes a combination of parishes, varying from 4 to 30, and the general assembly of the church of Scotland has power to vary the size. See SCOTLAND, CHURCH OF.

PRESCOT, a manufacturing and market t. of Lancashire, 8 m. e. of Liverpool. At Huyton, $1\frac{1}{2}$ m. distant, there is a station on the London and North-western railway. Prescot has long been well-known for its manufactures of watch-tools, watch-movements, small files, etc. Potteries are in operation in the vicinity. The pop. in '71 was 5,990.

PRESCOTT, a co. in n.e. Ontario, having the Ottan river for n. and n.w. boundary separating it from Quebec; 500 sq.m.; pop. '71, 17,647. It is drained in the w. portion by the Petite Nation river. Russell co. holds its courts at the same court-house in its co. seat, L'Original.

PRESCOTT, a t. in e. Canada, division of Ontario, a port of entry on the n. bank of the river St. Lawrence; pop. '71, 2,617. It is connected with Ogdensburg, across the river by a ferry. It is on the Grand Trunk railway, at the terminus of the St. Lawrence and Ottawa railroad, connecting it with the city of Ottawa; 114 m. from Montreal, 220 m. from Toronto, and 47 from Ottawa. In the vicinity is the British fort of Wellington. It has a branch bank, 4 churches, and a weekly newspaper. Its manufactories consist principally of iron foundries, breweries, distilleries, and railroad repair shops, and it has a brisk local trade.

PRESCOTT, OLIVER, 1731-1804; b. Mass.; graduated at Harvard college in 1750; practiced medicine at Groton; was before the revolution maj., lieut.col., and col., in the militia, and in 1776 appointed brig.gen. for the co. of Middlesex, and was a member of the board of war; in 1777 was elected a member of the supreme executive council of state, serving three years; in 1779 was made judge of probate for the county of Middlesex; was surgeon of the expedition against Shav's rebellion. In 1780 he was elected a member of the academy of arts and sciences. He published a *Dissertation on the Natural History and Medical Effects of the Secale Cornutum or Argot*, and contributed to the *New England Journal of Medicine and Surgery*.

PRESCOTT, RICHARD, 1725-88; b. England; served in Germany during the seven years' war. He was in Canada in 1773, and surrendered Nov. 17, 1775, on the reduction of Montreal by the Americans; having been attacked while attempting to convey troops

and stores to Quebec. In the following September he was exchanged for gen. Sullivan. He was commandant at Newport, until captured by lieut. col. Barton; and on being exchanged for gen. Lee, resumed command in Rhode Island; remaining in that position until the evacuation of Newport, Oct. 25, 1779. In 1777 he was made maj. gen. and lieut. gen. Nov. 26, 1782.

PRESCOTT, ROBERT, 1725-1816; b. Lancashire, Eng.; was made capt. 15th foot, Jan. 22, 1755, accompanying them against Rochefort 1757 and Louisburg 1758. He acted as aid-de-camp to Amherst in 1759, and afterward served under Wolfe. He participated in all engagements in the revolution from the battle of Brooklyn, through those in Westchester co., to the storming of fort Washington, and the expedition against Philadelphia in 1777. He was brevetted col. Aug. 29, and fought in the battle of Brandywine. He went in the expedition against the West Indies under gen. Grant in 1778. He was made lieut. gen. 1793; was made gov. of Barbadoes and Guadeloupe after the capitulation of Mar. 22, 1794; and in 1796 became gov. of Lower Canada. Gen. in the army Jan. 1, 1798.

PRESCOTT, WILLIAM, 1726-95; b. Mass.; served in 1755 as lieut. and capt. in the provincial army under Winslow in an expedition against Nova Scotia. Afterward he became a farmer in Pepperell on a large estate which he had inherited. Hearing of the battle of Lexington, he formed a regiment of minute men, and marched as its col. to Cambridge. With a brigade of 1000 men he threw up intrenchments at Bunker hill, displaying great bravery, and being the last to leave the field. He served two years longer, and was a volunteer at Saratoga in 1777. Returning home he was in the state legislature for several years.

PRESCOTT, WILLIAM, 1762-1844; graduated at Harvard college in 1783; studied law at Beverly with Nathan Dane, and practiced there two years; removed to Salem in 1789; represented the town several years in the legislature, and afterward was elected by the federal party state senator; removed to Boston in 1808, and for several years was a member of the governor's council. In 1814 he was a delegate to the Hartford convention; in 1818 appointed judge of the court of common pleas; in 1820 was a delegate to the state constitutional convention. He was a member of the American academy of arts and sciences.

PRESCOTT, WILLIAM HICKLING, LL.D., American historian, son of a distinguished lawyer and statesman, and grandson of col. William Prescott, an officer of the revolution, was b. at Salem, Mass., on May 4, 1796. He entered Harvard college in 1811, and graduated in 1814. During his college course, he had one eye blinded by a piece of bread playfully thrown by a fellow-student, and his studies so affected the other that he was sent abroad for his health, and traveled in England, France, and Italy. On his return to America he married, and abandoned the study of law for literature. In 1819, he determined to devote 10 years to study, and the succeeding 10 to composition. He contributed, however, several papers to the *North American Review*, collected in his *Miscellanies*. In 1825 he was engaged in the study of Spanish literature, and selected materials for his *History of Ferdinand and Isabella*. While engaged in this work, his sight failed, and with the aid of a reader who knew no Spanish, he went through the seven quarto volumes of Mariana's history. After 10 years of painful labor his work was made ready for the press, and a few copies struck off for his friends, whose warm approval secured its publication in 1837 (3 vols. 8vo. Boston and London). It met with immediate success, and was translated into French, Spanish, and German. He next devoted six years to the *History of the Conquest of Mexico* (3 vols., 1843, London and New York); and four years to the *Conquest of Peru* (2 vols., 1847). These careful, elaborate, and charmingly written works made for him a high reputation. He was chosen corresponding member of the French institute; and, on his visit to Europe in 1850, he was received with the highest distinction. In 1855, he published two volumes of his *History of Philip II.*, and a third volume in 1858, but left it unfinished. He died at Boston, Jan. 28, 1859. Mr. Prescott was an elegant scholar and writer, a man of a cheerful humor and affectionate character, methodical in his habits, and persevering in his pursuits. He walked five m. regularly every day, composing as he walked. He devoted five hours to literary labor, two hours to novel-reading, for the refreshment of his mind—Scott, Dickens, Dumas, and Sue being his favorite authors. He gave one-tenth of his ample income in charity, and divided his time between his winter mansion in Boston, a summer residence at Nahant, and a farm-house where he spent the autumn. In his large library, with the light carefully regulated for his imperfect vision, he wrote with a stylus each day what he had composed, which was then copied, read over, and carefully corrected. His life, by George Ticknor, was published in 1864.

PRESCRIPTION is the term applied to the written direction or receipt given by the physician or surgeon to the chemist for the preparation of a medicinal substance suitable to a special case. In prescribing, the medical practitioner may either order an *officinal* or an *extemporaneous* compound. Official compounds (or preparations, as they are frequently termed) are those for which formulæ are introduced into the national pharmacopœias, and are therefore supposed to be always at hand in the laboratory of the dispensing chemist (such, for example, as *mistura ferri composita*, *pulvis ipecacuanhæ*

compositus, confectio aromatica, etc.); while extemporaneous compounds are those which are devised on the instant with the view of meeting the various peculiarities which almost every case of disease presents. "Too much importance," as Dr. Paris very truly observes, "cannot be assigned to the art that thus enables the physician to adapt and graduate a powerful remedy to each particular case by a prompt and accurate prescription. If he prescribes upon truly scientific principles, he will rarely, in the course of his practice, compose two formulæ that shall in every respect be perfectly similar, for the plain reason, that he will never meet with two cases exactly alike."—*Pharmacologia*, 9th ed., 1843, p. 374.

The author whom we have just quoted, and who is the highest English authority on the subject, lays down *five objects* which the physician should have in view in the construction of an extemporaneous formula or prescription. They are: 1. To promote the action of the principal medicine (or, as he terms it, the basis) of a formula. 2. To correct the operation of the basis. 3. To obtain the joint operation of two or more medicines which act in totally different ways. 4. To obtain a new and active remedy not afforded by any single substance. 5. To select an eligible form.

The *first object* may be attained (*a*) by combining different preparations of the same substance, as, for example, tincture of senna with infusion of senna in the ordinary black draught; or (*b*) by combining different substances of a similar action, as, for example, opium with hyoscyamus or conium; or sulphate of magnesia with the preparations of senna; or quinine with the preparations of iron. The *second object* may be attained in various ways. For example, the addition of extract of hyoscyamus to the compound extract of colocynth renders the purgative action of the latter much less griping, but not less efficacious; the addition of dilute sulphuric acid to a solution of sulphate of magnesia renders that purgative salt less liable to gripe, and makes it sit easier on the stomach; and extract of eleterium, if given in hot brandy and water, acts equally powerfully as a hydragogue cathartic without causing the depression of the vital powers, which it often occasions if given alone. As an illustration of a mode of attaining the *third object*, we may refer to the operation of purgatives and of diuretics. If we administer a purgative which acts mainly in increasing the peristaltic motion of the intestines, their contents will be urged forward and evacuated, but the operation will be slow and difficult, and probably be accompanied with griping; but if we combine this medicine with one which acts by increasing the flow of fluids into the intestine, the purgative action will be increased and quickened, and all griping will be avoided. A combination of foxglove, squill, and blue pill or calomel will act much more powerfully as a diuretic than any one of the substances taken alone; and they probably all act in different ways on the system. The *fourth object* is usually attained by chemical decomposition. The activity of the *Mistura Ferri Composita* is due to the carbonate of iron which it contains, and which is yielded by the double decomposition of the two ingredients of the mixture, sulphate of iron and carbonate of potash. By prescribing a mixture of solution of iodide of potassium and corrosive sublimate, we obtain an extemporaneous formation of biniodide of mercury. The black wash (see LINIMENTS) owes its active ingredient to the decomposition of calomel by lime-water. In some cases, where no chemical action is apparent or probable, a mixture of two or more drugs seems to modify the physiological effect of each ingredient. For example, Dover's powder contains as its active ingredients ipecacuanha and opium, and yet in well-regulated doses it neither exhibits the nauseating properties of the former nor the narcotic influence of the latter substance. The *fifth object*, the selection of the most eligible form of the remedy, is of extreme importance. The physician here has to determine whether he shall prescribe his remedy in the form of pill, powder, or mixture; whether he shall administer it as an injection into the lower bowel; whether the patient shall (in certain cases) inhale it; etc. As a general rule, we should accommodate the form and flavor of our remedies, provided we do not sacrifice their virtues to the taste of the patient, who usually prefers pills to draughts or powders. The unpleasant taste of many medicines which must be given in the fluid form may often be obviated by the skill of the prescriber. Castor oil, cod-liver oil, and copaiba are most easily taken on the surface of orange wine, or water containing a bitter tincture, care being taken to moisten with water the edge or rim of the glass at the part applied to the mouth. The taste of solution of potash and of lime-water is best covered with milk; and the disagreeable flavor of senna is said to be concealed if its infusion is made with strong tea.

In conclusion it may be remarked that in this country it is the custom to write prescriptions in the Latin language, to abbreviate well-known words, to use symbols for weights and measures, and to commence each prescription with the symbol *R*, which signifies *Recipe*, take. As an illustration, we append a prescription for a tonic draught:

(Name of Patient.)

<i>R</i> Infus. Calumbæ,	f. ʒ 1x
Tinct. Calumbæ,	f. ʒ i
Acid. Sulph. Dilut.,	ʒ x
Syrup. Aurant.,	f. ʒ iss

M. Fiat Haustus ter quotidie sumendus.

Date (in Latin).

(Initials or name of prescriber.)

PRESCRIPTION, in law, is the limit of time within which one may acquire certain legal rights, by reason of the want of vindication by some other person of such rights, and putting in force his legal remedies. In England, however, it has a limited meaning, confined to a certain class of rights relating to lands, such as rights of way, of water-course, of fishing, shooting, etc.; while in Scotland it is a general term, applicable to all legal rights and to real property; and hence prescription in Scotland corresponds to prescription *plus* limitation (q.v.) in England. Prescription in England is thus a mode of acquiring a legal right, incident to land, by the mere force of claiming and exercising it, without dispute, for a certain length of time. Thus, if a neighboring owner has for 30 years, without interruption, actually enjoyed a right of common, such as pasture, fishery, shooting, etc., over another's lands, he will be entitled to it as a legal right forever after, unless in certain exceptional cases; and if he has enjoyed it for 60 years, his title forever after cannot be defeated. So, if a person has for 20 years enjoyed, without interruption, a right of way, or of water-course, or of watering cattle, and similar easements (q.v.) on another's lands, he will be entitled, forever thereafter, to enjoy these, except in a few exceptional cases; and if the enjoyment has been for 40 years, he is entitled in all circumstances. So, if a person whose house adjoins another's lands, and whose windows open upon such land, has enjoyed the light coming to these windows for 20 years, he can forever thereafter prevent his neighbor from building on his land, and thereby darkening such lights. In Scotland prescription includes such rights as have been already mentioned, and also the other substantive rights of property. With respect to servitudes, such as right of way, water-course, fuel, feal, and divot, the right can be gained by the enjoyment for 40 years. Prescription is divided into positive and negative. By the positive prescription whenever one enjoys lands for 40 years, and can show an infetment, or a series of infetments, during such time, though no previous title at the commencement of such period, such person obtains a right to the property. This enactment applies to all kinds of heritable subjects, including leases and servitudes, which require no infetment, and as to which mere possession for 40 years, without interruption, will give the right. By the negative prescription of 40 years, rights are cut off, unless sued for within that period as a debt due on a heritable bond, and on all contracts whatever. Servitudes are also lost by the lapse of 40 years without enjoyment. Besides these prescriptions there are others, called the lesser prescriptions. Thus, there is a 20 years' or vicennial prescription, applicable to certain written contracts; a 10 years' or decennial prescription, applicable to actions against tutors and curators; a 7 years' or septennial prescription, applicable to actions against cautioners; a sexennial or 6 years' prescription, applicable to actions on bills of exchange; a quinquennial or 5 years' prescription, applicable to actions for arrears of rent and verbal contracts; a 3 years' or triennial prescription, applicable to actions on ordinary merchants' accounts, for servants' wages, rent due on a verbal lease, and for work done by workmen, attorneys, etc. With regard to crimes, also, in Scotland but not in England, a 20 years' prescription applies, and no prosecution is competent after that period.

PRESCRIPTION (*ante*), in law, follows in the United States in most points the requirements of the English law. The chief difference is in regard to the length of time during which there must have been adverse possession. This in almost all the states is fixed at 20 years. The uses and enjoyment of the easement or other incorporeal hereditament must be adverse, exclusive, uninterrupted, and continuous; and there must be some person not under disability to resist such use in possession or occupation. When the title is once acquired, it is absolute.

PRESENTATION, the name of the act by which a patron of a living in the established church of Scotland appointed a minister; so called because the presentee had to be presented to the presbytery for inquiry into his qualifications, and for induction, if these were satisfactory. If the patron failed to present within six months, the right then devolved on the presbytery. When a presentee was objected to by the major part of the congregation, whether with or without reason, the general assembly of the church formerly claimed the right to declare that he should not be inducted or entitled to the benefice. This declaration was contained in an act of assembly, dated 1835, called the veto act. But after much litigation, it was decided by the courts of law that such veto act was *ultra vires* and void; and this decision led to a secession of many ministers and people from the established church, and to the formation of a new dissenting church, called the Free church (q.v.). It was then settled by law that it was the presbytery, not the congregation, who were to consider all objections to the presentee, mere dislike on the part of the people not being a ground of rejection. In 1874, however, an act of parliament was passed by which patronage was abolished, and the right of choosing their minister transferred to the congregation. See **PATRONAGE**.

PRESENTATION, ORDER OF. See **SISTERHOODS**.

PRESENTMENT is, in English law, the formal representation made by a grand jury of the finding of an indictment; by church-wardens to the ordinary of the state of the parish; by the court of quarter sessions of the fact of the disrepair of a bridge, etc. Presentment, with reference to bills of exchange, is the formal demand made by the creditor to the debtor, who is primarily liable, calling upon him to accept the bill or to

pay it. If the bill is not paid, then notice of dishonor must be sent to the other parties secondarily liable, who are then bound. See **BILLS OF EXCHANGE**.

PRESERVATION OF WOOD. See **WOOD PRESERVING**, *ante*.

PRESERVES—PRESERVED PROVISIONS, etc. Much variety is comprehended under these terms: the first is generally understood to mean fruits preserved with sugar or brandy; and the latter, such articles of animal or vegetable food as are used ordinarily, but which are preserved by any means for the convenience of carriage, and for use beyond the time they would remain uninjured by ordinary keeping. Fruits intended for confectionery are preserved in four different ways: First, They may be preserved in the form of jam, in which the fruit is simply boiled with from one-half to equal its weight of sugar. By this method, the fruit becomes broken, and the juice set free; but all is preserved, as the latter forms a thick syrup with sugar. Such preserves can be kept, if well made, for several years, but are best used during the first winter. A second plan is to preserve only the juice, which, when carefully strained from the solid portions of the fruit, and boiled with a third or half its weight of refined sugar, constitutes the fruit-jellies of the cooks and confectioners. Another method is called candying, and consists in taking fruits whole or in pieces, and boiling them in a clear syrup previously prepared. In this way they absorb the syrup, and are then dried by a gentle heat, which causes the sugar of the syrup to crystallize on the surface and through the substance of the preserved fruits, which retain their form, and much if not all of their color. The remaining method is to carefully stew them in a weak syrup of refined sugar and water, so that they are rendered soft but are not broken. They are then transferred, with the syrup, to jars with well-prepared covers, to prevent evaporation; and pale brandy, equal in quantity to the syrup, is added. As a rule, only stone-fruits, such as peaches, plums, and cherries, are preserved in this way. Several fruits and vegetables, such as olives, cucumbers, cabbage, etc., are preserved for food in a saturated solution of salt and water poured in hot; others, in vinegar. See **PICKLES**.

But the most approved methods of preserving vegetable and animal substances for food purposes, so as to be used as nearly as possible as if they were in the fresh state, is either to desiccate them or to seal them in air-tight cases. The first method was introduced by M. Chollet of Paris in 1852, and patented in England in 1854. It was, and still is, chiefly applied to vegetables, and a few kinds of fruit, such as apples and pears, which have a small amount of juice. By this method, M. Chollet entirely removes all moisture from the vegetables, by drying either in a vacuum or by the aid of heated air, which reduces their bulk more than one-half. They are then compressed under powerful presses, which, beside rendering them extremely portable, also makes them less liable to absorb moisture from the atmosphere, which is very desirable, as they are very absorbent. In this way, both the color and distinctive flavor of the vegetables are completely preserved, and mere soaking in water restores them almost precisely to their original condition. The introduction of this process has been of great benefit to voyagers, as it enables ships to carry a complete supply of vegetable provisions on the longest voyage.

The method of sealing cooked provisions in air-tight metallic cases, which is now so largely in use, is of comparatively recent invention, and has only been brought into use during the present century. In 1810 Augustus de Heime took out a patent in this country for preserving food in tin or other metal cases, by simply exhausting the air by means of an air-pump; but it was unsuccessful. It was followed by a number of others by various persons, all of which were more or less failures, until Wertheimer's patents, which were three in number, from 1839 to 1841. By his plan, the provisions of whatever kind are put into the metal cases, and closely packed, and the interstices filled in with water or other appropriate liquid, such as gravy in the case of flesh food. The lids are then soldered on very securely; two small perforations are made in each lid, and the cases are set in a water-bath, in which muriate of lime is dissolved, and heat is applied until the whole boils, and the air is expelled through the small openings in the lids of the cases. When this is complete, the small holes are quickly soldered up, and the tins are removed from the bath. The muriate of lime is used because its solution can easily be maintained at a heat of 270° to 280° F., without material evaporation. Other plans have been patented similar in principle, but varying in the mode of applying it. A large business of this kind has for several years been successfully carried on by John Gillon & Co., Leith, and by Moir, Aberdeen, whose cases of preserved meats and soups are well known as an article of commerce. The imports of tinned meat from Australia and New Zealand are now extensive, and are yearly increasing. A very ingenious and scientific plan for preserving meat fresh was invented by prof. George Hamilton of Cheshire. It consists in cutting the meat small, and putting it into jars of binoxide of nitrogen, which perfectly preserves its sweetness and ordinary appearance. This plan has been tried with success on a small scale, and was shown in the Paris exhibition of 1855 as a French discovery, although prof. Hamilton's paper was in Paris in 1854. The fresh meat of late so largely imported from America may be said to be preserved, as it is kept fresh—not frozen—by being packed in chambers cooled by the presence of large quantities of ice. In addition, we have to notice here some recent efforts to preserve animal food. As yet the most successful method is by placing it when boiled in tins of convenient size for household consumption, hermetically sealed from the air. The waste of animal food in Australia

and America had long been a cause of regret, and the sending of it to Europe in a dried state was only partially attempted, when the plan of preserving it in a boiled condition was first tried, on any scale, in 1866 or 1867. Since then, the quantity of Australian and American mutton and beef from Australia and the United States consumed in Great Britain has increased very rapidly. In 1872 the total value of the imports of unsalted meat was not far short of a million sterling. In 1877 the value of the imports of meat, salted and fresh, was over three millions sterling. Of this a value of £1,204,000 was for beef, fresh or slightly salted, from the United States.

The eminent chemist Liebig suggested the manufacture of a concentrated extract of meat; and this is now carried on very extensively both at home and abroad. It is chiefly used by invalids, and for quickly making soups. Only the lean or muscular part is used, and this is boiled until all but the fibrin is dissolved out; the liquid is then concentrated until it is brought to the state of a thick paste, in which state it is easily preserved. Much controversy has of late taken place concerning the nourishing properties, not only of Liebig's, but of all meat extracts. Still those physiologists who have least to say in their favor do not deny that they have some useful properties as food, and their use is decidedly on the increase. The Liebig extract of meat company is said to have slaughtered, in the year 1872, 150,000 head of cattle.

A few years ago, prof. Redwood patented a method of preserving fresh meat by a coating of paraffin; but this substance, from its brittleness, is apt to crack, and we are not aware that it is now in use. Signor Mariotti has patented a rather peculiar plan, which consists in carbonizing the whole surface of the meat by taking advantage of the high temperature of boiling fat into which it is dipped. No way of preserving animal food fresh, however, excels the simple one of storing it in chambers or cabinets at a temperature as little as possible above the freezing-point. By this method large supplies of fresh meat have been conveyed to this country from the United States and Canada in steamers fitted up for that purpose. The value of the beef alone thus imported amounted in 1877 to £1,686,392.

Two large companies, an English and a Swiss, have been lately formed for the supply of condensed milk, and also coffee and cocoa mixed with it and sugar, in such a way as to be ready for use with the addition of boiling water. Coffee so prepared is at present very much in demand.

PRESES OF MEETING, a name given in Scotland to the chairman of a meeting, who is often popularly believed to have some mysterious power or authority; but in point of fact, he has no more power than any other person present, and is merely, for convenience, used as a mouthpiece for putting questions and amendments to ascertain the will of the majority. In meetings of creditors under the bankrupt act, a preses requires to be elected before any business is done; but his power is confined to that of constituting the meeting, and preserving order, so far as the creditors mutually agree to obey his suggestions. As a general rule, a preses, or chairman, has only a single vote, like other persons, and not a casting vote, unless where some act of parliament expressly gives it to him, according to the nature of the meeting held.

PRESIO, a co. in s. Dakota, having the Missouri river on the n. and n.e., and White river for its s. boundary; 1600 sq. m.; formed since the census of '70, still unorganized. Its surface consists of rolling prairies drained by Medicine creek in the n., and adapted to stock-raising and farming.

PRESIDENT OF THE UNITED STATES, the chief executive officer of the United States of North America. The second executive officer is the vice-president, who succeeds to the office of president in case of the removal of the president from office, or of his death, resignation, or inability. The president holds his office during a term of four years, beginning on the 4th day of March next succeeding the day of his election. No person except a native of the United States is eligible to this office. A candidate must be not under 35 years of age, and is chosen by electors who have been chosen by the people. The president receives for his services a compensation of \$50,000 a year, and the constitution forbids his receiving during office any other emolument from the United States or any state. He is commander-in-chief of the army and navy of the United States, and of the militia of the several states when called into the actual service of the United States. He may require the opinion, in writing, of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices, and he has power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment. He also has the power, by and with the advice and consent of the senate, to make treaties, appoint ambassadors, other public ministers and consuls, judges of the supreme court, and all other officers of the United States whose appointments are not otherwise provided for. It is the duty of the president to send to congress, from time to time, a "message" giving information of the state of the union, and recommending to their consideration such measures as he shall judge necessary and expedient. He may, on extraordinary occasions, convene both houses or either of them, and, in case of disagreement between them with respect to the time of adjournment, he may adjourn them to such time as he shall think proper. He receives ambassadors and other public ministers; commissions all the officers of the United States; and must take care that the laws are faithfully executed. He can be removed from

office on impeachment for and conviction of treason, bribery, or other high crimes and misdemeanors. Every bill which passes congress must have the president's signature to become a law, unless, after he has returned it to congress with his objections, two-thirds of each house shall vote in its favor. For the election of a president, each state is entitled to a number of electors equal to its number of senators and representatives in congress, who meet at their respective state capitals on the first Wednesday in January after their election, and transmit their votes to the president of the U. S. senate. The votes are canvassed by the two houses of congress in joint convention, and the result is declared on the second Wednesday in February following the meeting of the electors. Formerly the constitution provided that the person receiving the second highest number of votes for president became vice-president, but the twelfth amendment makes provisions for a separate election of the vice-president. The following list gives the names of those who have held the office of president: George Washington, 1789-97; John Adams, 1797-1801; Thomas Jefferson, 1801-9; James Madison, 1809-17; James Monroe, 1817-25; John Quincy Adams, 1825-29; Andrew Jackson, 1829-37; Martin Van Buren, 1837-41; William Henry Harrison, Mar. 4, 1841-April 4, 1841; John Tyler (succeeded to the office as vice-president), 1841-45; James Knox Polk, 1845-49; Zachary Taylor, 1849 to July 5, 1850; Millard Fillmore (succeeded to the office as vice-president), 1850-53; Franklin Pierce, 1853-57; James Buchanan, 1857-61; Abraham Lincoln, 1861-April 15, 1865; Andrew Johnson (succeeded to the office as vice-president), 1865-69; Ulysses S. Grant, 1869-77; Rutherford B. Hayes, 1877-81; James A. Garfield, 1881. The presidents chosen for a second term of office were Washington, Jefferson, Madison, Monroe, Jackson, Lincoln, and Grant.

PRESIDIO, a co. in s.w. Texas, bounded on the s. by the Rio Grande, and on the e. by the Pecos river; about 15,000 sq.m.; pop. '80, 2,817—1283 of American birth. The surface is even. The soil is sterile except about the streams, and suitable only for grazing. Co. seat, Fort Davis.

PRESCUE ISLE, a co. in the s. peninsula of Michigan, on lake Huron; about 650 sq.m.; pop. '80, 3,113—1450 of American birth. Capital, Rogers City.

PRESS, FREEDOM OF THE, the expression used to denote the absence of any authorized official restraint on publication. The press is an instrument well adapted for disturbing the functions of government, and committing injuries against reputation; and when its power as a political engine was first discovered, the European governments took it into their own hands, no one being allowed to print any work till it had obtained the sanction of the proper authorities. The clergy also, on behalf of the papal hierarchy, claimed a share in the censorship, where questions of religion were concerned. In England, at the reformation, the control of the press came to be more completely centered in the crown than elsewhere, the ecclesiastical in addition to the secular department being vested in Henry VIII. as temporal head of the church. The company of stationers, who came to have the sole right to print, were servants of the government, subject to the control of the star-chamber. The censorship of the press was enforced by the long parliament, and was re-established more rigorously at the restoration. It was continued at the revolution, and the statute regulating it was renewed from time to time till 1693, when the commons, by a special vote, struck it out of the list of temporary acts to be continued. Since that time, the censorship of the press has ceased to exist in Britain. But though there are no official restrictions on what shall and what shall not be published, the authors and publishers of criminal or injurious matter are amenable to the law of libel; and there are certain statutory requirements in force to enable them to be traced. The existing statutes which apply to all printed publications are 39 Geo. III. c. 79, amended by 51 Geo. III. c. 65, 2 and 3 Vict. c. 12, and 32 and 33 Vict. c. 24. Every person who prints anything for hire or reward must, under a penalty of £20, keep one copy at least of the matter printed, and write on it the name and place of abode of the person who employed him to print it. By statute 2 and 3 Vict. c. 12, every person who shall print any paper meant to be published, must print, on the first or last leaf, his name and usual place of business; and on failure to do so, he forfeits the sum of £5, and so does any person publishing the same. There are a few printed papers exempted from conforming to the above requirement—as for instance papers printed by parliament or in government offices, engravings, auction lists, bank notes, bills of lading, receipts for money, and a few other similar matters. In the case of a libel, legal publication is constituted by the sending of a copy printed or in manuscript to a man, and the sale of a newspaper or other publication in a shop, or its delivery to an officer at the stamp-office, is also considered an act of publication. The truth of the statements published may be urged as a plea of defense in an action for libel, but only on the ground of its publication being calculated to promote the public interest. See **LIBEL**. The existing statutes affecting newspapers are 2 Geo. IV. and 1 Will. IV. c. 73, 6 and 7 Will. IV. c. 76, and 32 and 33 Vict. c. 24. If a bill shall be filed in any court for the discovery of the name of the printer, publisher, or proprietor of a newspaper or other publication, with the view of rendering him liable in damages for slanderous matter, the defendant is bound to make the discovery required, which, however, cannot be made use of against him in any other proceeding than that for which it has been made. The penalties against newspapers can only be sued for in the name of the attorney-general or solicitor-general,

or lord advocate. Certain regulations also exist regarding the exhibition of plays, for which see LAWS as to THEATERS. Subject to these restrictions, the freedom of the press has subsisted in Britain since 1693.

A more or less rigorous censorship of the press exists in most European states. There is often no direct supervision previous to publication, but the official censor has it in his power to stop any publication which he deems objectionable, to confiscate the edition, and to prosecute the author and editor. Newspapers and pamphlets are generally subjected to a stricter censorship than larger works.

PRESS, THE. See PRINTERS; PRINTING: also JOURNALISM; NEWSPAPER.

PRESENSE, EDMOND DÉHOUT DE, D.D., b. in Paris, 1824; student of theology at Lausanne, Halle, and Berlin, and in the latter place a friend of Neander; a Protestant preacher of great warmth and vigor of style, and in his writings an energetic opponent of the government church establishment. He was elected deputy from the department of the Seine in 1871, and marked his stay in the assembly by eloquent advocacy of amnesty to the national guards who had joined the commune, of moderation in legislation concerning the "international" organization, of free education, and by a warm support of the republic. Among his works are: *Conférences sur le Christianisme dans son Application aux Questions Sociales*, 1849; *Du Catholicisme en France* 1851; *Histoire des Trois Premiers Siècles de l'Eglise Chrétienne*, 1858; *L'Ecole Critique et Jésus-Christ*, 1863, which is apropos of Rénan's life of Jesus; *La Liberté Religieuse en Europe depuis*, 1870; etc. He was founder of the *Revue Chrétienne*, and the *Bulletin Théologique*. His wife is a well-known authoress.

PRESSING TO DEATH. See PEINE FORTE ET DURE.

PRESSIROS'TRES, a tribe of birds of the order *grallatores*, distinguished by a bill of moderate size, not so strong as in the *cultrirostres*; whilst the hind toe is either wanting, or so short as not to touch the ground. To this tribe belong bustards, plovers, lapwings, oyster-catchers, etc.

PRESSTISSIMO (Ital. very quick) is the most rapid degree of movement known in musical composition.

PRESTER JOHN. See JOHN, PRESTER.

PRESTO (Ital. quick), in music, a direction that a piece should be performed in a rapid lively manner.

PRESTON, a co. in n. West Virginia, adjoining Pennsylvania; drained by Cheat river; on the Baltimore and Ohio railroad; about 595 sq. m.; pop. '80, 19,040—18,369 of American birth, 208 colored. The surface is uneven, traversed by mountain ridges, and heavily timbered. The soil in the valleys is fertile. The principal productions are corn, oats, and live stock. Bituminous coal is found. Co. seat, Kingswood.

PRESTON, an important manufacturing and market t., a municipal and parliamentary borough in Lancashire, on the n. bank of the Ribble, and at the head of the estuary of that river, 27 m. n.n.e. of Liverpool. It occupies an eminence 120 ft. above the Ribble, and it covers an area 2 m. square. The houses are mostly built of brick, and the town is on the whole well laid out, and is surrounded with pleasing scenery. The river is crossed by two bridges and several railway viaducts. There are 14 churches, 7 Catholic and 20 other dissenting chapels. The chief public buildings are the town-hall, of Gothic design, which contains the guild-hall and exchange, and was erected at a cost of upward of £60,000; the Preston and county of Lancaster royal infirmary, erected 1869; the corn exchange and market-house; the house of correction and court-house; the institution for the diffusion of useful knowledge, with a library of 10,000 volumes; the institute and school for the blind. It has also several public libraries; 4 weekly and 2 semi-weekly newspapers. Linen manufactures were formerly the staple, and though still extensive, have been supplanted by the cotton manufacture, which now holds the first place. Preston contains in all about 90 cotton-mills, which give employment to about 27,500 hands. There are also iron and brass foundries, iron ship-building yards, carriage-works, and machine shops; and malting, brewing, and rope-making are also carried on. Preston is a free port, and is reached at spring-tides by vessels drawing 14 feet. In 1872, 816 vessels of 42,695 tons entered and cleared the port. Its imports are chiefly corn, iron, and timber; its exports principally coal. Four great fairs are held here during the year, besides the usual weekly markets. The celebrated guild of merchants, called Preston guild, is still observed here every 20 years. On the last occasion, 1862, the foundation stone of the new town-hall was laid. It is about 700 years since the guild merchant of Preston was acknowledged by royal charter. The first of its 14 royal charters was granted in the reign of Henry II. Preston alone has kept up the celebration of its guild to the present day. The borough returns two members to the house of commons. Pop. '71, 85,427.

PRESTON, JOHN S., b. Va.; 1809; educated at Hampden-Sidney college, and the university of Virginia. He studied law at the Harvard law school, and was admitted to the bar. Marrying a daughter of gen. Wade Hampton, he settled in South Carolina, where he was active in the nullification movement. He had large sugar plantations in Louisiana, but retained his residence in South Carolina, in whose legislature he served, 1848-56. In 1860 he headed the delegation of his state to the democratic convention at

Charleston, but withdrew. He was prominent in the secession movement, and a commissioner from South Carolina to Virginia.

PRESTON, MARGARET (JUNKIN), b. about 1835; resides in Lexington, Va.; daughter of George Junkin, president of Washington college, Va.; married col. J. T. L. Preston, professor in the Virginia military institute. In 1855 she published an admirable translation of the *Dies Ire*; 1856, *Silverwood, a Book of Memories*; 1855, *Bechenbrook, a Rhyme of the War*; 1869, *The Young Ruler's Question*; and is author of several short poems.

PRESTON, THOMAS SCOTT, b. Conn. 1824; graduated at Trinity college, Hartford, in 1843, and at the general theological seminary in New York in 1846; was assistant rector of the church of the Annunciation, and, later, of St. Luke's in New York. In 1849 he went to St. Joseph's theological seminary, Fordham, and was ordained in the Roman Catholic church in 1850; was assistant at the cathedral in New York and pastor of St. Mary's church at Yonkers, N. Y.; appointed in 1853 chancellor of the diocese of New York! in 1873 vicar-general. He has also been pastor of St. Ann's church since 1861. His published works are: *Ark of the Covenant, or Life of the Blessed Virgin*; *Life of St. Mary Magdalene*; *Life of St. Vincent de Paul*; *Sermons for the Seasons of the Sacred Year*; *The Purgatorial Manual*; *Lectures on Christian Unity*; *Reason and Revelation*; *Christ and the Church*; *The Vicar of Christ*.

PRESTON, WILLIAM CAMPBELL, LL.D., 1794-1860; b. Philadelphia; graduated from the South Carolina university in 1812, studied law under Wirt, the noted lawyer and author, and in Edinburgh, Scotland. In 1820 he was admitted to the bar and began practice in Columbia, S. C.; was very successful; in 1824 was sent to congress, and was afterward a member of the state legislature. He was an extreme advocate of free trade, state rights, and nullification. He served as U. S. senator 1836-42, and was prominent in debate.

PRESTONPANS, a village of Haddingtonshire, having a station on the North British railway, $8\frac{1}{2}$ m. e. of Edinburgh. It is supposed to have had salt-pans as early as the 12th c., and possessed thriving manufactures till some time after the reformation. Its present manufacturing industry is limited to that of ale. Pop. '71, 2,064. Near Prestonpans was fought the famous battle of that name, in which the Jacobites under prince Charles Edward completely routed the royal army under sir John Cope, capturing their cannon, baggage, and military chest.

PRESTWICH, a cotton manufacturing village, and township of Lancashire, 4 m. n. w. from Manchester. It has a fine old Gothic church, built in the 13th c., and restored in 1861, also a large county lunatic asylum, erected in 1831. Pop. '71, 6,820.

PRESUMPTION is an inference drawn by the law in certain circumstances or conditions of facts, and is used generally as a mere starting-point in an argument or litigation. Presumptions are often divided into *presumptio juris* and *presumptio juris et de jure*. The former serves as a mere starting-point, and may be rebutted by proof to the contrary. Thus, a person who has possession of goods, is presumed to be the owner till the contrary is proved. A man is presumed to be innocent until the contrary is proved. A *presumptio juris et de jure* is said to be a presumption which cannot be rebutted; but there are few instances of this. Presumptions abound in all departments of the law, and are adopted from the necessity of coming to some conclusion or other in most cases where the evidence is general or inconclusive. Thus, a common illustration is where two persons are drowned at sea, and legal rights depend on the fact which of them survived the other. In such a case, it is presumed, by the law of some countries, that the younger person survives: but there is no presumption in England. But in case of mother and child dying during delivery, the presumption is that neither survived. If a person disappear, and is not heard of, he is presumed to be living. But by an act of parliament this presumption was put an end to, or at least was not allowed to interfere with the right of a married woman to consider herself a widow, after her husband has left her, and has not been heard of for seven years.

PRETENSE, ESCUTCHEON OF, or ESCUTCHEON SURTOUT, in heraldry, a small shield placed in the center of the field of another shield. The husband of an heiress may bear the arms of his wife in an escutcheon of pretense, instead of impaling them. Feudal arms are also sometimes placed on an escutcheon of pretense, particularly in the insignia of elective sovereigns, who have been in use of bearing their own proper arms in surtout over those of the dominions to which they are entitled. The crown of Charlemagne is placed in surtout in the arms of Hanover; and from 1801 to the accession of queen Victoria, the Hanoverian insignia occupied an escutcheon of pretense in the center of the royal arms of the united kingdom.

PRETENDER, OLD and YOUNG. See STUART, CHARLES EDWARD LEWIS CASMIR, *ante*.

PRETOR (probably a contraction for *prætor*, from *præ-co*, to precede, also to order) was, among the ancient Romans, the title given to the consuls as leaders of the armies of the state; but it was specially employed to designate a magistrate whose powers were scarcely inferior to those of a consul. The pretorship, in this specific sense of the term,

was first instituted in 366 B.C., as a compensation to the patricians for being obliged to share with the plebeians the honors of consulship. It was virtually a third consulship; the pretor was entitled *collega consulibus*; he was elected by the same auspices and at the same comitia. For nearly 30 years, patricians alone were eligible for the office; but, in 337 B.C., the plebeians made good their right to it also. The pretor's functions were chiefly judicial. Though he sometimes commanded armies, and, in the absence of the consuls, exercised considerable authority within the city, yet his principal business was the administration of justice both in matters civil and criminal; and "to the edicts of successive pretors," says Mr. G. Long, "the Roman law owes, in a great degree, its development and improvement." Originally, there was only one pretor; but, as the city and state increased, and their relations with other nations became more complicated, others were added. In 246 B.C. a second pretor was appointed, to settle disputes that might arise between Romans and foreigners temporarily resident at Rome, for trading or other purposes, hence called *pretor peregrinus* (foreign pretor), to distinguish him from the original *pretor urbanus* (city pretor). In 227 B.C., two new pretors were appointed, to administrate affairs in Sicily and Sardinia; and in 197 B.C., two more for the Spanish provinces, 6 in all. Sulla increased the number to 8, and Julius Cæsar to 16. Augustus reduced the number to 12; but at a later period we read of 18, if not more. The city pretor-ships were reckoned the highest; and after a person had filled these offices, he sometimes received the administration of a province with the title of *propretor* or *proconsul*.

PRETORIAN BANDS (Lat. *prætorie cohortes*, and *prætoriani*) the name given, more particularly during the period of the Roman empire, to a body of soldiers, organized for the purpose of protecting the person and maintaining the power of the emperors. We indeed read of a *prætorii cohors*, or select guard of the most valiant soldiers attached to the person of Scipio Africanus, who, according to Festus, received six-fold pay, and the exigencies of the civil wars naturally increased their number; but it was to Augustus that the institution of them as a separate force is owing. He formed 9 or 10 cohorts, each consisting of 1000 men (horse and foot); but kept only three of them in Rome, the rest being dispersed in cities not far off. Tiberius, however, assembled the 9 cohorts at the capital in a permanent camp, and Vitellius increased their number to 16. The pretorians served at first for 12, and afterward for 16 years; they received double pay: the privates were held equal in rank to the centurions in the regular army, and on their retirement each received 20,000 sesterces. They soon acquired a dangerous power, which they exercised in the most unscrupulous manner, deposing and elevating emperors at their pleasure. Aspirants for the imperial dignity found it advisable, and even necessary, to bribe them largely; while those who acquired that dignity without their assistance were accustomed on their accession to purchase their favor by liberal donations. The pretorians, however, had no political or ambitious views; they were simply an insolent and rapacious soldiery, fond of substantial gratifications, and careless how they got them. After the death of Pertinax (193 A.D.), they actually sold "the purple" for a sum of money to Didius Julianus; but in the same year their peculiar organization was entirely broken up by Severus, who formed new cohorts altogether out of the best legions serving on the frontiers, which he increased to four times the number of the old. After several other changes, they were entirely abolished by Constantine (312 A.D.), who dispersed them among his regular legions.

PREVENTION OF CRUELTY TO ANIMALS. See ANIMALS, CRUELTY TO.

PREVEZA, or **PREVISA**, a busy trading t. on the n. shore of the strait which forms the mouth of the gulf of Arta. It stands in the portion of Epirus which the congress of Berlin in 1878 recommended Turkey to cede to Greece. Pop. 8,000.

PREVOST, **AUGUSTINE**, 1725-86; b. Switzerland; entered the British army. He was with Wolfe at Quebec, and served through the war of the revolution, in which he attained the rank of maj.gen. He took the fort at Sunbury, Ga., in 1778, made an unsuccessful attempt to capture Charleston in 1779, and in the fall of the same year conducted the successful defense of Savannah against the American forces.

PRÉVOST, **PIERRE**, 1751-1839; b. Geneva, Switzerland; studied medicine and law, taking his degrees in 1773; was a private teacher in Holland and Paris; appointed professor of philosophy at Berlin in 1780; became professor at Geneva of philosophy in 1793, and of physics in 1810; was a member of the representative council of Geneva 1814-23. His principal works are: *De l'Origine des Forces Magnétiques*; *Recherches Physico-Mécaniques sur la Chaleur*; *Traité de Physique Mécanique*. His theory of radiant heat was called Prévost's "theory of exchanges." He edited English classics, and translated several works of English writers.

PREVOST-PARADOL, **LUCIEN ANATOLE**, a distinguished French littérateur, b. at Paris, Aug. 8, 1829; studied at the collège Bourbon and the école normale; in 1851 obtained from the académie the prize for eloquence, and was admitted docteur-ès-lettres in 1855. In that year he was named to the chair of French literature by the faculty of Aix; but in the following year resigned it, and became one of the editors of the *Journal des Débats*, writing generally the leading articles. His advocacy of a responsible ministry brought him into difficulties with the censorship. He was twice an unsuccessful

candidate for a seat in the chamber. In 1865 he was elected a member of the académie. Believing that the empire had at last adopted the principle of parliamentary government, he consented, in 1870, to fill the post of envoy at Washington; but undeceived by the events connected with the proclamation of war with Prussia, he died by his own hand, July 20, 1870. His chief works are: *Revue de l'Histoire Universelle*, 1854; *Essais de Politique et de Littérature*, 1859-63; *Quelques Pages d'Histoire Contemporaine*, 1862-65.

PRIAM, King of Troy at the time of the Trojan war, was the son of Laomedon, and Strymo or Placia. The name Priam (derived from *primus*, to ransom) was given him on account of his having been ransomed by his sister Hesione from Herakles, into whose hands he had fallen. His first wife was Arisbe, daughter of Merops, whom he gave away to a friend in order to marry Hecuba, by whom, according to Homer, he had 19 sons; but as his intercourse with the other sex was not limited to Hecuba, the epic poet gives him in all 50 sons; while later writers add as many daughters. The best-known of these are Hector, Paris, Deiphobos, Helenus, Troilus, and Cassandra. Priam is represented as too old to take any active part in the Trojan war; and in Homer, only once appears on the field of battle. The oldest Greek legends—i.e., the Homeric—are silent respecting his fate; but the later poets—Euripides, Virgil, etc.—say that he was slain by Pyrrhus at the altar of Zeus Herkeios, when the Greeks stormed the city.

PRICE, BONAMY, b. England, 1807; educated at Oxford. He became assistant master in Rugby school in 1830, and professor of political economy at Oxford in 1868. He has written *The Anglo-Catholic Theory*; *The Principles of Currency*, 1869; *Of Currency and Banking*, 1876; and *Practical Political Economy*, 1878. He has positive views to which he gives vigorous expression.

PRICE, RICHARD, was b. at Tynton, in Wales, Feb. 22, 1723. His father, Rice Price, was a dissenting minister, possessed of some wealth, and remarkable for his intolerance. A leading characteristic of his son's mind, on the other hand, was the calm resolution with which, from his youth, he declared his own opinions, and advocated freedom of thought for others. He declined to bend his convictions to paternal authority; accordingly, on his father's death, Richard was so poorly provided for, that, having resolved to prosecute his studies in London, he was obliged to make the journey chiefly on foot. He obtained admission to a dissenting academy, where he acquired a good knowledge of mathematics, philosophy, and theology. At the end of four years he engaged himself as chaplain to a Mr. Streatfield, with whom he lived for 13 years. Mr. Streatfield, on his death, left Price some property; and his circumstances having been further improved by the death of an uncle in 1757, he was enabled to carry out a matrimonial engagement which he had formed with a Miss Blundell.

He then settled as a preacher at Hackney; but being shortly afterward chosen minister at Newington Green, he removed to that place, where he lived till the death of his wife in 1786, when he returned to Hackney. Meanwhile, his life had been one of considerable literary and scientific activity. His *Review of the Principal Questions and Difficulties in Morals* (Lond., 1758), though a somewhat heavy work, established his reputation as a metaphysician and a moralist. In 1769 the degree of doctor of divinity was conferred on him by the university of Glasgow. In the same year he published his *Treatise on Reversionary Payments*; this was followed by the compilation and publication of the celebrated *Northampton Mortality Tables*, and various other works relating to life-assurance and annuities, forming most valuable contributions to the branch of science to which they refer. In 1776 appeared his *Observations on Civil Liberty and the Justice and Policy of the War with America*. Of this work 60,000 copies are said to have been sold in a few months. So greatly was it admired in the United States, that, in 1778, the American congress, through Franklin, communicated to him their desire to consider him a fellow-citizen, and to receive his assistance in regulating their finances; an offer declined principally on the ground of age. He died April 19, 1791. Price was a believer in the immateriality of the soul, holding that it remained in a dormant state between death and resurrection. Their difference of opinion on this subject led to a controversy of some celebrity between him and his friend Dr. Priestley. His views respecting the Son of God were what is called low or semi-Arian. His moral character appears to have been a singularly beautiful one. "Simplicity of manners," says Dr. Priestley, "with such genuine marks of perfect integrity and benevolence, diffused around him a charm which the forms of politeness can but poorly imitate." See *Memoirs of the Life of Richard Price*, D.D., by William Morgan, F.R.S., Lond., 1815.

PRICE, RODMAN M., b. N. J., 1816; educated at the college at Princeton, but did not graduate; studied law, and after his appointment as purser in the U. S. navy, was, it is said, the first to exercise judicial functions in California under the American flag. In 1848 he was made a navy agent on the Pacific coast, but soon returned to New Jersey; was elected to congress by the democratic party in 1851, and governor of the state in 1854. He was a delegate to the peace conference or "congress" of 1861.

PRICE, STEELING, 1809-67, b. Va.; settled in Missouri in 1830, and was soon afterward elected to the state legislature. He was a member of congress 1845-47; was col. of a Missouri volunteer regiment in the Mexican war; was made brig.gen. in 1847, and soon afterward was appointed military gov. of Chihuahua. He was in command at

the battles of Cañada, New Mexico, Jan. 24, 1847, where he was wounded, and of Santa Cruz de Rosales, Mar. 16, 1848. He was governor of Missouri 1853-57, and bank commissioner in 1861. He was the leader of the secession party in the state, and president of the state convention, Feb. 28, 1861. As commander-in-chief of the state forces, he endeavored to force Missouri out of the union. He was compelled to withdraw before gen. Lyon, and on account of the withdrawal of Ben McCullough's troops, was unable to take the state out of the union. Sept. 20 he took Lexington with a large number of prisoners, and was thanked by the confederate congress. In Mar., 1862, he entered the confederate service as maj.gen.; was wounded at Pea Ridge the same month, was at Iuka and Corinth, and led the advance of Pemberton's army in n. Mississippi in December. He was afterward in command of the department of the Arkansas, and in Sept., 1864, invaded Missouri, but was finally driven from the state with heavy loss. After the war he visited Mexico, where he was for some time a member of the board of immigration, but returned to Missouri shortly before his death.

PRICE, THOMAS, 1787-1848; b. at Pencoerelin, Wales; educated for the church at the college of Brecknock; vicar of Cwmdru in 1825. He was an adept in archery and other athletic games. He carved in wood, modeled in wax and cork, etched with success, and played on the harp. The Welsh *Eisteddfods*, or literary gatherings, received his earnest support. He contributed to not less than 15 Welsh periodicals. Besides other works he published in Welsh, *A History of Wales and the Welsh Nation from the Early Ages to the Death of Llewellyn ap Gruffydd*, pronounced the best work on the subject. His most important works are contained in the *Literary Remains of the Rev. Thomas Price, with a Memoir of his Life*, by Jane Williams.

PRICHARD, JAMES COWLES, a distinguished ethnologist and physician, was b. at Ross, in Herefordshire, on Feb. 11, 1786. His father, Thomas Prichard, a member of the society of Friends, and a merchant, had been married young, and was early left a widower with four children, upon whose education he bestowed the greatest care. Of these children, James Cowles, the eldest, was educated at home under private tutors. He learned Latin and Greek from a Mr. Barnes; French from an *émigré* named De Rosemond; and Italian and Spanish from an Italian named Mordenti—while his father himself taught him history, for the study of which young Prichard showed a strong predilection. At Bristol, where his father resided for some time in the pursuit of his business, the embryo ethnologist gave the first indications of his love for the study in which he afterward became famous. On the quays, he met with foreigners from every country, and took much interest in observing their physical appearance, occasionally conversing with the sailors and others, as well as he was able, in their native tongues. On retiring from business, his father again took up his abode at Ross, where the son continued to pursue his studies under private tutors. When the time for choice of a profession arrived, young Prichard chose that of medicine as the one he thought most akin to his ethnological pursuits. He accordingly became a student of medicine, first at Bristol, afterward at St. Thomas's hospital, London, and finally at Edinburgh, where he took his degree of M.D. Before commencing practice, however, he entered himself a student at Trinity college, Cambridge, where he read mathematics and theology for the most part. Subsequently he studied at St. John's college and Trinity college, Oxford. In 1810 he commenced practice in Bristol as a physician. His talents were soon recognized, both privately and publicly. He was first appointed physician to the Clifton dispensary and St. Peter's hospital, and afterward physician to the Bristol infirmary. In 1813, he published his first work, *Researches into the Physical History of Mankind*, which at once gave him a high standing as an ethnologist. Of this, a second and enlarged edition, in 2 vols., appeared in 1826; and a third, still further improved and enlarged, in 5 vols., appeared between the years 1836 and 1847. The second and third editions of this work, each in succession, gave remarkable proofs of the extraordinary zeal with which Dr. Prichard pursued his ethnological investigations; and not only so, for at the same time he devoted himself much to the pursuit of philology, which he rightly judged to be absolutely necessary to an enlarged study of ethnology. In a few years he became acquainted, not only with the Teutonic and Celtic languages, but with Sanskrit, Hebrew, and Arabic, showing a practical result of his studies in the publication of his work entitled *The Eastern Origin of the Celtic Nations*. In this publication, which appeared at Oxford in 1831, he compared the different dialects of the Celtic with the Sanskrit, Greek, Latin, and Teutonic languages, and succeeded in proving a strong affinity between them all, from which he argued in favor of a common origin for all the peoples speaking those languages. His theory has met with general acceptance; and the work in which it appeared, says Mr. Norris, "is admitted by the most distinguished philologists to be unsurpassed in ability and soundness, while not a few deem it to be that which has made the greatest advance in comparative philology during the present century." A previous work—namely, his *Analysis of Egyptian Mythology*, first published in 1819, had the honor of being translated into German in 1837, and edited by A. W. Schlegel, who, however, took occasion to dissent from some of the author's views. In 1843 Dr. Prichard published the first edition of his *Natural History of Man*, in 2 vols. Two other editions of this work appeared during the author's lifetime; and a fourth, ably edited and enlarged, by Mr. Edwin Norris, was given to the world in 1855. Dr. Prichard's other publi...ed

works are for the most part on medical subjects—namely, *History of the Epidemic Fevers which prevailed in Bristol during the years 1817, '18, and '19*, published in 1820; *Treatise on Diseases of the Nervous System* (1822); *A Treatise on Insanity and other Diseases affecting the Mind* (1835); and *On the Different Forms of Insanity in Relation to Jurisprudence* (1842). He also contributed various articles to the *Cyclopaedia of Practical Medicine* and to the *Library of Medicine*. As a tribute to his eminence as an ethnologist, Dr. Prichard was elected president to the ethnological society; while, in recognition of his researches into the nature and various forms of insanity, he received the government appointment of commissioner in lunacy. This occasioned his removal from Bristol to London, where, unfortunately for the interests of science, he expired of rheumatic fever, Dec. 22, 1848, at the comparatively early age of 62. Dr. Prichard's fame as the greatest of ethnologists, which, during his lifetime, was universally acknowledged, remains undisturbed to this day, notwithstanding any difference of opinion as to his favorite doctrine of the unity of the human race, which he constantly upheld. He was the first to raise ethnology to the rank of a science, and in his work, *The Physical History of Mankind*, he has left behind him a noble monument of his genius, skill, and perseverance.

PRICKLE, *Aculeus*, in botany, a strong and hard, elongated and pointed hair. See **HAIRS**, in *botany*.—The prickle is connected only with the bark, and not with the wood, in which it essentially differs from the spine or thorn. Prickles are sometimes straight, sometimes curved. They have often a pretty extended base—of some definite shape—by which they are attached to the bark.

PRICKLY ASH. See **ARALIA**; **XANTHOXYLUM**, *ante*.

PRICKLY HEAT is the popular name in India and other tropical countries for a severe form of the skin disease known as *tichen*. It more frequently attacks strangers from temperate climates than the natives, although the latter are not altogether exempt from it. The sensations of itching and stinging which attend it are intense, and give rise to an almost irresistible propensity to scratching, which of course only aggravates the irritation. Little or nothing can be done in the way of treatment, except keeping as cool as possible; but the remedies recommended in the article **LICHEN** may perhaps slightly alleviate the symptoms.

PRICKLY PEAR, or **INDIAN FIG**, *Opuntia*, a genus of plants of the natural order *cactaceæ* (q. v.), having a fleshy stem, generally formed of compressed articulations, sometimes of cylindrical articulations; leafless, except that the youngest shoots produce small cylindrical leaves, which soon fall off; generally covered with clusters of strong hairs or of prickles; the flowers springing from among the clusters of prickles, or from the margin or summit of the articulations, solitary, or corymboso-paniculate, generally yellow, rarely white or red; the fruit resembling a fig or pear, with clusters of prickles on the skin, mucilaginous, generally catable—that of some species pleasant, that of others insipid. The fruit imparts a red color to the urine. The prickles of some species are so strong, and their stems grow up in such number and strength, that they are used for hedge-plants in warm countries.—The **COMMON PRICKLY PEAR** or **INDIAN FIG** (*O. vulgaris*), a native of Virginia and more southern parts of North America, is now naturalized in many parts of the s. of Europe and n. of Africa, and in other warm countries. It grows well on the barest rocks, and spreads over expanses of volcanic sand and ashes too arid for almost any other plant. It is of humble growth; its fruit oval, rather larger than a hen's egg, yellow, and tinged with purple, the pulp red or purple, juicy, and pleasantly combining sweetness with acidity. It is extensively used in many countries as a substantive article of food. In the s. of England the prickly pear lives in the open air, and occasionally ripens its fruit. In America it is cultivated considerably to the n. of its native region. Lime rubbish is often mixed with the soil in which it is to be planted. The fruit is imported into Britain, to a small extent, from the Mediterranean.—The **DWARF PRICKLY PEAR** (*O. nana*), very similar, but smaller, and having prostrate stems, is naturalized in Europe as far n. as the sunny slopes of the Tyrol.—The **TUNA** (*O. tuna*), much used in some parts of the West Indies as a hedge-plant, and also valuable as one of the species which afford food to the cochineal insect, yields a pleasant fruit. It has red flowers, with long stamens, which display a remarkable irritability.

PRIDE, in heraldry. A peacock, or other bird, when the tail is spread out in a circular form, and the wings dropped, is said to be "in his pride."

PRIDEAUX, **HUMPHREY**, an English scholar and divine, was b. of an ancient and honorable family at Padstow, in Cornwall, May 3, 1648. He was educated first at Westminster school, under Dr. Busby; and afterward at Christ church, Oxford, where he took the degree of B. A. in 1672. In 1676 he published an account of the Arundelian Marbles, under the title of *Marmora Oxoniensis*, which greatly increased his fame as a scholar, and in the following year took the degree of M. A. The *Marmora* procured for Prideaux the friendship of the lord chancellor Finch (afterward earl of Nottingham), who, in 1679, appointed him rector of St. Clement's at Oxford, and in 1681 a prebendary of the cathedral of Norwich. After several minor preferments he was collated, in 1688, to the archdeaconry of Suffolk; and in 1702 was made dean of Norwich. He died Nov. 1, 1724. His principal works are his *Life of Mahomet* (1697), which was

long very popular, and has gone through many editions, but is now entirely superseded; and *The Connection of the History of the Old and New Testament* (1715-18). The last of these treats with much learning, but less discernment, the affairs of ancient Egypt, Assyria, Persia, Judea, Greece, and Rome, as far as they bear on the subject of sacred prophecy. Prideaux was a zealous but not an intolerent churchman, most conscientious in the discharge of his own duties, equally anxious that others should do theirs, and possessed of a considerably greater share of piety than was usual in his age.

PRIDEAUX, JOHN, 1718-59; b. England; son of sir John Prideaux, bart.; took part in the battle of Dettingen in 1743; fought in America against the French; became col. and brig.gen.; was intrusted by William Pitt with the command of the expedition to reduce fort Niagara, in 1759, and while preparing for the siege was killed in the trenches by the accidental bursting of a gun.

PRIDE OF INDIA, PRIDE OF CHINA, or bead tree. An oriental tree which has become naturalized in most warm countries. It is a species of the genus *melia*, of the family *melastomæ*. The pride of India, *melia azedarach*, is a native of India and China, and attains a height of from 20 to 40 ft., and a diameter of trunk of about 3 ft. The leaves are bipinnate, each division having five lance-ovate, acuminate, and serrate leaflets. The flowers are in large axillary lilac-colored panicles; calyx small, corolla with spreading petals; stamens 10, united into a tube which forms a conspicuous part of the flower. Fruit about as large as a cherry, ovoid in shape and fleshy, containing a five-celled, five-seeded, elongated, bony nut. The tree is quite common in the southern United States. It is rapid of growth, soon producing an ample shade, but the odor is rather unpleasant. The bark of the root, in which the active principle resides, has been used in medicine from time immemorial as a vermifuge, and it resembles in its physiological and therapeutic action the *spigelia marylandica*, or Carolina pink. Conflicting statements are made in regard to the effects of the berries, some accounts stating that children have been poisoned by eating them, while others are to the contrary. They are eaten by birds and horses and cows, and horses eat the leaves without injury. As a vermifuge the root-bark is used in the form of a decoction, made by boiling two ounces of the bark in a pint of water till it is reduced to one-half. For a child of three to five years a tablespoonful of this is given every three hours till the stomach and bowels are affected, and it should be followed by a cathartic, or infusion of senna may be given with it, as with pink root.

PRIEGO, a t. of Andalusia, Spain, 45 m. s.e. of Cordova. The inhabitants of Priego are chiefly occupied in husbandry. There are oil-mills, flour-mills, tanneries, and potteries. There were formerly very important silk manufactures, but these have become inconsiderable. Pop. over 13,000.

PRIESSNITZ, VINCENT, the founder of hydropathy (q. v.), was born at Gräfenberg (q. v.), in Austrian Silesia, Oct. 5, 1799. He was the son of a peasant-proprietor, and received at the school of Freiwaldau an education suitable to his station, and afterward farmed his paternal estate. It appears that a neighbor, who had been in the way of healing trifling wounds on himself and others by means of cold water, treated Priessnitz successfully in this way for a serious injury from the kick of a horse; and Priessnitz, having thus had his attention directed to the virtues of cold water, and being indisputably possessed of great sharpness of intellect and aptitude for the practice of the healing art, began to give advice to his neighbors how to cure all ailments with cold water, and soon attained considerable reputation among them. Although several times brought before the authorities for unlicensed practicing, the simplicity of the means he used made it impossible to interfere with him. As the number of applicants for advice went on increasing, he gradually came, by experimental modifications of the way of applying his remedy, to form a kind of system of treatment for the various cases that presented themselves. At last, about 1826, strangers began to repair to Gräfenberg, and stay there for some time for treatment; in 1829 there were as many as 49 water-patients, and in 1837 the number had risen to 586. Priessnitz continued till 1833 to carry on his farming; but after that, his practice, and the care of the establishments which he had to provide for the reception and treatment of his patients, fully occupied him. He died Nov. 28, 1851, leaving his establishment to his son-in-law. Very different judgments have been pronounced on the character of Priessnitz and his system of treatment, mostly according to the prejudices of the critics. He himself has left nothing in writing on his method of cure.—Wunde, *Die Gräf. Wasserheilanstalt und die Priessnitzsche Curmethode* (6th ed., Leip. 1845).

PRIEST (Gr. *presbyteros*, Lat. *presbyter*, Fr. *prêtre*), the title, in its most general signification, of a minister of public worship, but specially applied to the minister of sacrifice or other mediatorial offices. In the early history of mankind, the functions of the priest seem to have commonly been discharged by the head of each family; but on the expansion of the family into the state, the office of priest became a public one, which absorbed the duties as well as the privileges which before belonged to the heads of the separate families or communities. It thus came to pass that in many instances the priestly office was associated with that of the sovereign, whatever might be the particular form of sovereignty. But in many religious and political bodies, also, the orders

were maintained in complete independence, and the priests formed a distinct and, generally speaking, a privileged class (see *Egyptian Priests, Indian Priests*, below). The priestly order, in most of the ancient religions, included a graduated hierarchy; and to the chief, whatever was his title, were assigned the most solemn of the religious offices intrusted to the body. In sacred history, the patriarchal period furnishes an example of the family priesthood; while in the instance of Melchizedec, king of Salem, we find the union of the royal with the priestly character. In the Mosaic law, the whole theory of the priesthood, as a sacrificial and mediatorial office, is fully developed. The priest of the Mosaic law stands in the position of a mediator between God and the people; and even if the sacrifices which he offered be regarded as but typical and prospective in their moral efficacy, the priest must be considered as administering them with full authority in all that regards their legal value. The Mosaic priesthood was the inheritance of the family of Aaron, of the tribe of Levi. It consisted of a high-priest (q.v.), and of inferior ministers, distributed into 24 classes. The age for admission to the priesthood is nowhere expressly fixed; but from 2d Chronicles xxxi. 17, it would seem that the minimum age was 20. In the service of the temple, the priests were divided into 24 classes, each of which was subject to a chief priest, and served, each company for a week, following each other in rotation. Their duties in the temple consisted in preparing, slaying, and offering victims; in preparing the show-bread, burning the incense, and tending the lights of the sanctuary. Outside, they were employed in instructing the people, attending to the daily offerings, enforcing the laws regarding legal uncleanness, etc. For their maintenance were set aside certain offerings (see FIRST-FRUITS) and other gifts. They wore a distinguishing dress, the chief characteristics of which were a white tunic, an embroidered cincture, and a turban-shaped head-dress. The Jewish priesthood may be said to have practically ceased with the destruction of the temple.

In the Christian dispensation, the name primitively given to the public ministers of religion was *presbyteros*, of which the English name "priest" is but a form derived through the old French or Norman *prestre*. The name given in classical Greek to the sacrificing priests of the pagan religion, Gr. *hierews*, Lat. *sacerdos*, is not found in the New Testament explicitly applied to ministers of the Christian ministry; but very early in ecclesiastical use, it appears as an ordinary designation; and with all those bodies of Christians, Roman Catholics, Greeks, Syrians, and other orientals who regard the Eucharist as a sacrifice (see MASS), the two names were applied indiscriminately. The priesthood of the Christian church is one of the grades of the hierarchy (q.v.), second in order only to that of bishop, with which order the priesthood has many functions in common. The priest is regarded as the ordinary minister of the Eucharist, whether as a sacrament or as a sacrifice; of baptism, penance, and extreme unction; and although the contracting parties are held in the modern schools to be themselves the ministers of marriage, the priest is regarded by all schools of Roman divines as at least the normal and official witness of its celebration. The priest is also officially charged with the instruction of the people and the direction of their spiritual concerns, and by long-established use, special districts, called parishes (q.v.), are assigned to priests, within which they are intrusted with the care and supervision of the spiritual wants of all the inhabitants. The holy order of priesthood can only be conferred by a bishop, and he is ordinarily assisted by two or more priests, who, in common with the bishop, impose hands on the candidate. The rest of the ceremonial of ordination consists in investing the candidate with the sacred instruments and ornaments of his order, anointing his hands, and reciting certain prayers significative of the gifts and the duties of the office. The distinguishing vestment of the priest is the *chasuble* (Lat. *planeta*). In Roman Catholic countries, priests wear even in public a distinctive dress, which, however, in most respects is common to them with the other orders of the clergy. In the Latin church, priests are bound to a life of celibacy. In the Greek and oriental churches, married men may be advanced to the priesthood; but no one is permitted to marry after ordination, nor is a married priest permitted to marry a second time, should his wife die.

In the church of England, and other Reformed Episcopal churches, the term priest is retained as the designation of the second order of clergy, whose special office it is (1) to celebrate the sacrament of the Lord's-supper; (2) to pronounce the forms of absolution in the morning and evening prayer, in the communion service, and in the office for the visitation of the sick; and (3) to preach, though this last office is, by special license, sometimes extended to deacons.

Priests only can hold a benefice with cure of souls. The age for admission into the priesthood is 24 years. (For the manner and ceremonies of admission see ORDINATION.) Priests in the church of England are ordinarily distinguished during divine service by a black stole of silk worn upon the surplice over both shoulders; deacons, according to the ancient use, wearing it over one shoulder only. Marriage is permitted in the church of England to all orders of the clergy.

Egyptian Priests.—In the political division of Egypt the population is supposed to have been divided into three or four castes, at the head of which was the sacerdotal, or priests. This division, however, was not very strictly observed, as the son did not invariably follow the profession of the father. That of the priest appears most honorable, and two principal classes of priests were in existence at the earliest periods—the *hont*, or prophets, and the *ab*, or inferior priests. The first were attached to the worship of

all the deities of Egypt; and in the greater cities there was *hont api*, high prophet, or priest, who presided over the others; at Thebes there were as many as four prophets of Ammon. Their duties appear to have comprised the general cultus of the deity. They also interpreted the oracles of the temples. Besides the prophets of the gods, others were attached to the worship of the king, and to various offices connected with the administration of the temples. The class of priests called *ab*, or "pure," were inferior, and were also attached to the principal deities, and to the personal worship of the monarch. They were presided over by a superintendent, but had no high-priest. A third class of priests, the *karheb*, appear in connection with funeral and other ceremonies, and some other inferior persons of the hierarchy. The *scribes* formed a caste apart, but those who were attached to the temple were of the priestly order. Besides these above mentioned, the Greeks enumerate a variety of sacred officials. The administration of the temples by the hierarchy was as follows: The temple was governed by a superintendent, or *epistetes*, called in Egyptian *mer*, either the high-priest or a prophet. Under him was a vicar, and a royal officer, called *epimelctes*, or overseer, by the Greeks. These attended to the receipts and expenses. Lay brethren, or *hierodules*, attended and assisted the priests in their functions; and in addition to these there were a kind of monks in the Serapeum, who lived within the precincts of the temple, which they were not allowed on any account to quit. At Alexandria, under the Ptolemies, there was a priest of Alexander the great, and others attached to the worship of the deceased Ptolemies, and also one attached to the worship of the living monarch. This priest, it appears, was nominated by the king himself, and drew a revenue from the different temples of Egypt. He was at this period the high-priest of the whole country, and had no doubt superseded the former high-priest of Ptah at Memphis, and of Amen-Raat Thebes, who had formerly exercised a kind of pontificate. On solemn occasions a synod of the priests was held for purposes affecting the whole body. Some light has been thrown on the relative dignities of the hierarchy by the hieroglyphical inscription on a statue of Bakenkhonsou, a high priest of Amen-Ra, now at Munich. At the age of 16 he held a civil employment under Sethos I.; he was then made priest *ab* of Amen-Ra, which office he exercised for four years; after this he rose to the rank of "divine father" of the god, which office he held for 12 years; after that, he became third prophet of the same deity for 15 years; then second prophet for 12 years; and finally, at the age of 59, chief prophet or high-priest of the god—held the post for 27 years, and died at the age of 86. The youthful age at which offices were held was probably owing to the careful education which the young priests had to undergo, and the habits required for the order. They were required to be scrupulously neat and clean, entirely shaven, clad in linen, and shod with papyrus sandals, and to maintain a rigid diet, in which was a careful abstaining from pork, mutton, beans, and salt, to which was added a bath twice a day, and other ablutions. They also fasted, and one of their fasts lasted 42 days; others even longer; they then lived on vegetable food alone, and exercised a rigid continence. They were, however, not unmarried, but allowed one wife. Their support was derived from various sources—as from royal and other endowments of the temples, from the gifts of votaries, and from charges on the produce of the country. On festivals not only were they often clad in fine linen, but the addition of a panther-skin was often added to their attire; and they were anointed with perfumes and unguents. They offered water and burning incense. Although Herodotus has stated that no woman was a priestess in Egypt, many functions connected with the temples were held by women. The most important was that of "divine wife of Amen-Ra," called by Diodorus the *palakis*, or concubine, of Jupiter, which was conferred upon queens and princesses only. Another title was that of "divine hand," or adorer of the same god, a rank also held by royal personages. During the 4th dynasty, at the time of Cheops and the pyramids, there were prophetesses; but the order does not appear to have been kept up, for at a later period there only appear the *sua*, or singing women of the gods, and the *aha*, or performers, of the principal deities, who attended with *sistra* at the festivals. Besides these, other women had charge of certain things connected with the temple, and *canephoroi*, or basket-bearers. They had no distinctive dress, and were often the wives of prophets or other priests.—Boeck, *Corp. Inscr. Græc.*, p. xxix. p. 303; Schmidt, *De Sacerdot. Ægyptior.*; Wilkinson, *Manners and Customs*, vol. i. p. 257; Devéria, *Monument de Bakenkhonsou* (Paris, 1862).

Indian Priests.—The priesthood of India belongs to the first caste, or that of the Brâhman'as exclusively; for no member either of the Kshatriya, or the Vais'ya, or the Sûdra caste is allowed to perform the functions of a priest. But as the proper performance of such functions requires, even in a Brâhman'a, the knowledge of the sacred texts to be recited at a sacrifice, and of the complicated ceremonial of which the sacrificial acts consist, none but a Brâhman'a learned in one or more Vedas (q. v.), and versed in the works treating of the ritual (see KALPA-SÛTRA), possesses, according to the ancient law, the qualification of a priest; and so strict, in ancient times, were the obligations imposed upon a priest, that any defective knowledge on his part, or any defective performance by him of the sacrificial rites, was supposed to entail upon him the most serious consequences both in this life and in the future. As the duration of a Hindu sacrifice varies from one to a hundred days, the number of priests required at such a ceremony is likewise stated to be varying; again, as there are sacrificial acts at which verses from the Rîgveda only were recited; others requiring the inaudible muttering of verses from the

Yajurveda only; others, again, at which verses only of the Sāmaveda were enacted; and others, too, at which all these three Vedas were indispensable—there were priests who merely knew and practiced the ritual of the R̥gveda, or the Yajurveda, or the Sāmaveda; while there were others who had a knowledge of all these Vedas and their rituals. The full contingent of priests required at a great sacrifice amounts to 16. Other inferior assistants at a sacrifice, such as the ladle-holders, slayers, choristers, and the like, are not looked upon as priests. Such was the staff of priests required at the great and solemn sacrifices which took place on special occasions, and could be instituted only by very wealthy people; from one to four priests, however, sufficed at the minor sacrifices, or those of daily occurrence. These were the rules and practices when the Hindu ceremonial obeyed the canon of the Vaidik ritual; and the latter probably still prevailed at the epic period of India, though many deviations from it are perceptible in the Mahābhārata and Rāmāyan'a (q. v.). But at the Paurāṇik period, and from that time downward, when the study of the Vedas had fallen into disuse, and the Vaidik rites had made room for other ceremonies which required no knowledge on the part of a priest, except that of the reading of a prayer-book, and an acquaintance with the observances enjoined by the Purāṇas, but easy to go through, almost every Brāhman, not utterly ignorant, became qualified to be a priest. For the priesthood of the Buddhists, Jainas, and Thibetans, see BUDDHISM, JAINAS, and LAMAISM.

PRIESTLEY, JOSEPH, son of Joseph Priestley, a cloth-draper at Fieldhead, near Leeds, was born at Fieldhead, Mar. 13, 1733, O.S. His mother having died when he was six years old, he was adopted by an aunt, by whom he was sent to a free school. There he learned Latin and Greek. During vacation, he taught himself various languages, both ancient and modern. For some time he was obliged to abandon his studies, owing to weak health; he then betook himself to mercantile pursuits. With returning strength, his literary studies were resumed, and successfully prosecuted at a dissenting academy at Daventry under Mr. (afterward Dr.) Ashworth, successor to Dr. Doddridge. Though his father and aunt were strong Calvinists, their house was the resort of many men who held very different opinions; and the theological discussions which he was in the habit of hearing seem to have had much effect on young Priestley: before he was 19 he calls himself rather a believer in the doctrines of Arminius, but adds, "I had by no means rejected the doctrine of the trinity or that of the atonement." Before leaving home, he wished to join a Calvinistic communion; but he was refused admission, the ground of refusal being that he had stated doubts as to the liability of the whole human race to "the wrath of God and pains of hell forever." During his residence at the academy, he conceived himself called on to renounce nearly all the theological and metaphysical opinions of his youth. "I came," he says, "to embrace what is called the heterodox side of every question." In 1755 he became minister to a small congregation at Needham Market, in Suffolk, with an average salary of £30 per annum. While here, he composed his work entitled *The Scripture Doctrine of Remission, which shows that the Death of Christ is no proper Sacrifice nor Satisfaction for Sin*. His leading theological doctrine seems to have been that the Bible is indeed a divine revelation, made from God to man through Christ, himself a man and no more, nor claiming to be more. He seems to have rejected all theological dogmas which appeared to him to rest solely upon the interpretation put upon certain passages of the Bible by ecclesiastical authority. Even the fundamental doctrines of the trinity and of the atonement he did not consider as warranted by Scripture, when read by the light of his own heart and understanding. It does not, however, appear that these doctrinal errors produced any morally evil results. He not only contrived to live on £30 a year; but, by adding a little to his income by means of teaching, he was enabled to purchase a variety of instruments to help him in his scientific studies. In 1758 he quitted Needham for Nantwich; and in 1761 he removed to Warrington, where he was appointed successor to Mr. (afterward Dr.) Aikin, as teacher of languages and *belles-lettres*. At Warrington, he married Miss Wilkinson, a lady of great talent and amiability. Here his literary career may be said first fairly to have begun. A visit to London led to his making the acquaintance of Franklin and of Dr. Price. The former supplied him with books which enabled him to write his *History and Present State of Electricity*, published in 1767. It was followed by a work on *Vision, Light, and Colors*. In 1762 he published his *Theory of Language and Universal Grammar*. In 1766 he was made a member of the royal society, and a doctor of laws by the university of Edinburgh. In the following year he removed to Millhill, near Leeds, where he was appointed minister of a dissenting chapel. The fact of a brewery being beside his dwelling gave a new direction to his energetic and versatile mind; he began to study pneumatic chemistry, publishing various important works connected with this science. "No one," says Dr. Thomson, "ever entered on the study of chemistry with more disadvantages than Dr. Priestley, and yet few have occupied a more dignified station in it." While at Leeds, he agreed to accompany capt. Cook on his second voyage; but certain ecclesiastics having objected to the latitude of his theological views, the board of longitude refused to sanction the arrangement, and he did not go. In 1773 he was appointed librarian and literary companion to lord Shelburn, with a salary of £250 per annum, and a separate residence. He accompanied the earl on a continental tour in the year 1774. Having been told by certain Parisian savants that he was the only man they

had ever known, of any understanding, who believed in Christianity, he wrote, in reply, the *Letters to a Philosophical Unbeliever*, and various other works, containing criticisms on the doctrines of Hume and others. His public position was rather a hard one; for while laughed at in Paris as a believer, at home he was branded as an atheist. To escape the odium arising from the latter imputation, he published in 1777 his *Disquisition Relating to Matter and Spirit*. In this work, while he partly materializes spirit, he at the same time partly spiritualizes matter. He holds, however, that our hopes of resurrection must rest solely on the truth of the Christian revelation, and that on science they have no foundation whatever. The doctrines of a revelation and a resurrection appear with him to have supported one another. He believed in a revelation, because it declared a resurrection; and he believed in a resurrection, because he found it declared in the revelation. On leaving lord Shelburn, he became minister of a dissenting chapel at Birmingham. The publication, in 1786, of his *History of Early Opinions Concerning Jesus Christ*, occasioned the renewal of a controversy which had begun in 1778 between him and Dr. Horsley, concerning the doctrines of free will, materialism, and unitarianism. The victory in this controversy will probably be awarded by most men in accordance with their own preconceived views on the questions at issue. His reply to Burke's *Reflections on the French Revolution* led to his being made a citizen of the French republic; and this led to a mob on one occasion breaking into his house and destroying all its contents, books, manuscripts, scientific instruments, etc. He states that the sum awarded to him as damage fell £2,000 short of the actual pecuniary loss. A brother-in-law, however, about this time left him £10,000, with an annuity of £200. In 1791 he succeeded to the charge at Hackney, which had become vacant by the resignation of Dr. Price. He did not remain long here, however. His honestly-avowed opinions had made him as unpopular as an honest avowal of opinions generally does. He removed to America, where he was received with respect, if not with enthusiasm. He had the offer of the professorship of chemistry at Philadelphia, which he declined. In 1796 his wife died. To the day of his death, he continued to pursue his literary and scientific pursuits with as much ardor as he had shown at any period of his active life. He died Feb. 6, 1804, expressing his satisfaction with his having led a life so useful, and his confidence in immortality. At Paris, his *éloge* was read by Cuvier before the national institute. He has given us his autobiography down to Mar. 24, 1795. He was a man of irreproachable moral and domestic character, remarkable for zeal for truth, patience, and serenity of temper. He appears to have been fearless in proclaiming his convictions, whether theological, political, or scientific. See memoirs of his own life, continued by his son, with observations by T. Cooper. Also life by John Corry.

PRIESTS OF THE ORATORY. See ORATORY, CONGREGATION OF THE, *ante*.

PRILOO KI, a district t. of Little Russia, in the government of Poltava, and 150 m. n.w. of the town of that name. Tobacco, corn, cattle, and tallow are the principal articles of trade, and are sold on the spot to dealers for export to Moscow, St. Petersburg, Riga, Poland, and abroad. The climate is good, and the soil fertile. Pop. '67, 10,670, most of whom are engaged in the cultivation of tobacco.

PRIM, JUAN, Count of Reus, 1814-70; b. Spain; entered the army at an early age. For the assistance which he rendered Narvaez in securing the downfall of Espartero in 1843, he was made count, and appointed gen. and gov. of Madrid. In 1844, on account of his defection from Narvaez, the latter had him sentenced to imprisonment for 6 years. He was soon pardoned by the queen, who made him gov. of Porto Rico. He led the progressive party in the cortes 1848-53, was in exile 1853-58, and commanded the Spanish army in Morocco 1859-60. For his victory at Los Castillejos he was made marquis de los Castillejos. In 1862 he was commander of the Spanish troops in Mexico, who were intended to act in conjunction with the French and English forces, but left on account of his unwillingness to assist Napoleon III. In 1864 he was driven from Madrid, accused of participating in a military conspiracy, and in 1866 he began an unsuccessful insurrection against the O'Donnell government. In 1868, in association with Serrano and Topete, he dethroned Isabella. Serrano became regent, and Prim was appointed commander-in-chief, minister of war, and president of the council. Prim's selection in 1870 of prince Leopold of Hohenzollern brought on the Franco-Prussian war. He afterward called Amadeus to the throne, but died from wounds inflicted by assassins before Amadeus arrived at Madrid.

PRIMA DONNA (Ital.), the first female singer in an opera.

PRIMAEY, or PRIMITIVE LIMESTONE, the name formerly given to crystalline limestones, because it was supposed that they belonged to the oldest primary deposits. But as it is now known that many of these limestones are of much later origin, some even as late as the tertiary period, the name has fallen into disuse. See MARBLE.

PRIMATE (Lat. *primus*, Fr. *primat*, first) is the title of that grade in the hierarchy which is immediately below the rank of patriarch. The title strictly belongs to the Latin church, but in its general use it corresponds with that of exarch (Gr. *exarchos*) in the Greek church, although there were some exarchs who were not immediately subject (as were all primates) to a patriarch. This arose in the eastern church from the variation in the limits of the patriarchates, which were not of simultaneous origin; but in the

west, where the patriarch (i.e., the Roman bishop) was recognized as possessing universal jurisdiction, this exemption of any particular primate from superior jurisdiction could not of course arise. The primate, as such, was the head of a particular church or country, and held rank, and, in some churches, a certain degree of jurisdiction, over all bishops and archbishops within the national church. This jurisdiction, however, was confined to the right of visitation and of receiving appeals. In Africa, the bishop of Carthage, without the title, possessed all the rank and authority of a primate. The chief primatial sees of the west were: in Spain, Seville and Tarragona, afterwards united in Toledo; in France, Arles, Rheims, Lyons, and Rouen (among whom the archbishop of Lyons claims the title of *primat des primats*, "primate of the primates"); in England, Canterbury; in Germany, Mainz, Salzburg, and Trier; in Ireland, Armagh, and for the Pale, Dublin; Scotland, St. Andrews; in Hungary, Gran; in Poland, Gnesen; and in the northern kingdoms, Lund. In the church of England the archbishop of Canterbury is styled primate of all England; the archbishop of York, primate of England.

In Ireland, the archbishop of Armagh is primate of all Ireland, and the archbishop of Dublin primate of Ireland. The title of primate in England and Ireland confers no jurisdiction beyond that of archbishop. The name *primus* is applied in the Scottish Episcopal church to the presiding bishop. He is chosen by the bishops out of their own number, without their being bound to give effect to seniority of consecration or precedence of diocese.

PRIMATÉS, the name given by Linnæus to the first order of mammalia in his system, and which he placed first (whence the name, Lat. *primus*, first), because he ranked man amongst them, and accounted them highest in the scale of nature. He assigned as the characters of the order, incisor teeth in the front of the mouth, four in the upper jaw, in one row; mammae two, pectoral. In this order he placed four genera, *homo* (in which he included man and the orang-outang), *simia*, *lemur*, and *vespertilio*; corresponding to the *binaria* (man alone), *quadrumana*, and *cheiroptera* of Cuvier. That many of the primates of Linnæus really occupy a higher place in the scale of nature, either as to organization or intelligence, than many other mammalia, is more than doubtful.

PRIME (Lat. *prima*, the first—i.e., hour), the first of the so-called "lesser hours" of the Roman breviary (q.v.). It may be called the public morning-prayer of that church, and corresponds in substance with the morning service of the other ancient liturgies, allowance being made for Latin peculiarities. Prime commences with the beautiful hymn of Prudentius, *Jam lucis orto sidere*, which is followed by three and occasionally four psalms, the last portion of which consists of the opening verses of the 118th (in the authorized version, 119th) psalm, which is continued throughout the rest of the "lesser hours." Prime concludes with prayers appropriate to the beginning of a Christian's day.

PRIME, BENJAMIN YOUNG, 1733-91; b. Long Island, N. Y.; graduated at the college of New Jersey in 1751; took his medical degree at Leyden. He wrote essays in Hebrew, Greek, Latin, French, and Spanish, and many songs and ballads which were very popular during the revolutionary war. Among his publications are *The Patriot Muse, or Poems on Some of the Principal Events of the Late War*, by an American; *Columbia's Glory, or British Pride Humbled*; *A Poem on the American Revolution*; *Muscipula Cambryomachia*.

PRIME, EDWARD DORR GRIFFIN, b. N. Y., 1814; graduated at Union college in 1832, and at Princeton theological seminary in 1838; was pastor of a Presbyterian church at Scotchtown, N. Y., 1839-51; became associate editor of the *New York Observer* in 1853; chaplain at Rome in 1855; resumed his connection with the *Observer* in 1855, and became one of the proprietors in 1865. He traveled extensively 1869-70, and published on his return *Around the World: Sketches of Travel Through Many Lands and over Many Seas*. He is the author also of *Forty Years in the Turkish Empire, or Memoirs of the Rev. William Goodell, D.D., Missionary of the A. B. C. F. M.* He has written many letters under the signature of Eusebius.

PRIME, SAMUEL IRENÆUS, D.D., b. at Ballston, N. Y., 1812; graduated at Williams college, Mass., in 1829; studied theology at Princeton, N. J.; preached one year at Ballston and three years at Matteawan, N. Y., on the Hudson. In 1840 he became one of the editors and proprietors of the *New York Observer*, with which he is still connected. He has published numerous works, the most important of which are the following: *Travels in Europe and the East*, 2 vols.; *Letters from Switzerland*; *The Alhambra and the Kremlin*; *Life in New York*; *Annals of the English Bible*; *Thoughts on the Death of Little Children*; *The Power of Prayer*; *Five Years of Prayer*; *The Bible in the Levant*; *Memoirs of the Rev. Nicholas Murray, D.D.*; *Life of Samuel F. B. Morse*.

PRIME, WILLIAM COWPER, b. N. Y., 1825; graduated at the college of New Jersey in 1843; was admitted to the bar in New York, and practiced law until 1861, when he became proprietor and editor of the *Journal of Commerce*. He has published *The Owl Creek Letters*; *Boat-Life in Egypt and Nubia*; *Tent-Life in the Holy Land*; *Coins, Medals, and Seals, Ancient and Modern, Illustrated and Described*; *O Mother Dear, Jerusalem—The Old Hymn, its Origin and Genealogy*; an edition in fac-simile of Albert Durer's *Little Passion*.

PRIME-MOVER. A machine transforming apparent natural energy into visible work, and varied in form relatively to both. Man himself is the highest prime-mover and standard of natural construction. Next are the animals, greater muscular examples, foreshadowing the division of the translators of energy into classes, relating more to the work to be performed than to the energy to be transformed. While prime-movers are parallel in many points to the machines which they drive, they are almost alone in requiring a construction adapted to the driving-power; demanding a distinct region of scientific principles, and thus a "science of power" or "first motion." Exhausting a visible energy, they demand an economy, in per cent of work, from each "destruction;" thus, greater than machines, they become motors.

The sources of apparent energy in nature, made actual through prime-movers, are muscular energy, gravitation, and heat; the two latter respectively including falling water and atmospheric movements; electricity and magnetism. Although the heat-mover, or steam-engine, holds the first place, yet it was preceded in history by the united force of animals directed by men upon various objects; and by the windmill—to the prairie what the water-wheel is to the river—the oldest mechanical survivor of antiquity, claiming to add to the short list a fourth source of energy—horizontal velocity. After the windmill were the water-wheels, in many forms; then appeared the last of the "directly visible" powers; that preceded the heat-engine—Barker's mill, a rude form, giving power and prophesying the turbine. This gave control of the force of gravity, expressed in the vertical fall from level to level, of bodies of water; a force equivalent in foot-pounds to the product of the weight of the water multiplied by the feet of fall, equaling the energy increased continually to the point of shock on the water-wheel; where, intercepted in its force, it loses an energy equal to the work "attached" to the wheel; thus with light work losing most of the energy of the body of water. Even older than the wheel is the water-engine, a slow mover, in its construction forerunner of the steam-engine. The heat-engine, in the form of steam-engine used for propulsion, exerted an influence upon the stationary engine, that produced the turbine as a competitor against the wheel, grown obsolete, and against the new power, threatening to take the place of the waterfall. In turn, as special purposes sought special prime-movers, appeared hot-air, gas, and electro-dynamic engines; restricted in their applications, but in those superior; and again, in turn, we shall probably see electricity in various developments; then the applied force of the tides, great natural prime-movers, replacing the turbine in its first importance; then the sun's heat gathered and applied in tropical lands for the uses of a new civilization.

PRIMITIVE WESLEYANS originated in the excitement produced by the introduction of camp-meetings into England by Lorenzo Dow about 1807. William Clows, a Wesleyan local preacher, united in the services at these meetings, and Hugh Bourne, a layman of prominence, wrote a pamphlet in their defense, to which the preachers of several circuits replied. In 1807 the conference disclaimed connection with them; in 1808 expelled Bourne, and in 1810, Clows also. Both, however, continued their meetings and, in 1810, established the Primitive Methodist connection, retaining the doctrines and discipline of Wesleyan Methodism; striving to restore the original simple dress and manner of living; reviving Wesley's custom of "out-door preaching;" and licensing women to preach. Two-thirds of their annual conference are laymen. They have been very useful among the poor and neglected classes at home; and have established several missions abroad. In 1880 they reported, exclusive of Canada, 174,469 members; 1041 traveling preachers; 14,244 local preachers; 10,220 class leaders; 5,918 chapels and other preaching places; 3,884 Sunday-schools, containing 57,016 teachers, 363,336 scholars, and 7,772 catechumen members; church property valued at over \$10,000,000; and a theological school at Manchester.

PRIMOGENITURE is the rule of law under which the eldest son of the family succeeds to the father's real estate in preference to, and in absolute exclusion of, the younger sons and all the sisters. This is the rule adopted in Britain and in most European countries, though latterly the policy of the rule has been disputed, and the contrary example of France pointed to as an example or a warning, according to the theory advocated. The rule operates as follows: whenever a man dies intestate, leaving real estate—i.e., lands and houses—his eldest son is the only person entitled by law to the whole; and if the other brothers and sisters are not otherwise provided for out of the personality they are left destitute. If the eldest son is dead, but has left an eldest son, such grandson of the deceased, in like manner, succeeds to the whole lands exclusively, and so on, following in succession, the eldest sons of eldest sons, and their next eldest sons, one by one, in their order of seniority. But when the male line is exhausted, then females do not succeed in the same way singly and by seniority, but all together succeed jointly. Such is the rule in England and in Scotland. The preference of males to females was also the Jewish rule and the Greek rule, or at least that which prevailed at Athens; but it was unknown to the Romans. It is generally said our preference of males took its origin from the feudal system, by which the devolution of land depended on the personal ability of the party to perform military service. Our Danish ancestors seem not to have acknowledged any preference of the males, but the Saxons did so. Our law does not, like the Salic law, totally exclude females, but merely postpones them until the males

are exhausted. Though, however, it is the general law of England, as well as Scotland and Ireland, there is one county in England, that of Kent, where, by ancient custom—called gavelkind—a different rule prevails, and the land, instead of going wholly to the eldest son, is divided equally among all the sons. So there is an exception, called Borough English, in some boroughs and cities of England, where the land, instead of going to the eldest son, goes wholly to the youngest son. The evils said to be attendant on the law of primogeniture are alleged to be, that it often produces great hardship, by making one of the family enormously rich, and the others very poor, thereby introducing a sense of inequality and injustice among those who are apt to believe themselves equals by the law of nature. It also tends to encourage the accumulation of landed property in a few hands, and thereby cuts off the great mass of the people from the gratification of a natural desire and from one incentive to industry—viz., the acquisition of a portion of the soil. On the other hand, it is said that the cases of hardship in reality seldom occur, for, especially in modern times, an equal amount of personal property is often held by the same owners, and the rule does not apply to personality, which is equally divided among all the children. Moreover, the great land-owners seldom die intestate, but almost invariably provide for their younger children by means of charges or burdens on the family estate, and so counteract the effect of the law of primogeniture. The accumulation of landed property is said to be not an evil, but the contrary, for it enables agriculture to flourish, inasmuch as the larger the farms, the greater is the capital required, and the greater benefit to the land, and ultimately to the public. The law of primogeniture in England is not as it is or was in Scotland, stereotyped in its most odious form by the practice of entailing the lands, and so locking them up for generations in one family, secluding them from commerce, and of necessity preventing the successive heirs in possession from making improvements. The evils of the Scotch entail system have long been exposed, and led, in 1848, to a relaxation of the law, by which the practice of disentailing the property is made more easy and frequent. But in England, land cannot be locked up for a greater period than the lives of persons in existence, and for 21 years more, after which the parties entitled can sell or bring the lands into the market at their discretion; so that it is not correct to say that the accumulation of land in the great families is caused by the law of primogeniture, for practically each successive generation can do what it likes with the property, and squander it at will. It is only by the operation of the natural feelings of family pride that the family estates are kept together in a family. The mode in which this is practically done in England is as follows: the peer or head of the family being tenant for life, and the inheritance being entailed upon his eldest son, who is about to marry, the father and son take the proper steps (which they can always do jointly) for unsettling the estate, and obtaining the absolute dominion over it. They then proceed to resettle the estate, making the father as before tenant for life, then the son is reduced in his turn to a tenant for life also, after the father, instead of, as before, being tenant in tail, or full proprietor. Thus, the maintenance of the family dignity is secured for another generation by settling the inheritance on the eldest male issue of the intended marriage; and when the grandson attains the age of 21, or is about to marry, he and his father act in the same way toward the next generation. The English law of landed property has been said to answer admirably all the purposes to which it is applicable, for a testamentary power is given which stimulates industry, and encourages accumulation; and while capricious limitations, such as perpetual entails, are restrained, property is allowed to be molded according to the circumstances and wants of every family.

PRIMORSK, or LITTORAL PROVINCE, a division in e. Siberia, bounded by the Pacific ocean, the Okhotsk, Japan, Behring, and Polar seas and Behring strait; adjoining Mantchooria and Yakutsk; lying between 42° 20' and 70° n. lat., and 131° e. to 170° w. long.; 731,942 sq. m.; pop. '67, 43,320. The division is traversed in the n. by mountain ranges. The Amoor and the Anadyr are the chief rivers. The islands of Saghalien and the Russian Kuriles form part of the province, which belongs to the general division of e. Siberia as established in 1865. The government is by a governor, subordinate to the governor-general of the grand division, and by a council of regency. The inhabitants are of many races, including Russians, Japanese, Mantchoos, Kamtchadales, and others. Capital, Nikilayevsk, opposite Saghalien.

PRIMROSE, *Primula*, a genus of plants of the natural order *primulacea*, having a bell-shaped or tubular 5-toothed calyx, a salver-shaped corolla with five segments, five stamens, a globose germin containing many ovules, and a many-seeded capsule opening by five valves, and generally with ten teeth at the apex. The species are all herbaceous perennials, generally having only radical leaves; and the flowers in a simple umbel, more rarely with scapes bearing solitary flowers. Almost all of them are natives of Europe and the n. of Asia. Some of them are among the finest ornaments of our groves and meadows; some are found in mountainous regions. Their fine colors and soft, delicate beauty have led to the cultivation of some of them as garden flowers, probably from the very beginning of floriculture. The name primrose (Fr. *primrose*, Lat. *primula*) is derived from the Latin *primus*, first, and refers to the early appearance of the flowers of some of the most common species in spring.—The COMMON PRIMROSE (*P. vulgaris*), abundant in woods, hedgebanks, and pastures in Britain and in most parts of

Europe, has obovate-oblong, wrinkled leaves, and single-flowered scapes; the flowers about an inch broad, yellowish-white. This is the plant to which the English name primrose specially belongs. Akin to it is the cowslip (q.v.), or PAIGLE (*P. veris*), and perhaps still more nearly related is the OXSLIP (*P. elatior*), apparently wild in some parts of England, particularly in the eastern counties; but supposed by some botanists to be intermediate between the common primrose and the cowslip, which they therefore regard as extreme forms of one species.—The polyanthus (q.v.) is a cultivated variety of the cowslip.—The auricula (q.v.) (*P. auricula*), an Alpine species, is a favorite garden flower.—The BIRD'S-EYE PRIMROSE (*P. farinosa*) and the SCOTTISH PRIMROSE (*P. Scotica*) are both flowers of exquisite beauty, found in the northern parts of Britain; the latter chiefly on the coasts of Sutherland, Caithness, and the Orkney islands. The Alps and the Himalaya mountains produce several species. The CHINESE PRIMROSE (*P. Sinesis*) has for more than 40 years been very common in Britain, not only as a greenhouse but a window plant. It produces compound umbels of very numerous lilac or white flowers, which are displayed in autumn, winter, and spring.

PRIMULACEÆ, a natural order of exogenous plants, containing more than 200 known species, mostly natives of temperate and cold regions. They are all herbaceous, or scarcely half-shrubby, with leaves generally all radical, and no stipules. The calyx is generally 5-cleft, inferior or half-superior, regular, persistent; the corolla, with the limb divided into as many segments as the calyx, rarely wanting; the stamens inserted on the corolla, one opposite to each of its lobes; the ovary one-celled, the style solitary, the stigma capitate; the capsule with a central placenta and many seeds. Many of the primroses have flowers of much beauty, and some are very fragrant, as the primrose, cowslip, auricula, pimpernel, loosestrife, etc.

PRIMUM MOBILE. See PTOLEMAIC SYSTEM.

PRINCE (Lat. *princeps*, from *primus*, first, and *capio*, I take), an epithet which was originally applied to the *princeps senatus* of the Roman state, and afterward became a title of dignity. It was adopted by Augustus and his successors; hence the word was afterward applied to persons enjoying kingly power, more especially the rulers of small states, either sovereign, as in the case of the ancient princes of Wales, or dependent, like the rulers of certain states in Germany. The title is now very generally applied to the sons of kings and emperors, and persons of the blood-royal. In various parts of continental Europe, the title prince is borne by families of eminent rank, but not possessed of sovereignty; and in England a duke is, in strict heraldic language, entitled to be styled "high puissant and most noble prince," and a marquis or earl as "most noble and puissant prince." Practically, however, in Britain, the term prince is restricted to members of the royal family. The eldest son of the reigning sovereign is by a special patent created prince of Wales, and this is the only case in which the title prince is connected with a territorial distinction. In Germany, the ambiguity of applying the same title to the members of royal houses and princely families, not sovereign, is avoided, the former being styled "prinz," the latter "fürst." The German first takes rank below the duke (herzog). Most of the counts who had a seat in the old German diet were elevated to the dignity of prince on their acquiescence in the dismemberment of the German empire. In a more general acceptation, the term prince is often used for a sovereign or the ruler of a state.

PRINCE, a co. in n.w. Prince Edward's island, in the gulf of St. Lawrence, having the waters of Northumberland strait on the s. and w., forming Bedeque bay and Egmont bay on the s.w., and Tignish bay and Holland bay on the n.e.; 737 sq.m.; pop. '71, 28,302. It is intersected by the Prince Edward island railroad, terminating at Tignish bay. Its surface is undulating and well-timbered, with a fertile soil well cultivated. Lumber is extensively manufactured, and ship-building is carried on. Live stock are exported, also eggs, potatoes, and oysters. Within its limits are several islands known as agreeable summer resorts. Co. seat, Summerside.

PRINCE, THOMAS, 1687-1758; b. Mass.; graduated at Harvard college in 1707; traveled in Europe for several years; returned to America in 1717, and was ordained colleague of the rev. Dr. Sewall of the Old South church of Boston. He bequeathed to the Old South a valuable library, part of which was lost when the British soldiery had possession of the building, and of the remainder in the Boston public library a catalogue was made in 1868. Prince was distinguished for his learning and pulpit abilities. He published, besides many sermons, the following works: *An Account of the First Appearance of the Aurora Borealis; A Chronological History of New England in the Form of Annals; Account of the English Ministers on Martha's Vineyard; An Improvement of the Doctrine of Earthquakes, containing an Historical Summary of the most remarkable Earthquakes of New England; New England Psalmbook revised and improved.*

PRINCE EDWARD, a co. in s. Virginia, bounded by the Appomattox river, and the Nottaway river; traversed by the Richmond and Danville, and the Atlantic, Mississippi and Ohio railroads; about 325 sq.m.; pop. '80, 14,668-9,817 colored. The surface is uneven, and contains coal. The soil is fertile. The principal productions are corn, tobacco, wheat, and oats. Co. seat, Farmville.

PRINCE EDWARD, a co. in s. Ontario, consisting of a peninsula surrounded by lake Ontario, connected with the main-land in the n.w.; 374 sq.m.; pop. '71, 20,386. The lake forms among the islands on the n.e. which are included in the county several bays and inlets—Quinté bay in the n., and Prince Edward's bay in the s.e., and West Lake on the s.w. It has several important fishing stations, and manufactures of iron, plaster, steam-engines, and machinery; also breweries, potteries, tanneries, and lumber mills. Co. seat, Picton.

PRINCE EDWARD ISLAND, a province of the dominion of Canada, in the s. of the gulf of St. Lawrence, and separated from New Brunswick and Nova Scotia by the strait of Northumberland, lat. about 45° 56' to 47° 4' n., long. 62° to 64° 23' west. Length, 130 m.; breadth, 4 to 34 m.; area, 2,173 sq. miles. Pop. '41, 47,034; '48, 62,678; '71, 94,021. The surface is undulating; but few of the hills, the chief of which are in the middle of the island, and run from n. to s., are upward of 300 ft. in height. The coasts are girdled by a bold line of red sandstone cliffs, varying in height from 20 to 100 ft., and are indented with numerous bays and inlets, several of which, as Cardigan bay on the e., the entrance to Georgetown, and Hillsborough bay on the s., the entrance to Charlottetown (the capital of the colony), are deep and spacious, and afford safe anchorage for large vessels. Other inlets are Bedeque and Egmont bays on the s., and Holland, Richmond, and St. Peter's bays on the north. The rivers are mostly short. The soil, which is well watered with numerous springs and rivers, rests upon red sandstone, and consists for the most part of a layer of vegetable matter above a light loam, which rests upon stiff clay above sandstone. It is of great fertility, and the agricultural products are about double the quantity required for local consumption. Of the whole area, consisting of 1,360,000 acres, 1,300,000 acres are "good" land, and 60,000 acres are "poor" land; and in 1851 there were under cultivation 215,380 acres; in 1871, 1,097,860 acres. Since the year 1848 agriculture has become a much more important branch of industry. Between 1848 and 1861 the agricultural products had increased in many instances four-fold. In 1871 the amount of wheat produced was 269,392 bushels; of barley, 176,441 bushels; oats, 3,128,576 bushels; beans and peas, 1326 bushels; maize, 2,411 bushels; and potatoes, 3,375,726 bushels. In April, 1871, the live stock in the colony comprised 25,329 horses, 62,984 large cattle, 147,364 sheep and lambs, and 52,514 pigs. The soil and climate are admirably adapted for producing wheat, and all the cereals, fruits, and vegetables grow in temperate climes are produced here. The climate, milder than that of the continental regions in the vicinity, and free from the fogs which prevail on cape Breton and Nova Scotia, is very healthy. Prince Edward Island is extremely poor in minerals; copper and bog-iron ore are known to exist in small quantities. In the neighboring waters extensive and profitable fisheries are carried on. The fish caught are principally mackerel, salmon, alewives or gaspereaux (of the herring family), herrings, codfish, and hake. Manufactures are not important, though cloth is made to some small extent. The Prince Edward Island railway, 198 m. in length, was opened in 1875. It is constructed on a 3 ft. 6 in. gauge, and cost about £3,300 per mile. The value of total imports for 1873-74 amounted to £382,740; of the exports, to £144,426. The revenue of the colony for 1874 was £81,270; the expenditure, £88,780. The colonial government was vested in a lieutenant-governor, a house of assembly, a legislative council, and an executive council appointed by the lieutenant-governor. The legislature of Prince Edward Island declined to agree to the plan for a union of the British North American colonies which resulted from the negotiations begun in 1864; but at last, in 1873, this colony entered the confederation, and became one of the provinces of the dominion. Charlottetown, the provincial capital, had in 1871 a pop. of 8,807 (now 10,606). In 1878 Prince Edward Island possessed 342 vessels of 55,547 tons. There are in the province a college, a normal school, a model school, 18 grammar schools, and about 370 district schools. Tuition is free to all but the college, with the exception of a small fee for fuel. In 11 months ended Jan. 1, 1874, £11,838 was disbursed from the colonial treasury for public education. The island is divided into 3 counties—Prince, Queen's, and King's counties—of which the chief towns are respectively Summerside, Charlottetown, and Georgetown. All parts of the island are traversed by coach-roads; and the island has a telegraphic system, partly submarine. The railway crosses the island, connecting Charlottetown with Tignish on the n.w., and Georgetown and Souris on the s.e. The island was first taken possession of by the British in 1745, and was retaken by them, and finally annexed to their possessions in 1758.

PRINCE GEORGE, a co. in s.e. Virginia; drained by the James and Appomattox rivers, its n. and n.w. boundaries, and also by the Blackwater; traversed by the Atlantic, Mississippi and Ohio railroad; 280 sq.m.; pop. '80, 8,861—8,756 of American birth, 5,981 colored. The chief products are corn, wheat, oats, and pork. Co. seat, Prince George's Court-house.

PRINCE GEORGE'S, a co. in s. Maryland, drained by the Patuxent and Potomac rivers, the latter separating it from the District of Columbia on the w.; traversed by the Baltimore and Ohio and the Baltimore and Potomac railroads; 500 sq.m.; pop. '80, 26,263—25,705 of American birth; 12,313 colored. Tobacco, corn, and wheat are the chief products; the annual yield of tobacco is about 4,000,000 lbs. There are important shad and oyster fisheries. Iron ore is found. Co. seat, Upper Marlborough.

PRINCE OF WALES, the title borne by the eldest son of the sovereign of England. The native sovereigns of Wales were so designated in the days of Welsh independence; and on the conquest of Wales, the principality of Wales and earldom of Chester were bestowed by Henry III. on his son, afterward Edward I., but as an office of trust and government rather than as a title. It is traditionally related that Edward I. engaged to give the Welsh people a prince who would be born among them, and not know a word of English, and fulfilled the promise by bestowing the principality on his infant son, Edward, b. at Caernarvon castle. Edward, by the death of his elder brother, became heir-apparent. Edward III., his son, was never prince of Wales; but in 1343 he invested his son, Edward the black prince, with the principality, and from that time the title of prince of Wales has been borne by the eldest son of the reigning king. The title is, however, not inherited, and has usually been bestowed by patent and investiture, though in a few instances the heir to the throne has become prince of Wales simply by being so declared. The eldest son of the sovereign is by inheritance duke of Cornwall, a title first conferred in 1337 on Edward the black prince, on the death of his uncle, John of Eltham, the last earl of Cornwall, and held, according to the terms of the grant, by the first begotten son of the king. The title of earl of Chester, borne by Edward III. before his accession to the throne, has since been given along with the principality of Wales. That earldom was, by 21 Richard II. c. 9, erected into a principality; and it was enacted that it should be given in future to the king's eldest son—a precedent which has since been followed, although that statute, along with all others in the same parliament, was repealed by 1 Henry IV. c. 3. On the death of a prince of Wales in his father's lifetime, the title has been conferred on the sovereign's grandson, or next younger son, being heir-apparent. As heir of the crown of Scotland, the eldest son of the sovereign is prince and high steward of Scotland, duke of Rothesay, earl of Carrick, baron of Renfrew, and lord of the isles. The high office held by the house of Stewart (see STEWART, HOUSE OF) became merged in the crown when Robert II., the representative of the family, ascended the throne of Scotland in 1371. The earldom of Carrick was conferred by Robert II. on his eldest son. The dukedom of Rothesay was created by a solemn council held at Scone in 1398, and conferred on David, eldest son and heir of Robert III.; and when David, in 1402, fell a victim to the ambition of his uncle, it was transferred to his brother James, afterward James I. of Scotland. Renfrew was the chief patrimony of the stewards of Scotland, to whom it was granted by the sovereign in the 12th c., their principal residence having been in the burgh of Renfrew. In 1404 king Robert III. granted the barony of Renfrew and other portions of the estates of the stewards to his son and heir, James, since which time the eldest son of the sovereign has borne the title of baron of Renfrew. By act of the Scottish parliament of 1469, the titles of prince and high steward of Scotland, duke of Rothesay, earl of Carrick, baron of Renfrew, and lord of the isles were vested in the eldest son and heir-apparent of the crown of Scotland forever. The present prince of Wales was created earl of Dublin on Sep. 10, 1849, that dignity being destined to him and his heirs, kings of the United Kingdom of Great Britain and Ireland, forever.

An annuity of £40,000 was settled on the prince of Wales by 26 Vict. c. 1. He has besides the revenues of the duchy of Cornwall. These amounted previously to 1840 to between £11,000 and £16,000; since that period they have greatly risen, amounting in 1876 to £99,827. Only a small part of this income has been expended since the birth of the present prince of Wales. The sum paid over to the present prince of Wales in 1869 was £55,252; and in 1876, £70,375. An income of \$10,000 has been settled by parliament on the princess of Wales, to be raised to £30,000 in the event of her widowhood. The annuities of the prince and princess of Wales are charged on the consolidated fund.

The prince of Wales has a separate household, as also has the princess of Wales. Act 35, Geo. III. c. 125 makes provision to prevent the accumulation of debt by any future heir-apparent to the crown, and enacts that as soon as he shall have a separate establishment, the treasurer or principal officer shall make a plan of such establishment in distinct departments and classes, with the salaries and payments of each class, and of each individual officer; and the treasurer is made responsible for the punctuality of all payments, and required to submit his accounts to the lords of the treasury. The statute of treasons, 25 Edw. III. makes it treason to compass the death of the prince of Wales, or violate the chastity of his consort.

By a statute of the order of the garter, of date 1805, the prince of Wales becomes a knight of the Garter as soon as he receives that title.

In 1788, on the illness of George III., it was made a question whether the prince of Wales was not, as heir-apparent, entitled to the regency; the recovery of the king prevented the necessity for a decision, but it is now held that he has no such right.

The arms of the prince of Wales are those of the sovereign, differenced by a label of three points argent, and the present prince of Wales bears *en surtout* the escutcheon of the house of Saxony. The supporters and crest are the same as those of royalty. The ancient coronet of the princes of Wales was a circle of gold set round with four crosses patée, and as many fleurs-de-lis alternately. Since the restoration, it has been closed with one arch only, adorned with pearls, surmounted by a mound and cross, and furnished with a cap trimmed with ermine, like that of the sovereign. The prince of

Wales has further a distinguishing badge, composed of a plume of three white ostrich feathers, encircled by an ancient coronet of a prince of Wales, and accompanied by the motto "Ich dien" (I serve). This device is said by a tradition, on which considerable doubts have been thrown, to have been first assumed by the Black prince after the battle of Crécy, in 1346, when he took such a plume from John, king of Bohemia, whom he had slain with his own hand. The motto has been supposed to allude to the fact that the king of Bohemia served, or was stipendiary to the French king in his wars.

PRINCE OF WALES ISLAND, or PU'LO PINANG' (Betel Nut island), an important British possession, and one of the straits settlements (q. v.), lies at the mouth of the strait of Malacca, near the w. coast of the Malay peninsula, in lat. $5^{\circ} 16'$ — $5^{\circ} 30'$ n., and long. $100^{\circ} 9'$ — $100^{\circ} 25'$ east. Length $13\frac{1}{2}$ m.; breadth, 5 to 10 m.; area, 106 sq. miles. A belt of cocoa-nut and lofty areca palms runs along the coast. A slip of low land, interspersed with hills, stretches along the e. side of the island, where rice, pepper, betel, fruits, provisions, etc., are planted on the level parts; nutmeg and clove-trees on the heights. This district is watered by numerous streams, cut by well-kept roads, and dotted with villas and gardens. Sugar, coffee, and pepper plantations are on the s. and s.w. coasts; thence rises a wooded mountain ridge, which increases in elevation toward the n., where, at the sanitarium bungalows of Strawberry hill, it attains a height of 2,922 feet. The rocks are granite and mica schist; the soil, a rich vegetable mold.

The climate of Prince of Wales island is healthy, a sea-breeze blowing every day, and rain falling during all the months of the year, except January and February. In the low lands, the thermometer ranges from 80° to 90° , and at Strawberry hill, from 62° to 75° , affording a pleasant change within a few miles of Georgetown. From the sanitarium, a splendid view is obtained of the plantations, town, shipping, and the lofty hills of Queda.

The products are timber, pepper, sugar, nutmegs, cloves, coffee, cocoa, and areca nuts, ginger, sweet potatoes, rice, etc.; and the pineapple, shaddock, plantain, banana, orange, lemon, mango, guava, etc., abound. The attempt to grow cotton has proved a failure. Tin ore is found at the base of the mountains. The imports may be valued at about £1,600,000; the exports at £2,000,000. European and American manufactures, and a share of the produce of the eastern Archipelago, China, India, Siam, and Burmah, enter the emporium of Prince of Wales island on their way to suitable markets.

Georgetown, the capital, is situated at the n.e. extremity of the island, and is defended by fort Cornwallis. The governor's house and the hospital are at some distance from the town, which is the seat of government for the Eastern straits settlements, including Malacca and Singapore. On the peninsula opposite lies the province of Wellesley, a strip of country 35 m. in length by 4 to 11 m. in breadth. The population of Prince of Wales island, in 1871, was 61,797, and along with that of the province of Wellesley, 133,230; of whom the greater number are Malays, many are Chinese, 400 or 500 are Europeans and their descendants, the remainder being Siamese, Burmans, Bengalese, etc.

Toward the end of last century, a capt. F. Light married the daughter of the king of Queda, from whom he received the gift of Prince of Wales island; but in 1786 it was handed over to the East India company, who retained capt. Light as superintendent, and paid the king \$6,000 annually. By an arrangement to pay an additional \$4,000 yearly, the province of Wellesley was afterward ceded to the company. Population rapidly increased, the forests were cleared for plantations, and a large trade sprang up. It has been nearly stationary for several years, except in agriculture, owing to the more favorable situation of Singapore for the general commerce of these seas.

PRINCEPS SENATUS, an officer of the Roman senate, who, under the monarchy, was a royal appointee for life, *custos urbis*, and had precedence among the *decemviri*. Under the republic he was the appointee of the curies. B.C. 487, the *patres minorum gentium*, previously ineligible, were made eligible, and afterward the senior ex-censor held the office *ex officio*. Later, any senator was eligible, but the office was simply honorary, and did not carry with it the presidency of the senate. Finally the title belonged to the emperor.

PRINCE RUPERT'S DROPS. These scientific toys, so called from prince Rupert (see RUPERT), their inventor, are simply drops of glass thrown, when melted, into water, and thus suddenly consolidated. They have usually a form somewhat resembling a tadpole. The thick end may be subjected to smart hammering on an anvil without its breaking; but if the smallest fragment of the tail be nipped off, the whole flies into fine dust with almost explosive violence. The phenomenon is due to the state of strain in the interior of the mass of glass, caused by the sudden consolidation of the crust. The crust is formed while the internal mass is still liquid. This tends to contract on cooling, but is prevented by the molecular forces which attach it to the crust. It is, therefore, somewhat in the state of the dog-head of a gun on full-cock, which will stand a smart blow without falling; while a slight touch applied to the trigger allows the spring to act. Another example of the same state of constraint is the Bologna phial—a glass cup with its sides thin, but the bottom very thick. It also is cooled as quickly as possible. A bullet may be dropped into it with safety from a considerable height; but if a small

sharp-edged fragment of flint be dropped in, so as to scratch the surface in the slightest degree, the molecular forces are set free, and the whole falls to pieces.

PRINCE'S FEATHER. See **AMARANTH**, *ante*.

PRINCE METAL. See **TIN**.

PRINCESS ANNE, a co. in s.e. Virginia, bounded on the n. by Chesapeake bay, on the e. by the Atlantic ocean; about 350 sq.m.; pop. '80, 9,394—9,361 of American birth, 4,265 colored. The surface is level and heavily timbered. The soil is fertile. The principal productions are corn, cattle, and lumber. Co. seat, Princess Anne Court-House.

PRINCETON, a t., the co. seat of Bureau co. Ill., on the Chicago, Burlington and Quincy railroad; 105 m. w.s.w of Chicago; pop. '70, 6,500. It has churches, schools, 3 banks, 3 newspapers, a court-house, and several manufactories. It is one of the earliest settled towns in the state, and has always had the repute of being a place of social culture and a pleasant residence.

PRINCETON, a t. and township of New Jersey, on a branch of the Pennsylvania railway, 40 m. n.e. of Philadelphia. It is pleasantly situated, and contains many elegant residences; has a bank, a weekly newspaper, and several churches. The pop. of Princeton in 1870 was 3,986. On Jan. 3, 1777, it was the scene of a battle between the British under col. Mawhood, and the Americans under Washington, in which the former were defeated. Princeton, however, is chiefly celebrated as the seat of the college of New Jersey, popularly known as Princeton college, founded by charter in 1746, under the auspices of the Presbyterian synod of New York, and transferred from Newark to Princeton in 1757, on the erection of a hall named Nassau hall in honor of William III. The college of New Jersey has had several distinguished Presbyterian divines for its presidents, as Jonathan Edwards, Aaron Burr, and Dr. McCosh. In 1874-75 it had 14 professors, 6 instructors, and 408 students. The theological seminary, founded in 1812, has 6 professors, 1 tutor, and 116 students. With the Princeton theological school is associated the fame of the *Biblical Repository and Princeton Review*, founded in 1825, and for many years edited by Dr. Hodge, professor in the theological seminary. The *Princeton Review* is now, however, edited in New York.

PRINCETON, BATTLE OF, Jan. 3, 1777. Cornwallis, with nearly his whole force, came up from Princeton to Trenton, where the American army was stationed, Jan. 2, and took up his position on the w. bank of the Assanpink, a little fordable stream, the bridge across which was commanded by the Americans. Washington, whose army was inferior in every way to that of the enemy, and whose retreat was impossible on account of the ice in the Delaware, resolved to attack the remaining British force at Princeton, capture the arms and stores at that point, and seize the British magazines at Brunswick afterward. Washington came to the bridge on Stony Brook, about 3 m. from Princeton, at sunrise, sent on gen. Mercer to take possession of the bridge on the main road to Princeton, and went himself by a shorter way. Meanwhile he had kept the enemy in ignorance of his movements; his baggage had been carried to Burlington, and a force had been left at the Assanpink to deceive the enemy with a show of defense, but with orders to join the main body of the army at dawn. The British force at Princeton, on their way to Trenton, encountered Mercer's brigade at the bridge. Both detachments endeavored to take possession of the same position on a piece of rising ground, which the Americans succeeded in occupying first. The Americans began a vigorous fire upon the British, who soon made a bayonet charge, and drove them from their position. During the fight, gen. Mercer was mortally wounded. The British pursued the Americans, but were soon stopped by a force of Pennsylvania militia under Washington, and a body of American regulars. The British began an artillery fire on this force, and made a determined attempt to capture two pieces of artillery from the militia; and after a fierce struggle, by another bayonet charge, succeeded in reaching the main road, and started toward Trenton, leaving two field-pieces on the field. The 55th British was put to flight, and went in the direction of Brunswick. The 40th did not arrive in time to take part in the battle; part found shelter in Nassau hall at the college of New Jersey, part retreated to Brunswick. The few who did not escape when the Americans came up, surrendered after exchanging a few shots. Washington marched to Morristown. The British loss was nearly 200 killed and wounded, and 230 prisoners. The American loss was about 37.

PRINCETON COLLEGE. See **NEW JERSEY, COLLEGE OF**.

PRINCE WILLIAM, a co. in n.e. Virginia, drained by the Potomac on the s.e., and by Bull run and Occoquan river, and traversed by the Virginia Midland railroad; 360 sq.m.; pop. '80, 9,180—8,954 of American birth, 2,601 colored. The surface is hilly; corn, wheat, oats, and pork are the staples. Co. seat, Brentsville.

PRINCIPAL, the name given to an important stop of the organ. It is sometimes termed the octave stop, because it is tuned one octave above the diapasens. It stands midway in pitch between the diapasens and the fifteenth; and in tuning an organ it is, owing to its clearness of tone, the best stop to commence with for the adjustment of other stops: probably from this fact it derives its name.

PRINCIPAL AND ACCESSORY. See **ACCESSARY.**

PRINCIPAL AND AGENT. The law of principal and agent is founded on the absolute necessity of having some one to act for another in times and places when the latter is not personally present, and this necessity pervades nearly all branches of the law; and as a general rule, the act of the agent is just as binding on the principal, and produces the same effect, as regards his liability, as if the principal had acted in person. Agents are divided into many classes; indeed, nobody can escape, in one capacity or another, being occasionally the agent of somebody else. Attorneys, solicitors, advocates, brokers, auctioneers, etc., may be said to make a business of agency. A wife is, in law, for many purposes of household management, the agent of the husband, and so are the children. Mercantile agents are generally called factors or brokers. The contract between principal and agent implies that the agent shall keep within the limits of his commission, and that the principal will ratify and accept all his contracts, and relieve him of his liabilities. The remuneration of the agent is generally called his commission. As the agent binds his principal, it follows that the principal can be sued by third parties who deal with the agent. The nice distinction that exists in the law on this subject as to the mutual rights and liabilities of the parties are too numerous to be here noticed.

PRINCIPAL AND SURETY. See **SURETY.**

PRINCIPATO, CITRA and ULTRA, formerly the name of two provinces of the kingdom of Naples. *Principato Citra*, now forming the province of Salerno in the reorganized kingdom of Italy, is a maritime province, bounded on the s.w. by the Mediterranean, and on the n. by the province of *Principato Ultra*, now called Avellino. The united area of the two provinces is 3,405 sq. m.; pop. '71, 917,429. Principal towns in Principato Citra are Salerno (from which it derives its present name), Sarno, and Pagani; in Principato Ultra, Avellino (from which it takes its present name), Ariano, and Cervinara.

PRINGLE, THOMAS, 1789-1834; b. at Blaiklaw, Scotland; educated at the university of Edinburgh. While a clerk in the register's office he published a poem entitled *The Autumnal Excursion*. Abandoning his clerkship in 1817, he devoted himself to literary pursuits, and commenced the *Edinburgh Magazine*, which was soon changed to *Blackwood's Magazine*. At the same time he edited the *Edinburgh Star* newspaper, and *Constable's Magazine*, and published a volume entitled *The Excursion and other Poems*. In 1820 he went with his brothers, who were farmers, and 23 others to South Africa, and became government librarian at Cape Town. He endeavored to eke out his income by establishing an academy, started the *South African Journal*, and edited the *South African Commercial Advertiser*. The intolerance of the governor compelled him to discontinue these, and in 1826 he returned to England, where in 1827 he became secretary to the anti-slavery society, holding the office until the abolition of slavery in the West Indies in 1834. His published works are *Some Account of English Settlers in Albany, South Africa; Ephemerides, or Occasional Poems; Terioldale and other Poems; African Sketches; Narrative of a Residence in South Africa*. An edition of his *Poetical Works*, with a sketch of his life, by Leitch Ritchie, appeared in 1838.

PRINGSHEIM, NATHANAEL, b. Landsburg, Silesia, 1823; studied botany in Paris and went to Berlin in 1851. In 1854 he published *Grundlinien einer Theorie der Pflanzenzelle*; 1855, *Ueber die Befruchtung und Keimung der Algen und das Wesen des Zeugungsactes*. In 1857 he began the publication of the *Jahrbücher für Wissenschaftliche Botanik*. In 1864-68 was professor at the university of Jena. He is the author of several important works; among them are *Ueber die Befruchtung und Keimung der Algen und das Wesen des Zeugungsactes*, in 1855, and *Grundlinien einer Theorie der Pflanzenzelle*, 1854. He is distinguished for valuable researches regarding cryptogamous plants.

PRINTERS, LAW AS TO. There were various restrictions on the sale and use of printing-presses, which had been imposed in consequence of the extended and secret influence often exercised by them; and the law of treason and libel is intimately associated with the press. By an act of 32 and 33 Vict. c. 24, which altered several older acts passed in the reign of George III. for suppressing seditious and treasonable practices, reciting the mischief produced by the publication of irreligious, treasonable, and seditious libels, and the difficulty of tracing them, it is now law that every person having a printing-press, or types for printing, shall give notice thereof to the clerk of the peace where the same is intended to be used, and shall obtain a certificate of registration, otherwise he is liable to a penalty of £20. And the queen's printers for England and Scotland, and the university presses of Oxford and Cambridge, were exempt. No letter-founders and makers of types need register themselves under a like penalty, and need not keep an account of all the persons to whom types and presses are sold, which account may be inspected by a justice of the peace. But printers must keep a copy of every paper they print for hire or reward, and shall indorse thereon the name of the person employing them to do so, under a penalty of £20. Every printer who shall print a book or paper without having the printer's name and address on the first or last leaf thereof, shall, by the act 32 and 33 Vict. c. 24, forfeit £5 for every copy printed; but the only person who can sue for or enforce this penalty is the attorney or solicitor general of England, or the lord-advocate of Scotland. And any proceedings to enforce the statutes in the name of other persons are absolutely void. The law is thus changed that a printer

cannot recover his expenses for labor and materials in printing a work, unless he has complied with the statutory requirements. On a recent occasion, in which a printer in England who sued for his account was met with a defense founded on these statutes, it was discovered by the London printers that few of them had registered themselves: and such law is now repealed altogether. With regard to the printing trade, many customs prevail which do not differ in point of law from the customs affecting other trades, it being the rule that customs of a peculiar trade are binding unless specially excluded. As to obscene prints, see OBSCENE.

PRINTING is the art of producing impressions from characters or figures, on paper or any other substance. There are several distinct branches of this important art—as the printing of books with movable types, the printing of engraved copper and steel plates (see ENGRAVING), and the taking of impressions from stone, called lithography (q.v.). We have now to describe the art of printing books or sheets with movable types, generally called *letter-press printing*, and which may undoubtedly be esteemed the greatest of all human inventions.

The art of printing is of comparatively modern origin, only 400 years having elapsed since the first book was issued from the press; yet we have proofs that the principles upon which it was ultimately developed existed among the ancient Assyrian nations. Entire and undecayed bricks of the famed city and tower of Babylon have been found stamped with various symbolical figures and hieroglyphic characters. In this, however, as in every similar relic of antiquity, the object which stamped the figures was in one block or piece, and therefore could be employed only for one distinct subject. This, though a kind of printing, was totally useless for the propagation of literature, on account both of its expensiveness and tediousness. The Chinese are the only existing people who still pursue this rude mode of printing by stamping paper with blocks of wood. The work which they intend to be printed is, in the first place, carefully written upon sheets of thin transparent paper; each of these sheets is glued, with the face downward, upon a thin tablet of hard wood; and the engraver then, with proper instruments, cuts away the wood in all those parts on which nothing is traced; thus leaving the transcribed characters in *relief*, and ready for printing. In this way, as many tablets are necessary as there are written pages. No press is used; but when the ink is laid on, and the paper carefully placed above it, a brush is passed over with the proper degree of pressure. A similar kind of printing by blocks, for the production of playing-cards and rude pictures of scriptural subjects, was in use in Europe toward the end of the 14th century. But in all this there was little merit. The great discovery was that of forming every letter or character of the alphabet separately, so as to be capable of rearrangement, and forming in succession the pages of a work, thereby avoiding the interminable labor of cutting new blocks of types for every page. The credit of discovering this simple yet marvelous art is contested by the Dutch in favor of Laurence Coster (q.v.), between 1420 and 1426; and by the Germans, on behalf of Johann Gänzfleisch of the Gutenberg (q.v.) family, about 1438. In all probability, the discovery was made almost simultaneously—such a theory being consistent with the general social progress at the period, and the secrecy which both inventors at first maintained respecting their art. The types first employed were of wood; but soon the practice of casting them in metal was introduced. See TYPES. The earliest of these metal types resembled the black letter in use by transcribers, and one great aim of the first printers was to produce books which should closely resemble the works in manuscript hitherto in use. Between 1450 and 1455 Gutenberg succeeded in printing a Bible, copies of which are now exceedingly rare and valuable. It is in quarto size, double columns, the initial letters of the chapters being executed with the pen, in colors. Besides this Bible, some other specimens of the work of Gutenberg, the produce of his press at Mayence, have been discovered. The Dutch at Haarlem preserve and show with reverential care similar specimens of early printing by Coster. Mayence, Strasburg, and Haarlem were indisputably the places where printing was executed before the art was extended to Rome, Venice, Florence, Milan, Paris, Tours, and other continental cities. Previous to 1471 it had reached these and various other places; and about the same year Caxton (q.v.) introduced the art into England by setting up a press in Westminster abbey.

Printing was introduced into Scotland about 30 years after Caxton had brought it to England; in 1551 it reached Dublin, and to other quarters it found its way very slowly. While coming into notice, its progress had been interrupted by the broils consequent on the reformation; and soon afterward it was retarded by the civil war in Great Britain. Even the restoration acted detrimentally, for it led to an act of parliament which prevented more than 20 printers carrying on their art in England. Printing, in short, has in almost every country been an ill-used art; and is still in various countries practiced under fiscal restrictions. In Germany and Holland, where it originated, it has, on account of sundry obstructions, gained little way—the work produced at Mayence and Haarlem being, for example, still of a very inferior kind; while, in recent times, in England and the United States, the art has attained to extraordinary proficiency. Printing is now conducted in all the British colonial possessions; but in few is the work of a superior character—the best perhaps being that produced at Melbourne in Victoria.

Retarded by the jealousy of governments, printing for some ages derived little advan-

tage from mechanical ingenuity. Originating at the middle of the 15th, the art continued

FIG. 1.—Old Common Press.

to be conducted until the middle of the 17th c. in a very clumsy manner. The press resembled a screw-press, with a contrivance for running the form of types under the point of pressure; force having been thus applied, the screw was relaxed, and the form withdrawn with the impression executed on the paper. The defects of this very rude mechanism were at length partially remedied by an ingenious Dutch mechanic, Willem Jansen Blacu, who carried on the business of a mathematical instrument-maker at Amsterdam. He contrived a press, in which the carriage holding the form was wound below the point of pressure, which was given by moving a handle attached to a screw hanging in a beam having a spring,

which spring caused the screw to fly back as soon as the impression was given. This species of press, which was almost entirely formed of wood, continued in general use in every country in Europe till the beginning of the present century. With certain lever powers attached to the screw and handle, it is represented above. In connection with this representation of the old common press, the process of printing may be described. The form, being laid on the sole of the press (*s*), is fixed at the sides, so as to render it immovable from its position. There are two men employed; one puts ink on the form, either by means of stuffed balls or by a composition-roller, and the other works the press. The latter lifts a blank sheet from a table at his side, and places it on what is called the *tympan* (*t*), which is composed of parchment and blanket-stuff, fitted in a frame, and tightened like the top of a drum—and hence its name—and which, by means of hinges connecting it with the sole, folds down like a lid over the form. As the sheet, however, would fall off in the act of being brought down, a skeleton-like slender frame, called a *frisket* (*f*), is hinged to the upper extremity of the tympan, over which it is brought to hold on the paper. Thus, the frisket being first folded down over the tympan, and the tympan next folded down over the form, the impression is ready to be taken. This is done by the left hand of the pressman winding the carriage below the *platten* (*p*), or pressing surface, and the impression is performed by the right hand pulling the handle attached to the screw mechanism. The carriage is then wound back, the printed sheet lifted off, and another put on the tympan, the form again inked, and so on successively. In the above engraving, the press appears with the frisket and tympan sloping upward, ready to receive the sheet, the frisket being sustained from falling backward by a slip of wood depending from the ceiling. One of the greatest niceties connected with this art is the printing of the sheet on the second side in such a manner that each page, nay, each line, shall fall exactly on the corresponding page and line on the side first printed. To produce this desirable effect, two iron points are fixed in the middle of the sides of the frame of the tympan, which make two small holes in the sheet during the first pressure. When the sheet is laid on to receive an impression from the second form, these holes are placed on the same points, so as to cause the two impressions to correspond. This is termed producing *register*; and unless good register is effected, the printing has a very indifferent appearance. However improved, a press of the above description could not impress more than half a sheet; and the practice was to first squeeze so much of the sheet, then relax the handle, wind the second half below the platten, and print it in turn. Thus, each sheet required four squeezes to complete it—two on each side. It is not without a degree of wonder that one reflects on the rudimentary clumsiness of the whole operation; and it seems not less marvelous, that it was by no other process that the best typography could be produced until the conclusion of the 18th century.

The first improvement upon the printing-press was made by the celebrated earl of Stanhope. He constructed the press of iron, and that of a size sufficient to print the whole surface of a sheet, and he applied such a combined action of levers to the screw as to make the pull a great deal less laborious to the pressman, the mechanism altogether being such as to permit much more rapid and efficient working. A multitude of improvements speedily succeeded that of earl Stanhope, in most of which the screw was dismissed, the pressure being generally effected by levers, or by the simple and efficient principle of straightening a joint. Among those which have gained a large share of approbation may be mentioned the *Columbian press*, which is of American invention. This press was brought to Great Britain in 1818 by Mr. George Clymer of Philadelphia, and patented. The pressing-power in this instance is procured by a long bar or handle acting upon a combination of exceedingly powerful levers above the platten, the return of the handle or levers being effected by means of counterpoises or weights. For ease and facility of *pull*, this press is preferred by most workmen; and certainly the powerful

command which the leverage enables the workman to exercise, is favorable to delicacy and exactness of printing—his arm feeling, as it were, through the series of levers to the very face of the types. In the present day, the old wooden press of Blaeu is entirely discarded from use.

To secure good printing, the following points are essential: 1. The types, carefully set, fixed with precision in forms, rendered level all over, so that all parts may be pressed alike, and the whole properly cleaned by a wash of potash lye. 2. A uniform inking of the surface, to give uniformity of color. 3. The paper damped equably, neither too much nor too little, so as to take an impression easily and evenly. 4. An equable, firm, and smart pressure, and with that degree of steadiness in the mechanism that the sheet shall touch and leave the types without shaking and blurring. 5. Care in adjusting the pointers (or gauge), so that perfect register may be secured in printing the second side. 6. Such frequency in changing *fly* or under-sheets on the tympan, that the first side shall not get dirtied by off-setting when printing the second side. 7. The laying of small patches on the tympan, where, from any inequality, it seems necessary to bring up the pressing surface to a thorough equality. A regard to all these circumstances constitutes the duty of a pressman. Bad printing is usually a result of old and worn types, want of proper cleaning, and an inferior kind of ink.

Printing by hand-presses of an improved kind continues to be used in the case of limited impressions, or where extra care and elegance in typography are required; also where machinery is unattainable; but in general circumstances, and more particularly to meet the demand for popular reading, printing is now executed by one or other of the varieties of cylinder-presses, moved by steam-power. Attempts have indeed been made to introduce flat-pressure machines, by which as many as 700 sides can be printed per hour; but these, though possessing the advantage of superseding severe bodily labor, and demanding only the services of a boy to lay on, and another to take off the sheets, have never become common. More success, as regards flat-pressure machines, has been attained in the United States, where much fine work is provided by a clever adaptation of this kind, particularly in New York, Boston, and Philadelphia. No flat pressure, however, can compete, in point of speed, with the pressure which is communicated by revolving iron cylinders.

Cylinder-printing is the great modern fact in the history of the art, progress in which department has been facilitated by the invention of inking rollers made of a certain composition, to supersede the old process of inking by stuffed balls (see ROLLERS). In 1790, Mr. Nicholson, the editor of the *Philosophical Journal*, procured a patent for certain improvements in printing, which patent embodies almost every principle since so successfully applied to printing-machines; and although he did not carry his views into practical effect, little has been left for subsequent engineers to do, but to apply, in the most judicious manner, the principles he laid down in his patent. Whether Mr. Nicholson's ideas were known to Mr. König, a German, is now uncertain; but to him is due the distinguished merit of carrying steam-printing first into effect. Arriving in London about 1804, he first projected improvements on the common press; but, after a while, he turned his attention to cylinder-printing. The first result of his experiments was a small machine, in which the two leading features of Nicholson's invention were embraced (the cylinders and the inking-rollers), which he exhibited to Mr. Walter, proprietor of the *Times* newspaper; and on showing what further improvements were contemplated, an agreement was entered into for the erection of two machines for printing that journal. Accordingly, on Nov. 28, 1814, the public were apprised that the number of the *Times* of that date was the first ever printed by machinery, steam-propelled. At this period, but few persons knew of any attempts going on for the attainment of this object; whilst among those connected with printing, it had often been talked of, but treated as chimerical.

After the utility of cylindrical printing had been thus proved, it was thought highly desirable that the principle should be applied to printing fine book-work, where accurate register is indispensable. This was, to a certain extent, attained by using two large cylinders, the sheet of paper being conveyed from the bottom of the first cylinder (where it had received the first impression) by means of tapes, leading in a diagonal direction to the top of the second cylinder, round which the sheet was carried till the second side was printed. The first machine of this description was erected at Mr. Bensley's office, where it continued at work for some years, till more modern machines superseded it.

In the course of 1818 Messrs. Applegath and Cowper took out a patent for improvements in cylindrical printing-machinery. The chief improvements were the application of two drums placed between the cylinders to insure accuracy in the register, over and under which the sheet was conveyed in its progress from one cylinder to the other, instead of being carried, as in König's machine, in a straight line from the one cylinder to the other; and the mode of distributing the ink upon tables instead of rollers—two principles which have secured to machines of this construction a decided preference for fine work. Machines of this construction were made by Applegath and Cowper for the principal printing establishments in London, Paris, Edinburgh, and many other cities; and it is nearly upon the model of their machines that other manufacturers now construct their steam-presses for the execution of ordinary book-work. Printing-machines may be

divided into two distinct classes—those for printing book-work, in which register is required, and those for printing newspapers, in which register is not sought for, and speed is of first consequence.

Applegath and Cowper's book-machine, as just mentioned, remains the best of its kind. The machine, moved by steam-power, from which the annexed engraving is taken, is one of this description. It is about 15 ft. long by 5 broad, and consists of a very strong cast-iron frame-work, secured together by two ends and several cross-bars. To

FIG. 2.—Book Machine.

further be observed that a boy, marked *a* in the cut, is standing on the top of some steps feeding in sheets of paper, each of which, on being delivered, is swept round the first cylinder *b* (being held on by tapes), gets its impression below from the types, is carried over and betwixt the drums above, and then brought round on the second cylinder *c*; now it gets its second side printed, and issuing into the space between the cylinders, is seized by the boy *d*, who lays it on a table completely printed. The whole operation is accompanied with a loud noise, from the revolving of the cylinders, the working of the notched wheels, and the driving of the table to and fro by a rack beneath, but without any strain on the mechanism, or risk of injury to the attendants. On minutely examining the parts, we observe that at each end there is an apparatus of rollers taking ink from a ductor or reservoir of that material, and placing it upon a portion of the moving table beneath; here other rollers distribute it, while others take it off and roll it upon the pages of types, ready for each impression.

The two printing-cylinders are nearly nine feet in circumference each, and are placed about two feet apart. They are accurately turned, so that the surfaces of the type-carriages and the cylinders may be perfectly parallel. The axis of each cylinder works in brass bearings in the upright frame-work, where, by means of screws, the degree of pressure with which the cylinders are allowed to rest upon the types may be regulated to any degree of nicety.

The cylinders have a continuous rotary motion toward each other, given by two large toothed wheels, whilst the type-carriages move backward and forward under them. The movements are so contrived that the type-carriages shall have gone and returned to the same point during the period that the cylinders have made one entire revolution; consequently, each successive impression is taken from the types by the same part of each cylinder. The two drums placed between the cylinders are for the purpose of causing the sheet of paper to pass smoothly and accurately from one printing cylinder to the other. To preserve the sheet in its proper place on the cylinders, and carry it forward through the different parts of its journey from the hand of the one boy to that of the other, there is an extensive apparatus of tapes, some of which are observable in the cut. These tapes are half an inch broad, and are formed into a series of endless bands, arranged at certain distances apart, so as to fall into the interstices and margins of the forms, and therefore escape being crushed between the types and the cylinders. The machine may be stopped at any instant by turning the handle of a lever. Such is the form of the machine that has printed the present work.

Many modified varieties of the cylinder machine have been introduced; the most important of them is the *gripper*. In this machine the types are laid on a traveling table like that described above; the cylinder which gives the pressure is reduced to 12 or 18 inches in diameter, the drums are dispensed with, and the tapes are replaced by a contrivance called a gripper. This consists of a series of brass grips like fingers arranged along, and fixed to the cylinder; these seize the sheet at the proper moment, and retain it till it is delivered printed. The single gripper is supplied with points for registering. In the double or perfecting variety, the sheet is delivered from the first cylinder into the grippers of the second. There are many varieties of gripper machines; the most popular are the Wharfedale, a single, and the double gripper, named after its maker, M. Marioni of Paris. They produce good work, and are well adapted for general purposes.

Non-registering machines for rapid printing are of various kinds, according to the degree of speed which is demanded. In those first introduced, the principle was that of pressure by a cylinder on a form of types laid upon a table, which was passed beneath it by a forward and retrograde motion; the inking being effected as in the above described perfecting machines. Having received one side by this means, the sheets were afterward printed on the second side; such second impression containing the news up till the

latest hour of going to press. This species of single cylinder printing-machine was well adapted for newspapers of which only a few thousand copies were wanted; and for this purpose it is still in use, particularly in provincial towns in Great Britain. As presses of this sort, however, do not usually yield more than 4,000 or 5,000 impressions per hour, they are quite unfitted for printing newspapers having a circulation of 20,000 copies and upward, the whole of which must be promptly produced by a certain hour every morning. The liberation of newspapers from the obligatory penny-stamp in 1855 caused so great an increase of circulation that none of the ordinary processes, including that just referred to, was at all adequate for the work required. Recourse had to be made to an entirely new method of printing, the invention of which is due to Richard M. Hoe of New York.

Hoe's process consisted in placing the types (for which stereotype plates were afterwards substituted) on a horizontal cylinder revolving on its axis, against which the sheets were pressed by exterior and smaller cylinders. The pages of type were arranged in segments of a circle, each segment forming a frame that could be fixed on the cylinder. These frames were technically called *turtles*. By the ingenious contrivance of making the brass rules that separate the columns of a beveled or wedge shape, the thinner edge being toward the surface of the turtle, the form of type was susceptible of being tightened up and made firm. The forms occupied only a portion of the main cylinder, the remainder affording space for the inking apparatus. The smaller surrounding cylinders for effecting the pressure were arranged in a frame-work, in connection with slopes, by which the sheets were fed in blank, and came out printed on one side. The size of the main cylinder, the number of exterior cylinders, and the rate of speed determined the

FIG. 3.

number of impressions printed per hour. Such was the method of working Hoe's rotary machines, which, as wanted, were made with 2, 4, 6, 8, or 10 subsidiary cylinders. The first introduced into Europe (with the exception of one made for the Paris newspaper, *La Patrie*, in 1848) was one with six cylinders for printing *Lloyd's Weekly Newspaper* in London in 1857. Some idea of the process of working may be obtained from Fig. 3, representing a rotary machine with six feeders. Such a machine with its six feeders, each laying in sheets at the rate of 2,000 per hour, could deliver 12,000 impressions in the hour; and those with 8 and 10 cylinders in proportion.

About the time that the Hoe machines came commonly into use, another great advance was made in the art of rapid printing. In 1859 a long series of experiments ended in the successful substitution of curved stereotype plates for pages of movable type. Besides escaping the risk and wear involved in working pages of type in circular chases, the new method relieves the types from all direct printing-work, so that the font instead of two years may last twenty.

The Hoe machine, however, with all its advantages, retained the inconvenience of printing only one side at a time, and the multiplication of the feeding cylinders introduced too many complications. These difficulties have been entirely overcome by a new machine, the "Walter," contrived and perfected between 1863 and 1868 by the manager of the *Times* printing establishment, which prints both sides by one operation from a continuous roll of paper. The "Walter" machine is represented in Fig. 4.

A reel of tightly rolled paper, just as it leaves the mill, is placed at one end of the machine, is damped while passing between small cylinders, and is then led between the first and second of four cylinders, placed one above the other, where it receives its first impression from the stereotype cast of the first cylinder. The paper then returns backward between the second and third cylinders; and passing forward again between the third and fourth, receives on its other side the second impression from the stereotype

plates of the lowest cylinder. The roll is next cut into sheets, and the sheets numbered by an index. Carried up to the top of the machine the sheets descend perpendicularly, and are thrown alternately backward and forward on to boards held by two lads. These, with the striker, who starts the machine, are the sole attendants necessary. The paper travels at the rate of 1000 ft. per minute, and the finished sheets are delivered at the rate of 12,000 copies and upward per hour. Repeated experiment has proved that good work may be done at the rate of 17,000 copies per hour. The other web-printing machines differ more or less considerably in idea or details from that just described. The "Bullock," which is the invention of an American, has also done excellent book-printing at the rate of 12,000 sheets per hour. The "Victory," nearly contemporaneous with the "Walter," differs from it in several points. It does not damp the paper; it has only a single delivery; but it delivers the finished sheets ready folded. The "Prestonian" will print from type, whereas all other web-machines print only from stereotype. One of the most recent web-printing patents is the Hoe web-machine, which is also very favorably spoken of.

By the introduction of the steam-presses which we have now described, the profession of the printer has within these few years undergone a most extraordinary revolution; and although fewer hand-pressmen are now employed than formerly, the increase

FIG. 4.—The Walter Printing Press.

of employment to compositors, engineers, book-binders, book-sellers, etc., must be very great. The principal advance in the profession has been since the year 1832, when the printing of cheap literary sheets rose in importance; and, by a fortunate coincidence, the patents of various machines having about the same time expired, a new impulse was given to the trade. The making of printing-machines has in itself become a great business. The printing-office is a factory; and the interior of one of those concerns usually presents a remarkable spectacle of industry, animate and inanimate, which to a stranger leaves a lasting impression on the memory.

In printing, a remarkable American invention was brought into use in 1867. It is called the matrix compositor, and is only adapted for stereotyping, by making impressions on thick, soft paper of the letters in the order required, and then taking casts of the same in metal as usual. The peculiarity of this machine is that it brings up any letter the compositor wishes to its right place in the line by simply touching the key which answers to that letter, in an arrangement like the front of a piano, each key being marked with its corresponding letter. At the moment the letter is brought to its place, it is made to press into the paper; and in this way the composition proceeds with only one alphabet of fixed types, which are made of steel to bear the pressure. With practice a good compositor will work this machine, and thus form the matrix for the stereotype plates, as fast as he could set up the ordinary movable types. The saving in time and the wear of type is therefore very considerable.

PRINTING (*ante*). The first web-perfecting press was invented by sir Rowland Hill, the well-known English advocate of cheap postage. His machine was built in 1835, but was found impracticable; and although Jephtha A. Wilkinson and Richard M. Hoe made efforts to improve it up to the desired point of availability, it was without success. It was not until 1861 that the first practical perfecting machine was invented by William A. Bullock, an American, and set up in Cincinnati. It is to be remembered that to col. Hoe was due the improvement of printing from a rotary cylinder; to which the addition of the web-perfecting system, as completed by Bullock, was the necessary adjunct to insure the grand results which have followed in the art of newspaper printing. The Bullock press was followed by the Walter (English) press (see **PRINTING**), *ante*; but neither of these could produce more than 10,000 perfect impressions per hour, and an increase in capacity became necessary to correspond with the increasing circulation of the daily press. This improvement was effected by R. Hoe & Co. in their perfecting press, which was brought up to a capacity, when pushed, of 18,000 copies per hour. The paper for this press is manufactured in rolls or continuous "webs," one of them turning out a strip of paper $4\frac{1}{2}$ m. long, and of suitable width. This is delivered wound on a wooden roller, and is wet by being passed under a spray while being transferred from one roller to another. Having been properly wet, it is placed in position in the press, one end of the paper being drawn between the proper cylinders at the rate of about 10 m. an hour. It thus receives its two impressions, when it is carried between a pair of cutting cylinders, which perforate it, but do not divide it, and it continues its journey, over endless tapes, until it reaches a set of rollers which divide it. It is not, however, carried immediately to the fly, but an "accumulating cylinder" receives it until six sheets are ready for delivery, when these are placed on the receiving table in an orderly pile. Delivery occurs at the rate of 300 sheets per minute, involving only 59 movements of the fly to secure them. By combining with the press a folding-machine it became possible to deliver the papers folded, and ready for mailing. By these improvements a simplification of machinery was accomplished, which dispensed with the large number of hands formerly required to run the press, and receive and fold the papers. The Hoe perfecting and folding press is about 5 ft. high, 6 ft. wide, and 24 ft. long; including the folding attachment. In 1875 a web-perfecting press was invented by A. Campbell, which can print, paste, and fold any number of pages up to 24.—Comparatively little heavy printing is now done from type, either stereotype or electrotype plates being used. The papier-mâché process of making plates has made possible the rapid production of large editions of newspapers, and this process is worked as follows: the paste is made of a composition of flour, starch, alum, and water, the latter being added boiling, after which the compound is stirred over a fire until boiling, and then left to cool. When used, Spanish whiting is added, after which the paste is spread on a sheet of soft, unsized paper, and then covered with three sheets of tissue paper, when the whole is saturated with water, and laid aside for a day. The face of the type being touched with olive oil, powdered French chalk is put on the tissue side of the prepared matrix, and it is laid carefully on the type. Damp linen is laid over it, and the whole is beaten lightly with a brush against the type. This linen being removed another sheet of the prepared paper is placed on the back of the matrix, when both are beaten in the same way as before, which completes the impression and unites the two sheets. A blanket being now put over the matrix and form, the whole is placed in the drying-press, which is screwed down, when steam heat is applied until the matrix dries. When this is accomplished the matrix is taken out, warmed on the molding-press, and placed in a heated casting-mold, and the metal is poured in. The plate is afterward taken out and finished. In order to have a curved plate it is only necessary to have the mold curved. The paper matrix is not injured by one casting, but will serve to supply as many as twenty duplicate plates.—Electrotyping was first applied to printing by Joseph A. Adams, a wood-engraver, in New York, who reproduced engraved work by the process in 1843, when it was applied in the printing of *Harper's Illustrated Bible*. The form being coated with graphite, using a soft brush, a mold is made of beeswax; the latter, after melting, being run into a shallow pan. An impression of the form is taken in the wax, after which finely pulverized graphite is worked into the letters and lines, either dry, or by Knight's wet process. The mold, thus prepared, is placed in a solution of sulphate of copper, and made part of an electric circuit, which includes also the zinc element in the sulphuric acid bath. The current deposits a copper film on the prepared surface of the mold, and when this has reached the requisite thickness, the latter is taken from the bath, the wax removed, the shell trimmed, the back trimmed and filled with an alloy of type metal, and shaved, when the plate is ready for use, and will print as many as 300,000 impressions. Copper-faced type were invented by Dr. L. V. Newton, of New York, in 1850; and stereotype-plates are also copper-faced, the process enabling longer use.—Type-setting and distributing machines have interested the inventors of printing-material for more than half a century, and more than 100 patents have been granted in Europe and America for machines for this purpose. In 1820 Dr. Wm. Church, of Connecticut, patented a composing-machine, but it did not become popular. One was invented in Copenhagen, which met with better success, and was used on a local newspaper. It was exhibited in operation at the Paris exposition of 1855, composing and distributing the type at the same time.

The capacity of this machine was considered equal to three compositors. In 1856 Robert Hattersley, of Manchester, Eng., invented a machine which set about 4,000 to 6,000 per hour, and was accompanied by a distributing machine. At the London international exhibition of 1871, a machine invented by A. Mackie, an Englishman, was exhibited, which could be worked by steam. In 1871 the proprietor of the Warrington, Eng., *Guardian* patented a steam type-composing-machine which was successfully used in a number of English printing-offices. It was claimed that this instrument, with one man and three boys to feed the type and space out the lines, would set up a newspaper column as large as a column of the London *Times* in one hour, which the inventor asserted was equivalent to the composition of eight men. This machine cost £500. In 1875 M. Delacambre, a Frenchman residing in New York, completed a composing-machine on which he had worked 20 years. Another was produced in Boston, in 1870, by O. S. Brown, which did both composing and distributing. The Alden machine, which has perhaps been the best known of any, was begun by Timothy Alden of Massachusetts, in 1846, and improved by his brother, Henry W. Alden. In 1875 two machines were patented by A. C. Richards, one of which was for composing, the other for distributing. An ingenious machine patented in 1875 by Charles S. Westcott, of New Jersey, cast the type from molten metal which was supplied from a tank, a matrix being arranged for every character, and which provided the one which was called for by the pressure of a key. This machine did not require any distributing apparatus, the dead metal being melted up as required. Although none of these machines have come into general use, a number of them have been operated in one printing-office in New York for several years with entire satisfaction. The objections urged against their use are: 1st, their expense; 2d, the amount of type-breaking which most of them accomplish; 3d, their liability to get out of order, and the constant expense of repairing them.

The principal type employed in ordinary English printing are the following, arranged in order according to size. brilliant, diamond, pearl, agate, nonpareil, minion, brevier, bourgeois, long primer, small pica, pica, English, great primer. Among the large number of newspapers published in New York, few do their own press-work; and extensive establishments exist, running from 10 to 50 presses, working day and night, and printing weekly and even daily papers, at a specified cost per token for press-work. So systematic has the business of newspaper printing become, that other establishments receive the printed sheets from the press-room, and fold, wrap, and direct them for the mail, finally sending them to the post-office and paying the postage, charging the latter expense, with a fair compensation for their labor in their bills. In book and job-printing, the composition and press-work are somewhat more frequently done in the same establishment. Some manufacturers conduct the entire production, including binding, and electrotyping, and stereotyping, under one roof. An important adjunct to a large printing-house is the proof-reader, with his corps of assistants; and such a staff is maintained by every large newspaper and book-publishing house. Proofs are usually first taken from the type in the galleys; these are read by the proof-reader, and returned for correction, after which a second proof is pulled for revision; in the case of book-work, page-proofs are next pulled and read; and with newspapers, proofs in form. The head proof-reader is usually a man of good education, a practical printer, acute and quick in discerning errors in style as well as typographical errors; and, moreover, one well versed in general knowledge.

The first style of type cast was the gothic or old German text, with which the Mazarin Bible was printed about 1453, a copy of which was sold at auction in New York in April, 1881, for \$8,000. Greek characters were not used until 1465, and the Roman type two years later. What is known as the *italic* was invented by Aldus Manutius about 1500. The Hebrew letter was first used in a Bible printed in Italy in 1488. The first book printed in English was a translation of the *Recueil des Histoires de Troyes*, printed by William Caxton in 1471, and of which a few leaves can be seen in the Astor library, New York. It was not until the close of the 16th c. that books began to be printed in the Oriental languages. At present the large printing establishments in the chief cities of Europe and America can supply fonts in nearly all written languages; and the imperial printing-office in Vienna has the Chinese, Sanskrit, Egyptian (hieroglyphic), Assyrian (cuneiform), and others not to be found elsewhere. A copy of the Lord's prayer was printed in that office in more than 200 different languages and dialects; and in the national printing-office in Paris are fonts including 56 Oriental languages, and 16 European languages that do not employ the Roman letter.

PRINT-WORKS, in point of law, are regulated by the statutes 33 and 34 Vict. c. 62, and 37 and 38 Vict. c. 44, so far as regards the labor of children, young persons, and women; and the statute applies to all buildings where persons are employed to print figures, patterns, or designs upon any cotton, linen, woolen, worsted, or silken yarn, or woven or felted fabric, not being paper. The works are subject to the inspection of the factories' inspectors, to whom particulars of the business and place are to be duly sent. Children under 10 years of age are not to be employed. No child under 14, or female, is to be employed during the night. Children under 14 must be sent by the parent to school for at least 60 days in the year, and certificates of these school attendances must be obtained before a child can be employed. A child between 13 and 14 ranks as a

young person if holding a certificate of proficiency in reading, writing, and arithmetic. A register is to be kept of all the persons employed, and the times of employment; and the employment of any one contrary to the act, subjects the occupier of the works to a penalty.

PRIOR. See **MONASTERY.**

PRIOR, MATTHEW, an English poet, was b., it is supposed, in Loudon, where his father was a joiner, on July 21, 1664. He was educated, through the liberality of an uncle, at Westminster school; and in 1682 he was sent by the earl of Dorset, whose friendship he had formed, to St. John's college, Cambridge. Here he took his B.A., obtained a fellowship, and made the acquaintance of Charles Montagu, afterward earl of Halifax, in conjunction with whom he produced *The City Mouse and Country Mouse*, written to ridicule Dryden, in which it did not in the least succeed, although it lives yet in virtue of its own wit, polish, and grace.

After 1688 Prior was introduced to court by the earl of Dorset, and was appointed secretary to the embassy which was sent to the Hague in 1690. His conduct gave satisfaction to King William; and the lucky and well-mannered poet was appointed afterward to several posts of a similar description. He was a favorite at the courts of Holland and France. In 1701 Prior entered parliament; and soon after he deserted the whigs, and went over to the tory party. In 1711 he was sent by government to Paris with private proposals for peace, and on his return he brought with him one of the French ministers, who was invested with full powers to treat. At Prior's house, shortly after, the representatives of the British government met the French plenipotentiary; and his connection with this meeting was made the ground of a charge of treason, on which he was committed to prison, but released after a confinement of two years, without a trial. He had now nothing to live by except his fellowship and his wits. The publication of his poems by subscription, however, brought him 4,000 guineas; and at the same time, lord Harley, son of the earl of Oxford, bought a small estate in Essex, and conferred it on him for life. At the age of 57 he died at the seat of the earl of Oxford, Sept. 18, 1721. A monument was erected to him in Westminster Abbey.

Prior was one of the few poets who was also a diplomatist and man of the world. He filled his public offices with credit to himself, and he had the knack of making friends among those who had the giving of places and pensions. His poems, which comprise odes, songs, epistles, epigrams, and tales, are not much read. He has no fire, no enthusiasm, but everything is neat, pointed, well turned; and his lighter pieces are graceful and witty. If there is little inspiration in his verse, there are the polish and felicity of a scholar and man of society.

PRISCIAN (Lat. *Priscianus*), surnamed **CÆSARIENSIS**, either because he was born or educated in the town of Cesarea, is perhaps, in point of reputation, the first of Latin grammarians, though one of the last in point of time. He belongs to the middle of the 5th c., if he is not even considerably later, for he is mentioned by Paulus Diaconus as a contemporary of Cassiodorus (468-562 A.D.). He taught Latin at Constantinople, probably to the imperial court, for he enjoyed a government salary. The work which has mainly preserved his name is his *Commentariorum Grammaticorum Libri XVIII.*, dedicated to his patron the consul Julianus. The first 16 books treat of the different parts of speech as conceived by the ancients; the remaining two are devoted to syntax, and in one MS. bear the separate title of *De Constructione libri duo*. Priscian's Commentary is, for the time, a solid and comprehensive work, the production of a man of great learning and good sense, and is enriched with quotations from many Greek and Latin authors no longer extant. The epitome executed by the German bishop, Rabanus Maurus (flor. in the 9th c.), was very popular in the middle ages. Besides the Commentary, Priscian wrote six smaller grammatical treatises, and two hexameter poems of the didactic sort, *De Laude Imperatoris Anastasii*, and a free translation of the *Periegesis* of Dionysius. The first edition of Priscian appeared at Venice (1470); the best is that by Krehl (2 vols., Leip. 1819-20).—The phrase, "to break the head of Priscian," means to grossly violate the rules of grammar.

PRISCILLIAN, the author, or rather the chief propagator in Spain, during the latter part of the 4th c., of the doctrines professed by the sect known from his name as **PRISCILLIANISTS**. The first seed of their doctrines is said to have been carried into Spain by a Memphian named Marcus. Priscillian was a man of noble birth; and by his eloquence and ascetic life obtained so much consideration, that a numerous party, including some priests and at least two bishops, attached themselves to his school. His doctrine was substantially that of the Manichæans (q.v.). He taught expressly the *Dualism* and the *Docetism* of that sect, and it is equally certain that he adopted the moral consequences as to marriage, etc., by which they had rendered themselves obnoxious even to the civil authorities in the east and Africa. He was warmly opposed by two bishops, Idacius and Ithacius; and the council of Cæsar-Augusta (Saragossa) having in the year 380 condemned his doctrines, a decree for his banishment was issued in the same year. He not only obtained, however, a reversal of this decree, but succeeded in effecting the banishment of his chief opponent, Ithacius. By an appeal to the usurper Maximus at Treves, Ithacius caused Priscillian and several of his followers to be brought to trial,

and put to death, in 385; a proceeding which was regarded with so much abhorrence by St. Martin of Tours, St. Ambrose, and other bishops, that they separated from the communion of Ithacius. The sect did not die out with its founder, though there was a considerable reaction against it at the close of the 4th c.; and at all times through the mediæval period we find its traces under various names and forms, especially in the n. of Spain, in Languedoc, and in northern Italy.

PRISM, in geometry, a solid figure which can be most easily conceived of if we imagine a number of plane figures (triangles, quadrilaterals, etc.) exactly similar in form and size to be cut out of paper or any thin plate, and piled one above the other, and then the whole pile to become one body. It will thus be seen that the top and bottom of the prism are similar, equal, and parallel to each other, and that the sides are plane figures, rectangular if the prism be "right" (i.e., if in the above illustration the pile of plane figures be built up perpendicularly), and rhomboidal if the prism be "oblique" (i.e., if the pile slope to one side); but under all circumstances the sides of a prism must be parallelograms. The top and bottom faces may be either triangles, squares, parallelograms, or quadrilaterals of any sort, or figures of 5, 6, 7, etc., sides, provided only both are alike; and the number of sides in the plane figure which forms the top or bottom, of course determines the number of faces of the prism; thus, in a triangular prism, there are 5 faces in all (3 sides and 2 ends); in a quadrangular prism, 6 faces (4 sides and 2 ends), etc. If two prisms, one being "right," and the other "oblique," have their bases of equal area, and be of the same vertical height, their solid content is the same, and is found by multiplying the area of the base by the vertical height. The parallelepiped (q.v.) is a quadrangular prism, and the *cube* is a particular case of the parallelepiped.—**PRISM**, in optics, is a triangular prism of glass or other transparent substance, its two ends being isosceles triangles, and having most frequently a very acute vertical angle, which gives the prism the appearance of a long wedge. The prism is a most important instrument in experiments on the refraction of light, and, in the hands of the most eminent optical philosophers, has been the means of largely adding to the science of optics. See **REFRACTION**.

PRISON DISCIPLINE means the method in which criminals, or other persons subjected to imprisonment are managed. In this, which is its original sense, prison discipline, as actually practiced, may be good or bad in the estimation of the person speaking of it. Of late, however, the term has obtained a new meaning, having been used to express not merely the practice of ruling prisons, but the science of properly ruling them. It has gone even further, and sometimes has been used to express the principles of penal administration or the philosophy and practice of punishment. This has arisen from the circumstance, that gradually other punishments have been dropped in this country, and detention within edifices and the grounds attached to them has become almost the only method of punishment for crimes. Torture, exposure in the pillory, and other like dedications of the offender to public vengeance, have been long abandoned as barbarous. Death-punishment has been much narrowed in its application; and transportation, apart from any question as to its effectiveness, has been rendered impracticable, except within a very narrow compass. We get nothing from the practice of the times anterior to Christianity, nor yet from that of the middle ages, to help us in estimating modern systems of prison discipline. They are a development of civilization; and, contradictory as it may seem to say so, of personal liberty. The institution of slavery renders any such system unnecessary. It removes the function of punishing ordinary criminals from the public administration of the affairs of a state, and places it in private hands. Hence, we have no criminal law, properly speaking, coming down to us from antiquity. The *corpus juris*, so full of minute regulations in all matters of civic right, has very little criminal law, because the criminals became slaves, and ceased to be objects of the attention of the law. When imprisonment became a function of the state in the administration of justice, it was often carelessly, and hence tyrannically, exercised, because the practice of awarding it as a punishment arose more rapidly than the organization for controlling its use. On several occasions, grave abuses have been exposed by parliamentary inquiries and otherwise in the practice of prison discipline in this country. The exertions of Howard, Mrs. Fry, and other investigators awakened in the public mind the question, whether any practice in which the public interest was so much involved, should be left to something like mere chance—to the negligence of local authorities, and the personal disposition of jailers. The tendency lately has been to regulate prison discipline with extreme care. The public sometimes complain that too much pains is bestowed on it—that criminals are not worthy of having clean, well-ventilated apartments, wholesome food, skillful medical attendance, industrial training, and education, as they now have in this country. There are many arguments in favor of criminals being so treated, and the objections urged against such treatment, are held by those who are best acquainted with the subject to be invalid; for it has never been maintained by any one that a course of crime has been commenced and pursued for the purpose of enjoying the advantages of imprisonment. Perhaps those who chiefly promoted the several prominent systems expected from them greater results in the shape of the reformation of criminals, than any that have been obtained. If they have been disappointed in this, it can, at all

events, he said that any prison in the now recognized system is no longer like the older prisons, an institution in which the young criminals advance into the rank of proficient, and the old improve each other's skill by mutual communication. The system now received is that of separation, so far as it is practicable. Two other systems were tried—the silent system and the solitary system. The former imposed entire silence among the prisoners even when assembled together; the latter endeavored to accomplish their complete isolation from sight of or communication with their race. By the separate system, the criminals are prohibited from communicating with each other; but they are visited by various persons with whom intercourse is more likely to elevate than to debase—as chaplains, teachers, scripture-readers, the superior officers of the prison, and those who have the external control over it.

PRISONERS OF WAR are those who are captured from the enemy during naval or military operations. By the laws or recognized principles of war, the entire people of a vanquished town, state, or nation become the absolute property of the victors; but civilization has greatly modified this stern rule, and except when a country is devastated for military reasons, it is rare for non-combatant citizens to be subjected to penalties of conquest, beyond the levying of contributions in money or provisions. The combatants who have laid down their arms become prisoners of war. Their lives and liberty are at the disposal of their conquerors, and even in modern times, their lives are sometimes taken, as, for instance, when Napoleon put the Turkish prisoners to death at Jaffa in 1799; otherwise, prisoners of war are kept in confinement until peace ensues, or they are exchanged for prisoners of their conqueror's nation, held in captivity by their own countrymen. It is unusual to subject prisoners of war to penal discipline; but the loss of liberty and hard fare (for, of course, they are allowed no more than a bare subsistence) render captivity sufficiently irksome. In ancient times, the treatment of prisoners of war was far more severe. In the Greek wars, it was no uncommon thing to put the whole adult male population of a conquered state to the sword, while the women and children were enslaved. Although the putting to death of prisoners became less frequent, they and their families were commonly reduced to slavery to as recent a period as the 13th century. About that time, the more humane custom of exchanging prisoners came into practice. Notwithstanding frequent exchanges, large numbers of prisoners accumulate during war. In 1311 about 47,600 French were prisoners in England, while 10,300 English languished in the prisons of France. See **PAROLE**.

PRISONS AND PRISON DISCIPLINE (*ante*). To regard criminals with a kindly view to their reformation, or at least to their moral improvement and physical comfort, is a recent development of our civilization; and the progress already made is not to be boasted of. What has been done is aimed to attract criminals into the ways of industry, instead of so conducting punishments as to breed new vices.

The first step in prison reform was in Italy, 1704, by pope Clement XI. in the establishment of the prison of St. Michael for boys and youths, on the plan since known by many names, and lastly as the "Auburn system"—the system of separate cells at night, and silent associated labor by day. "Howard visited it and praised it a hundred years ago," and found within it on a marble slab this inscription in Latin, "It is of little use to restrain criminals by punishment, unless you reform them by education." In England in 1728 gen. Oglethorpe, the founder of the state of Georgia, then in parliament, procured the appointment of a committee of the house of commons "to inquire into the state of jails in this kingdom." The inquiry awakened general indignation at the shameful and cruel condition of the prisons, expressed through pamphlets, newspapers, and by the cartoons of Hogarth. But there was no efficient government action behind it, and small good came of it. In 1735 another reformer, William Hay, pointed out the horrible abuses of the prison system, and made a clear and concise statement of the remedies. At the same time Wesley and Whitefield preached and prayed for reform; but the government took side with the prison tyrannies, and forbade their preaching "sedition." Blackstone's commentaries in 1763 shook public confidence in the barbarous system, sustained by a semi-barbarous government, but its influence worked slowly. Montesquieu's *Spirit of Laws*, in France, and Beccaria on *Crimes and their Punishments*, in Italy, widened the circle of intelligent warfare on barbarism entrenched in the feudal governments and laws of all these countries. John Howard, in 1758, began his wonderful career of 31 years in visiting the jails of England, Belgium, France, Germany, Italy, Denmark, Sweden, Russia, Spain, and Portugal, and their pest-houses as well, and even sought where pestilence raged in Malta, Smyrna, and Constantinople, to study the means of relief from it. No man has united more remarkably the zeal of a martyr with the calm intelligence of a statesman in the service of philanthropy. In 1772 a clergyman of the name of Denne proposed the thing which pope Clement XI. had done in 1704, in a pamphlet which attracted attention. About the same time Howard being made high sheriff for Bedfordshire, practical improvements in England began, and have since worked very slowly, to a better state of things. In 1765 the empress Maria Theresa, of Austria, gave her aid to the work. Viscount Vitain XIV., in 1775, founded the convict prison at Ghent, having separate cells and a more intelligent and humane system of discipline than ever before attempted on a large scale.

"Here then," remarks the rev. Dr. E. C. Wines, "in the prison of Ghent, we find already applied the great principles which the world is even to-day but slowly and painfully seeking to introduce into prison management. What are they?"

When Howard died the general movement lost its force, and reforms fairly begun gave way to the reflux tide of former abuses. Jeremy Bentham, in 1791, renewed public attention to the subject. In 1813 Elizabeth Fry, a lady of aristocratic connections in London, a member of the society of Friends, a devout woman singularly endowed with benevolence, strength of will, and feminine graces, commenced her visits to Newgate prison. She found the condition of women in prison simply appalling, and awakened a new interest in prison reforms. Wilberforce and Buxton aided her in parliament. In 1823 sir Robert Peel put aside the medley of old English laws pertaining to prison discipline and framed a new code called the consolidated jail act, which went into immediate effect. It was a crude law, providing for no classification among convicts, but it made some steps forward, and swept away still more vicious old laws, under which prisons were simply hot-beds for propagation of crime.

In the United States prison horrors in the early days differed only from those of the parent country in the fact that prisons were rare, and of so simple a character that it was not so easy for shameful cruelties to be practiced unseen as in great dungeons. Dr. Wines states that "Connecticut for more than 50 years, 1773-1827, had an underground prison in an old mining pit near Simsbury, which equaled in horrors all that was ever related of European prisons." In Philadelphia all grades of criminals, and both sexes, were mingled in horrible disregard of decency and humanity, in the city prisons; and liquors were served to prisoners from a bar kept by a prison official. In Boston it is told that a thousand debtors were confined in common night-rooms with a thousand criminals. "Men, women, boys, lunatics, drunkards, innocent and guilty, were mingled pell-mell together." In New York in the early days, negroes were burned alive and hanged in iron frames to die of starvation. Every village had its stocks, pillory, and whipping-post. Delaware alone retains them. Reforms began in Philadelphia by the formation in 1776 of the "Society for alleviating the miseries of public prisons;" reorganized more efficiently in 1787, and said to be still active and useful. The Boston "Prison discipline society" was organized in 1824, existed for 20 years, and accomplished its mission. The "Prison association of New York," organized later, and is still active.

Americans (omitting the living) whose work in promoting prison reforms has been too noble to be passed over without mention, are Dr. Rush, Elam Lynds, Gershom Powers, Roberts Vaux, Matthew Carey, Louis Dwight, Amos Pillsbury, Francis Wayland, Francis Lieber, Charles Sumner, Samuel G. Howe, John D. Wolfe, John Stanton Gould, John W. Edmonds, Isaac T. Hopper, William H. Seward, Abraham Beal, and Dr. E. C. Wines. In 1870 the "National prison association of America" was formed, now becoming one of the most efficient in the world, unifying all the humanitarian influences of all the state officials into one body. Their intelligent and practical study of prison questions, their comparison of experiences and methods, their essays and reports, form a college of intelligence that cannot fail of beneficent results. Prison reform congresses were held in Cincinnati in 1870, Baltimore in 1872, and St. Louis in 1874. In Europe a congress of those particularly interested in prison improvements was convened at Frankfort in 1845, under the direction of Dupetiaux, inspector-gen. of prisons in Belgium. Many others have followed. A permanent commission to collate information was appointed at the London congress in 1872, which commission held a session at Brussels in 1874, and at Bruchsal, Germany, in 1875. France and Italy have similar national commissions. In the United States, state legislation has seconded the efforts for reform.

The tendency of experienced men in prison discipline is now to longer terms of imprisonment, in order to control and complete reformation. They also insist on massing the prisons of a state into great establishments where thorough systems can be carried out to better advantage, where appliances for every practicable trade can be provided, and where the petty tyrannies and indecencies of common jails are less likely to obtain. The propriety of definite sentences for crimes is questioned, and it is claimed that the officers of the prisons should have a wide discretion, and that conduct, character, and degree of reformation should have very much to do with the long retention or the earlier freedom of the criminals. Separation of prisoners from each other, or the single-cell system, forms not only one of the greatest punishments for most criminals, but one of the most essential means of preventing the scandals of old prison-yards, where the most skillful and hardened criminals could exchange and increase each other's knowledge of crime, where the greatest criminal was the hero of the circle, and the younger or less vicious inmates were exposed to all the brutalizing influences of a robber's den. Pennsylvania has the honor of having made the first great step in the amelioration of the condition of prisons and prisoners. In 1786 in the new Walnut street prison the system of solitary confinement in single cells was begun, but under conditions that rendered it a failure. Absolute seclusion, without books or society, resulted not in reform, but in savage moodiness and insanity. It has been tried in several states, under more humane conditions, by giving prisoners an abundance of reading matter, opportunity to talk with keepers, and by occupation for both body and mind during the day in some

industry. Now, while a good system requires that each prisoner shall have his separate cell, congregated work is practiced; cells are lighted to allow reading after work hours; conversation with prison attendants is not discouraged; and men known or supposed to be not injurious to each other's character, or likely to concoct mischief, are permitted communication with each other. Associated labor in gangs, or in work-shops in absolute silence, theoretically, and absolute isolation in cells having no means of communication one with another, constitute the cellular and associated labor-system in use in most great prisons in the United States. Of course the absolute silence enjoined between men working together side by side, day after day, and year after year, is of itself a terrible punishment. But it is unfortunately the worst punishment for the best class of criminals, for just in proportion as the inmates are endowed with those qualities which tend to make them decent and agreeable members of society—intelligence, sociability, kindness—in that proportion are they punished by being deprived of the power to exercise their good qualities. Those who are constitutionally ugliest are apt to be morose at the best, brood over their work with least longing for fellowship, and least punishment; while both the best and the worst of these who thus only can speak to their fellows by stealing their opportunity, are neither improved nor reformed by the enforced silence. All are under a continual pressure to steal—not objects of value to others, but their own power of speech and means of fellowship.

The originator of the ideal system to which our prisons are making gradual approaches—called the system of progressive classification—was the English capt. Alexander Maconochie, a worthy successor of the noble Howard, who 40 years ago perfected a system, and on his own application was made governor of the British penal-colony of Norfolk island, for the purpose of putting it to practical test. There were then 1500 convicts on the island, made up of the worst malefactors from Britain. Maconochie called his plan the "social system of prison treatment." Its basis is the belief that a state of cheerfulness, hopefulness, and kindly treatment is essential for improvement and reform among criminals. His system proposes four main aims and methods, as follows: 1. A labor sentence instead of a time sentence, so that prisoners know at once that they can by labor shorten imprisonment in proportion to industry. 2. To enable them to have their punishment further lessened by their good behavior daily recorded, and cumulative to their advantage, thus placing a constant premium on self-restraint. 3. By giving degrees of social liberty in proportion to the good use made of it, and encouraging the exercise of mental qualities. 4. By giving the prisoner a part of the wages of his labor, to be put in his possession on leaving the institution, or to go to his family, and preparing him to resume a decent place in society by showing confidence in him, and releasing him from restraint in proportion as he develops self-respect and disposition toward good citizenship. Thus the prison life is regarded as one in which the convicts are to be re-reared—as a family of peculiar children, each of whose peculiarities was to be considered. It is assumed that the worst of traits in a convict do not prove him devoid of some good ones; and that the incentives to good life should be made much greater and more pleasant than to a bad one. The work of testing his system began by offering the convict pay for his work by marks, with which marks when earned he could buy his own food, clothes, and other necessities, and form a surplus to be credited to his liberation, on the supposition that he is sentenced to a specific number of days' labor, or marks. He fixed ten marks as the equivalent of a day's labor; then paid by the piece, and not by time, and for every ten marks saved the term of imprisonment was lessened a day. Prisoners could buy their own provisions at three different rates, paying for them in marks at the supply store of the prison. The poorest fare cost three marks, the next four, and the best five. Thus the zeal for freedom would stimulate not only industry, but the utmost self-denial and economy. Over-work was paid for in extra marks at the same rate as regular work; and misdemeanors of any kind being subject to a fine in marks, the mark-record of prisoners was at the same time their industrial and moral spur and their savings-bank. He did not attempt to bring about the emulation and ambition which this system is calculated to inspire by at once supposing the prisoners to be ready for it, but divided the terms of their sentences into three periods. During the first, or punishing stage, the men were subject to close surveillance and discipline. At the expiry of this term they could divide themselves into companies of six, by mutual consent only. Each six were to have a common fund of marks, into which all their earnings were to be paid, and from which the fines of any and all that company must be paid. This is, perhaps, the most original reform of the whole system, and at once makes the germ for the growth of all the qualities that are essential to a good member of society. Each man becomes interested in the industry and good behavior of his associates in a manner so direct and palpable in every way that the effect of the voluntary partnership is to keep all the partners in a continual state of watchfulness and emulation, or of shame to the one who may be derelict to the interests of his immediate companions. Dishonest and selfish as they might be, they are thus made to feel that shirking by any one of them hurts all; so that a majority must all the time use a pressure for industry and fair play. As they had no way of punishing each other for short-comings, the consequence was the creation of an honorable conception of mutual duty and forbearance. In the third period of the sentence the prisoner was to be thrown on his individual character, and to be permitted, under the same system of marks or

wages, to profit or lose for himself alone according to his industry and good behavior. In the tropical island of Norfolk, where the experiment was undertaken by capt. Maconochie, he was able to add some privileges to the prisoner in the third term of the sentence not practicable everywhere. He was allowed a hut and garden, pigs and poultry, which might be sold for his benefit to the ships that touched at the island. Thus, by all these means this great reformer taught the prisoners industry, appreciation of the rights of others, the mutuality of rights and obligations in a community, self-reliance, and self-respect. He spent four years in this experiment and thus states the result: "I found the island a turbulent, brutal hell; I left it a peaceful, well-ordered community." Sir Walter Crofton succeeded him, and organized the system more perfectly to adapt its discipline and methods to the average grade of the persons who have charge of prisons; that is to say, to a much lower level than would be required were such men as Maconochie in charge. Crofton's modified system, also divided into three stages of imprisonment, consists of: 1, a separate imprisonment of 8 months; 2, a reformatory stage proportioned to the whole length of the sentence, in which the system of Maconochie is retained in principle, but modified in adaptation to give the prisoner a progressive or receding position, and a larger or smaller share of earnings as he advances or fails in industry or conduct. Crofton put his plans into full operation in Ireland in 1854, where three separate prisons were provided to accommodate the graduates from lower to higher degrees. Mount Joy, Dublin, with a capacity of 500, received the newly sentenced; Spike Island at Queenstown, with accommodations for 700; received the probationaries in the second term; and Lusk, 12 m. from Dublin, accommodating only 100, held the graduating class. The first prison punished by solitary confinement, relieved only by labor of the most tedious kind, like picking oakum, and the poorest kind of sufficient food. During this time the convict is thoroughly familiarized with the system of progression which he is afterward to have the privilege of availing himself of. The prison at Queenstown receives the prisoner for the second stage; and here begins the system of marks by which he can acquire privileges and curtail his term of punishment, or, by failing to improve, can remand himself back to punishments and original deprivations. This intermediary prison is the main one, where the educational and social progressive system is put into practice. It is divided, like a college, into classes, through which the prisoners must graduate, and, when they have passed through the three into which the prison divides them, the highest class is fitted for the prison of Lusk, and transferred to it. After going through the penal prison of Dublin the prisoner enters the third class at Queenstown. He must earn not less than 18 marks to pass to the second class, 54 to get to the first class, and 108 to graduate from that to Lusk. As 9 marks a month is the maximum number that can be earned—three for industry, three for school duties, and three for conduct—the prisoner must, at the best, remain in the lowest class two months; in the middle class, six months; and in the last, 12 months. Of course, the average of industry, study, and conduct is not such usually as to make the term so short. The prison at Lusk is the most remarkable fruit of the system. Here the prisoner has a degree of freedom and an absence of restraint that puts to the test all his previously acquired self-control and self-respect. There are no walls, prison bars, or armed watchmen before his eyes; no prison garb, physical restraint, or check on social intercourse. The prisoners are employed in groups, mostly on out-door farm work, in company with unarmed wardens, who work with them. They are not even restrained of liberty of escape except by the knowledge of the advantages to be gained by working to the end of their terms, and securing the payment of earnings in store for them. Attempts to leave before the end of their terms have been rare among those who reach this stage of reform. The mark system is not continued at Lusk. The appearance of pupilage is avoided, and men are made to feel themselves a part of the community around them by attending lectures, and public worship at the parish church, and in being trusted in various services out of the eye of any prison officer. There is no physical restraint to prevent their escape day or night. The minimum period of detention at Lusk is 6 months on a sentence of 5 years; 11 months on one of 10 years; 16 months on one of 15 years. At the great intermediary at Queenstown the minimum is 13 months on a sentence of 5 years; 53 months on 10 years; 93 months on 15 years. Prisoners at the two first prisons are mostly employed in bodies, under surveillance, upon public works. They receive no portions of their earnings, but are allowed a certain portion, under the name of gratuities saved for them, and paid to them on leaving the prison at the expiry of their terms. These gratuities are earned by marks during the whole time of their stay at Queenstown, and are forfeitable as one of the punishments for laziness or bad conduct. The greatest possible reduction of the term of imprisonment by good conduct is 13 months on a period of 5 years; 28 months on a period of 10 years; and 3 years and 7 months on a term of 15 years. But the prisoner's freedom is not absolute until the full end of the term for which he was confined. He is provided with a ticket of license for the intervening period; is free to go to work for himself, but must report at regular intervals to the authorities; and, if he fail to keep the conditions of his license, may be remanded back to prison for the remainder of his full term. The same systems, in all respects, is applied to the women convicts at the same places. The basis of the Crofton system is hope. The number of inmates of the prisons just described and their cost for the year ending Mar. 31, 1874, is given in the following table:

PRISONS.	Average Number of Convicts.	ANNUAL COST PER PRISONER.

The United States as a nation has no great prison. Each state maintains one or more large establishments, conducted under many different systems, but in general tending to the "social system of progressive classification," and making more or less progress toward it. Each city also has its special prison. The association of prison management with politics, and the facilities permitted in some states for prison officials to have a considerable patronage at their disposition, including the contracts for the labor of the prisoners, is the most unfortunate feature of United States prison systems. State legislatures tend to the most humane and thoughtful liberality in providing for the accommodation and reformation of criminals; so that when prisons are making little progress toward the ideal which Maconochie and Crofton have proved entirely practicable, it is because the officials themselves are not the right men in the right place. A proposition is now (1881) before the legislature of New York to impede the free visiting of the state prisons by the people, on the ground that such visits interfere with their discipline and order; but such interference is a less evil than would result from leaving the prisons to a close corporation of officials. One of the misfortunes of the prison systems in the United States is a disposition to regard the convicts as slaves of the state, whose labor it has a right to confiscate, and the profit of which is so much clear gain to the treasury of the state. Under the plausible plea of making prisons self-sustaining by this use of prison-labor, legislatures may be pleased with those officials who make the best show of profit out of the prisoners to the state treasury; and to effect this prison-labor is farmed out like slave-labor. If this be done under the inspection of intelligent *disinterested* men, devoted to the main work—that of reformation of the inmates of prisons, it is possible to unite the best interests of both convicts and the state; but it is also possible to make the system only a dreadful form of human slavery. It is a grave question how far the state can justly go in the direction of confiscation of a man's labor.

The excellent reformatory systems now in use have one grave fault. Criminals of an Intellectual type who endanger society not by their passions but by subtle knaveries, when brought to punishment in prisons, have no difficulty in at once making all possible progress in marks that will give them credits toward freedom. With no abnormal passions, or tendencies to physical crimes, it requires no meritorious effort of the will, no unusual self-restraint, perhaps no change of all the knavish habits of a life, to be found worthy of the highest markings. There is a recent case of a man who made great gain by falsifying the entry books of a grain elevator, and then committing arson upon the building. Not for the main crimes which were mysteriously sheltered by some conflicting interests, but for some subordinate part of the crime she was sentenced to three years in the penitentiary. His conduct was excellent, and in considerably less than three years he leaves the prison to enter into the peaceful possession of an ample fortune secured by theft, forgery, and arson.

William Tallack in an essay on humanity and humanitarianism takes ground that in some directions humanity may defeat the object of reform by making the prisons so pleasant for those who occupy them, and the enforced labor so much more agreeable in its surroundings than that of the laborious and virtuous poor, as to make it an object with the latter to do some misdemeanor, in order to enter the reformatories. He cites the house of refuge in Philadelphia as an example of a condition of comfort for the inmates far above that of the homes of ordinary laborers. But this is rather a commentary on the deficient pay for common honest labor than a fault of the prison system. Still Mr. Tallack makes a strong case against those conditions of prison life which deprive it of the character of punishment, and he believes that American prisons may be going too far in the opposite direction from the English tendency to extreme harshness.

There are 45 state prisons in the United States with an aggregate of value of \$16,000,000. New York and Indiana each have three, Pennsylvania and Iowa two. Altogether they contain 17,000 cells and sleeping rooms, which is 3,000 less than the number of prisoners. Many of the cells, however, are for two to four persons, and occasionally dormitories serve for many. The average size of the cells is 8 ft. length, 4½ ft. width, 7½ ft. height; cubic contents 240 feet. The smallest are those of Sing Sing, N. Y., whose cubic contents are but 147 feet. The whole number of officers and employes in these 45 prisons does not vary much from 1500, or one to 13½ prisoners; their aggregate annual salaries \$1,015,000, making their average \$677. To this must be added the board of a considerable part of them, and in some cases lodgings for themselves and families. The total annual cost of all these prisons including pay of officers is about \$3,000,000,

making the average cost of prisoners without credit for their work \$150 each; and an average to each prison of \$650,000. The aggregate earnings of the labor of the prisoners is about \$1,500,000; thus meeting half the cost. But it must be observed that the principal earnings are from a part only of the prisons. Seventeen state prisons are reported as self sustaining, and among these are a few whose receipts considerably exceed the expenses. Seven correctional prisons in which minor misdemeanors are punished with short sentences, more than pay their way by the labor of their inmates. In many of the southern states the lease system prevails—a local form of the coolie trade. Five-sixths of the inmates of the prisons are men, one-sixth women. In the county jails and houses of correction the proportion of women is greater. "The ratio of foreigners to Americans in the state's prisons is out of all proportion to that which exists between the total pop. of foreign-born and native-born inhabitants." Estimating foreign-born population at 12 per cent of the whole we find the foreign born in the prisons to be 25 per cent of the whole prison population. In the eastern, middle, and western states the foreign born in the prisons is nearly and in some states fully one-half the whole number. In the southern states nearly all are natives, and the blacks the most numerous, often being imprisoned for trivial crimes. Prison officers (or a head officer) are appointed in some states by the governors, in some by the legislatures; and in others a state superintendent of prisons is elected. The system of contracting prisoners' labor obtains in 19 states, leasing it in 6, exclusive state management in 9, and a mixed system in 10. The contract system is regarded by the friends of prison reform as open to very grave objections, and is tolerated as a compromise between the desire to make the prisons pay their way and the danger of something more objectionable. It is a dangerous system. Leasing is undoubtedly worse, and has already been alluded to as making the state a slave trader.

The literature pertaining to prison reforms is profuse. The work of the late rev. Dr. E. C. Wines entitled *The State of Prisons and of Child-saving Institutions in the Civilized World*, 1880, is the latest and fullest compendium. *Prisons and Reformatories at Home and Abroad* is the title of the transactions of the international penitentiary congress of London, held in 1872, edited by Edwin Pears, its secretary. *Humanity and Humanitarianism* is a very suggestive essay prepared for the New York prison association by William Tallack, published in London 1871; and *Woman in Prison*, by Caroline H. Woods, is also extremely suggestive of the need of women's attention to prisons for women. State reports and reports of the American prison congresses give very fully the present condition of American prisons.

PRISREND', a t. of European Turkey (Albania), capital of a district, on the Rieka, 80 m. e. of Scutari. It is one of the most beautiful, rich, and industrious towns in Turkey, with a citadel situated upward of 1100 ft. above sea-level. It contains an immense number of bazaars, and carries on an active trade in flints, saddlery, glass, copper, and steel wares. Among its edifices are 15 mosques. Pop. 35,000.

PRISTINA, a t. of European Turkey, in the vilayet of Monastir, 30 m. n.n.e. of Prisrend, stands on a hill, and is the most considerable town in old Servia. Pop. 12,000.

PRISTIS. See SAW-FISH.

PRITHU is the name of several legendary kings of ancient India. It is, however, especially one king of this name who is the favorite hero of the Purānas. His father was Vena, who perished through his wickedness; for when he was inaugurated mon-

arch of the earth, he caused it to be everywhere proclaimed that no worship should be performed, no oblations offered, and no gifts bestowed upon the Brahmans. The Rishis, or saints, hearing of this proclamation, entreated the king to revoke it, but in vain; hence they fell upon him and slew him. But the kingdom now being without a king, as Vena had left no offspring, and the people being without protection, the sages assembled and consulted how to produce a son from the body of the dead king. First, then, they rubbed his thigh; from it, thus rubbed, came forth a being called Nishâda; and by this means the wickedness of Vena having been expelled, they proceeded to rub the right arm of the dead king, and by this friction engendered Prithu, who came forth resplendent in person, and in his right hand the mark of the discus of Vishnu, which proved him to be a universal emperor, one whose power would be invincible even by the gods. The mighty Prithu soon removed the grievances of the people; he protected the earth, performed many sacrifices, and gave liberal gifts to the Brahmans. On being informed that, in the interval in which the earth was without a king, all vegetable products had been withheld, and that consequently the people had perished, he in great wrath marched forward to assail the earth. The earth, assuming the figure of a cow, fled before him; but seeing no escape from the power of the king, at last submitted to him, and promised to renew her fertility, provided that he made all places level. Prithu therefore uprooted mountains, leveled the surface of the earth, established boundaries of towns and villages, and induced his subjects to take up their abode where the ground was made level. The earth now fulfilled her promise; and as Prithu, by thus granting her new life, became, as it were, her father, she was henceforth called Prithivi. However little the worth of this piece of popular etymology—for *prithivi*, or *prithvi*, "earth," the feminine of *prithu* (Greek *platu*), means etymologically "the large" or "wide"—the legend of Prithu itself seems to record some historical fact regarding the civilizing influences exerted by a great king of Hindu antiquity.

PRIVAS, a t. in France, 400 m. s.e. of Paris, in the department of Ardèche; pop. about 8,000; located on a branch of the railroad between Paris and Lyons. It manufactures raw silks, woolen blankets and other woolen goods, leather, and brandy, and exports iron ores. The town is located upon a ridge overlooking the valley of l'Ouvèze, at the foot of the mountains of Coiron, and has a fine esplanade, shaded with plane trees, overlooking a panorama of great extent and beauty.

PRIVATE, the title applied in the British army to a common soldier of the cavalry and infantry, the corresponding rank in the artillery being gunner or driver, and in the engineers the sapper. The pay of a private is one shilling a day in the infantry, and 1s. 2d. in the cavalry—exclusive of a free ration or corresponding allowance. A private in the cavalry is sometimes called a trooper.

PRIVATEER, a ship owned by a private individual, which, under government permission, expressed by a letter of marque (q. v.), makes war upon the shipping of a hostile power. To make war upon an enemy without this commission, or upon the shipping of a nation not specified in it, is piracy. Privateering was abolished by mutual agreement among European nations by the treaty of Paris in 1856. It is doubtful, however, how far that abolition would stand in a general war, for privateering is the natural resource of a nation whose regular navy is too weak to make head against the maritime power of the enemy, especially when the latter offers the temptation of a wealthy commerce.

PRIVATEER (ante). An effort was made at an early period by the government of the United States to have provisions in treaties with foreign countries which would abolish privateering in case of war; and the laws of the United States are more prohibiting in this respect than those of most other nations. At the time of the mutual agreement among European nations to abolish the custom, mentioned in the preceding paragraph, the government declared its willingness to unite with them provided a certain clause of the treaty was amended so that the private property of the subject or citizen of a belligerent on the high seas should be exempted from seizure by public armed vessels of the other belligerent, except it be contraband of war. But this was declined, and consequently no arrangement with the United States was included in the treaty.

PRIVET, *Ligustrum*, a genus of plants of the natural order *oleaceæ*, containing a number of species of shrubs and small trees with opposite leaves, which are simple and entire at the margin; the flowers small, white, and in terminal panicles; the calyx slightly 4-toothed; the corolla funnel-shaped and 4-cleft; the stamens two, projecting beyond the tube of the corolla; the berries 2-celled. **COMMON PRIVET** (*L. vulgare*) is a shrub growing in bushy places and about the borders of woods in the middle and s. of Europe, and in some parts of Britain, now also naturalized in some parts of North America. It has half-evergreen, smooth, lanceolate leaves; and berries about the size of peas, black, rarely white, yellow, or green. The flowers have a strong and sweetish smell; the leaves are mildly astringent, and were formerly used in medicine; the berries, which hang on the shrub during winter, have a disagreeable taste, but serve as food for many kinds of birds; they are used for dyeing red, and, with various additions, green, blue, and black. A rose-colored pigment obtained from them is used for coloring maps. The wood is hard, and is used by turners, and by shoemakers for making wooden pegs. Privet, although not spiny, is much used for hedges, often mixed with some spiny shrub,

or with beech. It bears clipping well, and grows well in the smoke of towns; also under the shade of trees.—A number of species of privet are natives of different parts of the east, and some of them have begun to be introduced into shrubberies in Britain.—All kinds of privet grow readily from cuttings.

PRIVILEGE (Lat. *privilegium*, from *privata lex*, a private law), a special ordinance or regulation, in virtue of which an individual or a class enjoys certain immunities or rights from or beyond the common provisions of the general law of the community. It differs from a *dispensation* inasmuch as the latter merely relaxes the existing law for a particular case or cases, while the privilege is a permanent and general right. Of ancient and mediæval legislation the law of privilege formed an important branch; and, in truth, the condition of the so-called "privileged classes" was in all respects different, socially, civilly, and even religiously, from that of the non-privileged. In canon law there were two privileges enjoyed by the clergy, which deserve special notice from the frequency of the historical allusions to them—the "privilege of the canon" (*privilegium canonicum*) and the "privilege of the forum" (*privilegium fori*). By the former the person of the clergyman, of whatever degree, was protected from violence by the penalty of excommunication against the offender; by the latter—known in England as "benefit of clergy" (q. v.)—the clergyman was exempted from the ordinary civil tribunals, and could only be tried in the ecclesiastical court. Most of the purely civil privileges are abolished throughout Europe by modern legislation.

PRIVILEGED DEBTS, in the law of Scotland, such debts as are first paid out of certain funds. Thus, when a man dies, a certain sum is allowed out of his estate for mournings (q. v.) to the widow and children. In case of bankruptcy servants' wages are privileged to a certain extent.—**PRIVILEGED DEEDS** are holograph deeds, which are exempted from the statute which requires other deeds to be signed before witnesses.

PRIVILEGES AND IMMUNITIES, a phrase found in art. 4, sec. 2, of the U. S. constitution: "The citizens of each state shall be entitled to all privileges and immunities of citizens in the several states," and in art. 14 of the amendments: "No state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States." Taken together, the provisions secure to each citizen the maintaining of all his rights of citizenship, and forbid the refusal by local authorities of equal advantages to all. The object of the first clause is to secure such general rights as redress in the courts of the foreign state, power to purchase and sell property, and privileges of transit. Thus, while the rights of the states in their proper limits are not interfered with, that uniformity of the conditions and privileges of life which pertain to a single nation is obtained. It is impossible to define the "privileges and immunities" which properly come within the meaning of the constitution, and the supreme court has declined to undertake their enumeration. A distinction is made between special privileges granted to citizens as a part of their citizenship, and enactments designed to confine trade or business by unequal taxation or otherwise. Where persons not having their domicile in a state were refused permission to sell goods by sample, trade-list, card, or catalogue, without the payment of a special license-fee, the statute was held to be unconstitutional, as imposing a discriminating tax. In the clause of the amendment above quoted the individual is looked on as a citizen of the United States, rather than of the state of his domicile. Thus it would be unconstitutional for a state to enact a law forbidding its citizens to have recourse to the U. S. courts in any class of cases. Every citizen has the right to enjoy the protection of the general government without disturbance, to use its courts and offices, to navigate its waters, and enter its ports, without restriction by his own or other states. The leading case on this subject is what is known as the *slaughter-house cases* (16 Wallace, 36). Here the Louisiana legislature gave to a certain corporation exclusive rights in maintaining slaughter-houses in the city of New Orleans. It was held by the supreme court that the exclusive right was not in its nature such a fundamental civil right as is included in the meaning of the phrase "privileges and immunities." Three judges dissented. It has also been held that the prohibition of the sale of liquor or its regulation is a matter of state legislation; that the right of a woman to practice law in the state courts did not depend on U. S. citizenship, and could not be enforced by U. S. courts, and that the right to vote is not of necessity a privilege belonging to all U. S. citizens.

PRIVY-CHAMBER, GENTLEMEN OF THE, officers of the royal household of England, instituted by king Henry VII., to attend on the king and queen at court, and in their progresses, diversions, etc. For a number of years past no services have been required of these officers, and no salary or fee is attached to the office. There are also four gentlemen ushers of the privy-chamber, who are in regular attendance on the sovereign, waiting in the presence-chamber, and attending on the royal person; they have the honor of conducting her majesty in the absence of the higher officers.

PRIVY-COUNCIL (*Consilium regis privatum*), an assembly of advisers on matters of state appointed by the sovereign. The privy-council of England existed at a very early period in the history of the country. It was in its beginning a small permanent committee, or minor council, selected by the king out of the great council, or parliament;

and in its powers were included—what still forms one of its functions—the right to inquire into all offenses against the state, and to commit offenders for trial before the proper courts of law. It also frequently assumed the cognizance of questions of private right, a practice against which the statute 16 Charles I. c. 10 was directed, enacting that neither king nor council should have any jurisdiction in matters regarding the estates and liberties of the subject, which should be tried in the ordinary tribunals of the country. The council, in early times, consisted of the chancellor, the treasurer, the justices of either bench, the escheaters, the sergeants, some of the principal clerks of the chancery, and other members nominated by the king, who were generally bishops, earls, and barons. The star-chamber and court of requests were both committees of privy-council. The number of members, which had originally been 12, was gradually increased; and when the large number had become inconvenient, the sovereign sought the advice of a select body of the more influential among them. Charles II. limited the number of counselors to 30, 15 of whom comprised the chief officers of state and the *ex-officio* members, to whom were added 10 peers and 5 commoners named by the sovereign; and it was intended that the council, thus remodeled, should practically resume its original duties, and have the control of every part of the executive administration. The court of privy-council has, however, long ceased to discharge the function of advising the crown on the general affairs of government and state policy, a select number of the body, under the denomination of the cabinet council, forming the recognized executive council of the crown. See **MINISTRY**. The list of privy-councilors now includes the members of the royal family, the archbishops of Canterbury and York, the bishop of London, the great officers of state, the lord chancellor and judges of the courts of equity, the chief-justices of the courts of common law, the ecclesiastical and admiralty judges, and the judge-advocate, several of the puisne judges, the speaker of the house of commons, the ambassadors, some of the ministers plenipotentiary and governors of colonies, the commander-in-chief, the master-general of the ordnance, the first lord of the admiralty, and generally also a junior lord of the admiralty, as well as necessarily all the members of the cabinet. The vice-president of the board of trade, the paymaster of the forces, and the president of the poor-law board are also generally members of the privy-council, and sometimes other persons who have filled responsible offices under the crown. It is now understood that no members attend the deliberations of council except those who are especially summoned. In ordinary cases, only the ministers, the great officers of the household, and the archbishop of Canterbury are summoned; but on some extraordinary occasion summonses are sent to the whole council—this was last done to receive her majesty's communication of her intended marriage. Meetings of council are usually held at intervals of three or four weeks at her majesty's residence, and the attendance of six privy-councilors at least, with one of the clerks of council, is considered necessary to constitute a council.

A privy-councilor must be a natural-born subject of Great Britain. The office is conferred by the sovereign's nomination, without any patent or grant, and completed by taking the oath of office. The duties of a privy-councilor, as defined by this oath, are, to the best of his discretion, duly and impartially to advise the king; to keep secret his counsel; to avoid corruption; to strengthen the king's council in all that by them is thought good for the king and his land; to withstand those who attempt the contrary, and to do all that a true councilor ought to do to his sovereign lord. The office of privy-councilor formerly fell by the demise of the crown; but by 6 Anne, c. 7, the privy-council continues to exist for six months longer, unless sooner determined by the successor. Immediately on the decease of the sovereign, the privy-council now assembles and proclaims his successor, the lord-chancellor affixing the great seal to the proclamation. The members of the privy-council are then resworn as council of the successor and take the oath of allegiance, after which a privy-council is held, and the sovereign makes a declaration of his designs for the good government of the realm, and subscribes the requisite oaths.

The king in council, or a committee of the lords of council, have been empowered by various statutes to issue orders which are to have the force of law, parliament thus delegating its authority to regulate such matters as may be more conveniently regulated by order in council. In cases of extreme public emergency, at a time when parliament was not sitting, orders in council have sometimes been issued in contravention of the existing law, and the indemnification of parliament has afterward been sought. See **ORDERS IN COUNCIL**. The sovereign, with the advice of the privy-council, is also empowered to issue proclamations, which, however, must be in accordance with, and in furtherance of, the law of the land. See **PROCLAMATION**.

Almost every act of importance done by the sovereign in person is performed in council—such as declarations of, or public engagements by, the sovereign, and consent to marriages by members of the royal family. Among the functions of the privy-council are also the appointment of sheriffs in England and Wales, and the issuing of orders for the laying on or removing of quarantine, or for granting reprisals, or for embargoes. The sovereign in council has still more ample authority in all that relates to the colonies, including the making and enforcing of laws in such colonies as have no representative assemblies, and approving or disallowing the legislative acts of such as do possess them.

A large part of the business of the privy-council is transacted by committees, to which petitions and other matters are submitted by the queen in council. Among the permanent committees of privy-council are the board of council for trade and foreign plantations (see TRADE, BOARD OF); the committee of council for education, appointed in 1839, to distribute the sum voted annually for educational purposes; and the judicial committee of privy-council. This last-named committee consists of the keeper of the great seal, the chief-justices, the master of the rolls, the chief baron, and other great judicial officers, with any two other privy-councillors who may be named by the sovereign. It was established by 3 and 4 Will. IV. c. 41, for the purpose of deciding certain questions of right or privilege, particularly with regard to the colonies, and hearing appeals in certain classes of cases, which, notwithstanding the above-cited act of Charles I., still fell under the jurisdiction of the privy-council. Among these are appeals from the courts of equity, colonial appeals, both at common law and in equity, as also those causes which, prior to its abolition by 2 and 3 Will. IV. c. 92, were reviewed by the court of delegates (see DELEGATES, COURT OF); as the supreme court of appeal in ecclesiastical and maritime cases. The powers of the judicial committee of the privy-council have been enlarged and regulated by 6 and 7 Vict. c. 38. The powers possessed by the general board of health, instituted by 11 and 12 Vict. c. 18, and 17 and 18 Vict. c. 95, are now, by 21 and 22 Vict. c. 97, vested in the privy-council. The acts of committees of the privy-council are designated acts of the lords of the council, in contradistinction from orders in council, made by the sovereign, who is personally present, by advice of the privy-council. The crown may refer to a committee of council any petition or claim of right for which the ordinary tribunals afford no remedy. The lords of council constitute a court of record for the investigation of offenses against the state, the offenders being committed for trial before the ordinary tribunals. Certain state investigations, not of a criminal kind, have also been held to fall within their jurisdiction, such as the inquiry into the insanity of George III., the claim of queen Caroline to be crowned as consort of George IV., and questions regarding illegal marriages of the royal family.

The privy-council is styled collectively "her majesty's most honorable privy-council." Privy-councillors are entitled to the designation "right honorable" prefixed to their name, and take precedence next after knights of the garter. The personal security of a member of privy-council was formerly guarded by certain statutes, visiting with fine a blow struck in his house or presence, and making it felony to conspire against him or assault him in the execution of his office; but these immunities were done away with by 9 Geo. IV. c. 31.

The lord president of the council is the fourth great officer of the state, and is appointed by letters-patent under the great seal. The office is very ancient, and was revived by Charles II. in favor of the earl of Shaftesbury.

Scotland possessed a privy-council, which was merged in that of England by 6 Anne, c. 6. There is a privy-council for Ireland, which at present consists of 58 members, who are sworn pursuant to a sign-manual warrant directed to the lord lieutenant.

PRIVY-COUNCIL (COMMITTEE OF) ON EDUCATION. Till within the last forty years primary education in England was left in the hands of individuals and societies. The only societies of importance which endeavored to overtake the enormous educational destitution which prevailed were the British and foreign school society, founded under the patronage of George III.; and the national society, of more recent date. The first-mentioned society endeavored to get rid of all religious difficulties by avoiding the use of catechisms in the school, and confining themselves to the use of the Bible alone. The church party, however, felt that in accepting for the children of the country a religious training so vague, they were untrue to their principles, and would probably fail to secure for the young any efficient religious instruction at all. Accordingly, the national society was set on foot as a specially church institution. The object of both these societies was, by means of contributions collected from benevolent persons, to aid in the foundation and maintenance of elementary schools throughout England and Wales.

The prevailing destitution was, however, too widespread to be met by voluntary associations, and it consequently became necessary that the state should take some share in the education of the people. Parliamentary grants of small amount were made, which were distributed by the treasury under regulations issued in 1833, the chief of which was as follows: "That no application be entertained by the treasury unless a sum be raised by private contribution equal, at least, to one-half of the total estimated expenditure." These grants were for the purpose of erecting school-buildings. In 1839, after considerable opposition, it was resolved to increase the parliamentary grant, and to appoint a committee of her majesty's privy-council to administer it. On June 3, 1839, an order of council laid down that the grants of previous years not yet appropriated, as well as the grant for the current year, should be expended for the erection of schools, and that £10,000 voted for normal schools in 1835 should be given in equal proportions to the British and foreign and the national societies. The privy-council committee did not at first contemplate aiding any schools but those in connection with the two societies which we have just named; but in September of 1839 they resolved to aid other schools, where special circumstances prevented their affiliation to the societies. In the course of a year or two it came practically to this, that *all schools were aided in which the Bible was daily read from the authorized version*,

The various religious denominations, under the influence, partly, of the strong pecuniary inducement held out by the committee of council, now began to exert themselves to erect schools, and to claim state aid. The committee of council, seeing the large probable increase in the number of schools requiring to be maintained partially out of the state funds, had their attention specially directed to the principles of their administration and the conditions on which alone aid was to be granted. The first measure of importance was the appointment of inspectors of schools. These were appointed by her majesty; but the church of England was permitted to exercise a veto on those nominated for the inspection of church schools, and the dissenting education committees were allowed a similar privilege with reference to those nominated for dissenting schools. No school was to be admitted to government aid in any form which did not declare its willingness to submit to inspection. The next measure of importance was the determining of the conditions on which aid should be given, first, for the erection, and, secondly, for the maintenance of schools. Grants for the former purpose were given in proportion to the number of children to be educated and the amount of money raised by private contribution.

In 1846 the first step seems to have been made toward making grants for the *maintenance* of schools. It was resolved to apprentice promising boys and girls, the young persons (who were to be at least thirteen years of age on appointment) giving assistance in the school-work, and receiving separate instruction for one hour and a half daily from the principal teacher.

They were paid salaries rising from £10 by annual increments of £2 10s. to £20. The teacher received a small extra payment for giving this instruction. The subjects were defined in a broad-sheet prepared by the department, and embraced Euclid, algebra, and the common subjects taught in schools. The apprenticeship was intended to be five years in length; but, in cases of exceptional ability, the period was considerably shortened. These young people were called "pupil-teachers."

In contemplation of the close of the apprenticeship of pupil-teachers, it was further resolved to grant them a scholarship or bursary, to enable them to pursue their studies at one of the numerous male and female normal schools which had come into existence; and at the conclusion of their training, to allow a grant of money to the normal school to which they had resorted. The queen's scholarship, as the bursary was called, was fixed at £25 for a first class, and £20 for a second, was tenable for two years; and the grants to the normal school at £20, £25, and £30, according as they had trained the student for one, two, or three years—two-thirds of these sums being allowed in the case of female students. It was further necessary to contemplate the completion of the normal-school training, and to endeavor to secure for the public service the well-trained teachers who had been educated at the public expense. Accordingly, it was resolved to grant to teachers sums ranging from £15 to £30 per annum (and two-thirds of these sums in the case of females), provided the school-buildings in which they taught, and the character of their teaching were satisfactory to her majesty's inspectors. A condition, afterward added, was, that the teacher should receive from local sources, including school-fees, not less than twice the amount paid by government, of which one-half should be from voluntary subscriptions. The amount which the teacher might claim, besides being payable only on the conditions stated above, was made partially dependent on the grade of certificate obtained at the normal school. Certificates are also granted on conditions specified in the code which is issued annually by the department.

What is known as "the new code" was introduced by Mr. Robert Lowe in 1862. It has undergone alterations every year; but it still continues to be founded on the principle of "payment by results." The teachers receive no direct payment from the department, but are left to make their own conditions with their managers. A grant is paid for every child's average attendance (6s.); and further payments are made for success in reading, writing, and arithmetic (3s. for each pass). To encourage a higher course of instruction, a further grant of 4s. on the average attendance is paid if the children are satisfactorily taught in two subjects (selected from geography, grammar, history, and needle-work); and extra sums are given for success in Latin, French, English literature, science, etc. The grants are paid to the managers, and the distribution is left entirely in their hands. Pupil-teachers must now be 14 years of age on appointment, and are apprenticed for not more than four years.

These are the principles of administration which continued to regulate the action of the privy-council, up to the date of the English education act of 1870, and the Scotch education act of 1872. The consequence has been an astonishingly rapid increase in the number of primary schools and normal schools or colleges; of the latter, there are about 40 in England and Scotland.

The above sketch of the privy-council system applies also to Scotland, with this difference, that when the revised code was first issued, the opportunity was regarded as a favorable one for considering whether there were not peculiarities in the educational system of Scotland, which might make it advisable either to separate educational administration there from that of England, or to found a national system on the basis of the time-honored system of parochial schools—excellent in themselves, but too few to supply the wants of the country. With these objects in view, a royal commission was issued in 1864, to take evidence on the whole question as it affected Scotland, and this

commission reported in 1868. The education act of Scotland has separated the public schools—and in some cases the burgh schools—from their connection with the ecclesiastical bodies of the country, and placed them in the hands of elected school-boards. Privy-council grants are now paid to these boards, since the passing of the last act.

The minutes of the privy-council committee, or, as it is now called, "the education department," are constructed under the education acts above referred to; but they do not materially differ in principle from the code of 1863. There was up to 1878 a Scotch educational department in London, with a board in Edinburgh; but the latter is now abolished, while the former has been strengthened with additional powers. The codes which regulate the elementary schools of England and Scotland are now almost identical; and the alterations made yearly seem to indicate the opinion of the department that the primary instruction of the whole country should be conducted on the same lines.

PRIVY-PURSE, KEEPER OF THE, an officer of the royal household charged with the payment of the private expenses and charities of the sovereign.

PRIVY SEAL, the seal appended to grants which are afterward to pass the great seal, and to documents of minor importance which do not require the great seal. The officer who has the custody of the privy seal was at one time called the keeper, and afterward the lord privy seal. As early as the reign of Edward III. he was a member of the king's council, and a responsible minister of the crown. The lord privy seal is now the fifth great officer of state, and has generally a seat in the cabinet. His office is conferred under the great seal during pleasure. Since the reign of Henry VIII. the privy seal has been the warrant of the legality of grants from the crown, and the authority for the lord-chancellor to affix the great seal. Such grants are styled letters-patent, and the office of the lord privy seal is one of the departments through which they must pass to secure their validity. Until recently, all letters-patent for the grant of appointments to office under the crown, of patents of invention, charters, naturalizations, pensions, creation of honors, pardons, licenses in mortmain, etc., required to pass from the signet office to the privy seal office, in the form of signet bills, verified by the signet seal and superscription, and the signature of the clerk of the signet. These signet bills were the warrant for the privy seal; and on the privy seal being attached to them they were forwarded to the lord-chancellor, by whom the patents were engrossed and completed in the office of the great seal. The statute 11 and 12 Vict. c. 62 abolished the signet office, and enacted that warrants under the royal sign-manual prepared by the attorney-general and solicitor-general, setting forth the tenor and effect of the letters-patent to be granted addressed to the lord-chancellor, and countersigned by one of the principal secretaries of state, should be a sufficient authority for the privy seal being affixed; and that the sign-manual so signed, countersigned, and sealed, should be sufficient warrant to the lord-chancellor to pass letters-patent under the great seal. This statute abolished the previously-existing offices of clerks of the signet and clerks of the privy seal.

There is a privy seal in Scotland, which is used to authenticate royal grants of personal or assignable rights. Rights, such as a subject would transmit by assignation, are transmitted by the sovereign under the privy seal.

PRIZE-COURT is a court which adjudicates the property in vessels captured at sea from a belligerent; and the rule is, that when a captor brings home a prize, the tribunal of his own country has jurisdiction to declare whether he is entitled to it, which decision is binding everywhere. A prize-court differs from other courts in this, that the property of foreigners is brought within its jurisdiction, not by consent, as is implied with regard to the ordinary municipal courts, but by force. By natural law, one would suppose that the tribunals of the captor's country are no more the rightful exclusive judges of captures in war, made on the high seas from under the neutral flag, than are the tribunals of the neutral country. Nevertheless, such is the rule of international law, which vests this jurisdiction in the prize-court. In Britain the court is created by commission under the great seal, and the judge of the admiralty court is usually appointed. Lord Stowell was the judge during the French war, and, during the time he sat as judge, delivered many important judgments in this difficult branch of the law.

PRIZE, PRIZE-MONEY, terms having reference to property captured from an enemy, or to enemy's property captured from a neutral in time of war. The circumstances under which such capture is justifiable are stated under CAPTURE, as regards naval operations; military prize and its distribution to the army are described under BOOTY. It remains only, therefore, to notice the procedure taken in respect to vessels and property captured by the navy. On a ship being taken, she must be sent to a port belonging to the capturing power, where the court of admiralty, on full evidence, adjudicates whether she be lawful prize or not. If the decision be affirmative the prize is then sold; or if a ship-of-war, a certain allowance per gun is granted by the state. The produce of the sale or grant is lodged in the hands of the accountant-general of the navy for distribution to the officers and men who assisted at the capture. The net produce of the sale or grant is first divided ratably among any ships (if there be more than one) concerned in the capture. The share of each ship is then divided into eight equal parts. If she were employed under the orders of a flag-officer, he gets one-eighth, and the captain two-eighths; if not, the captain has three-eighths; one-eighth is divided among the lieutenants and officers of corresponding relative rank; one-eighth is shared by the

junior commissioned officers and warrant officers; one-eighth goes to the midshipmen and petty officers; and the remaining two-eighths among the seamen, marines, and boys.

PRIZE, PRIZE-MONEY (*ante*). The main causes for condemning a ship whose nationality is doubtful are the want, falsification, or destruction of the ship's papers; suspicious conduct of the ship's officers, or their refusal or inability to give a satisfactory account of the ship or cargo. A ship is presumed to belong to the nation whose flag it carries. Where a capture is made by one ship belonging to a squadron, all ships belonging to the squadron are entitled to share in the prize, whether they were in sight or not; and all ships of war unattached to a squadron share in a prize made by another ship of war in sight. Formerly captors secured title by keeping possession of the captured property 24 hours, and recaptors of it after that time got an absolute ownership. At present recaptors have only a right to salvage. It is doubtful if the crew of a vessel who recapture it before it is condemned are entitled to salvage. In the United States they are probably not so entitled. By the U. S. neutrality laws, established 1793, no armed vessel of a foreign belligerent is allowed to follow a vessel of another belligerent out of a U. S. harbor within 24 hours.

Prize-money is distributed in the United States in accordance with the provisions of the act of June 30, 1864, sec. 10. This statute directs that where the prize is equal or superior in force to the capturing vessel or vessels, the captors shall have the whole; where it is inferior in force, the captors shall have half, and the United States the other half. In the cases of letters of marque and privateers, the captors shall have the whole, unless otherwise stipulated in the commissions issued to such vessels. Prize-money decreed to captors shall be distributed in the following order: 1. To the officer commanding the fleet or squadron $\frac{3}{5}$ of the prize-money decreed to any vessel under his immediate command. 2. To the commanding officer of a division of a fleet or squadron on duty under orders of the commander-in-chief of such fleet or squadron, a sum equal to $\frac{1}{5}$ of the prize-money awarded to any vessel of his division for a capture made while under his command, said $\frac{1}{5}$ to be deducted from the $\frac{1}{2}$ due the United States, if such $\frac{1}{2}$ be due, and if not, from the sum decreed to the captors. Said $\frac{1}{5}$ is not to be added to the share such commander may be entitled to, and may take, instead, as commander of a single vessel, making or aiding in the capture. 3. To the fleet captain $\frac{1}{10}$ part of all prize-money decreed to any vessel or vessels in the squadron to which he is attached, unless the capture be made by the vessel to which he is attached when such capture is made. In that case he is to share, in proportion to his pay, with the other officers and men serving on such ship, according to subsequent provisions. 4. To the commander of a single vessel, $\frac{1}{10}$ of all prize-money decreed to such vessel under his command, if such vessel, at the time the capture was made, were under the command of the commanding officer of a fleet, squadron, or division, and $\frac{3}{5}$ if such vessel were not under the command of such superior officer, but acted independently. 5. After the deductions above mentioned, the residue shall be distributed in proportion among all those on duty (including the fleet captain), on board, and put on the ship's books proportionate to their respective rates of pay in the service. No commanding officer of a fleet or squadron is entitled to any share in a prize captured by any vessel or vessels not under his command, nor in any prize made by any vessel or vessels, which it was intended to place under his command, but which, at the time the capture was made, were not actually under his orders. No commanding officer of a fleet or squadron, who has left the station where he commanded, shall be entitled to any share in such prizes as may be made remaining in the station where he commanded, after he has left such station, nor after the command of such station has been assumed by his successor. No officer or other person, temporarily absent on duty from a vessel upon whose books his name remains, during his absence shall be deprived, on account of such absence, of any prize-money to which he would otherwise be entitled; but shall share in all prizes made by the vessel to which he is attached, until he is regularly discharged. See **BLOCKADE, CONTRABAND, NEUTRALITY, PRIVATEER**.

PRIZZI, a t. of Sicily, in the province of Palermo, and 30 m. s. by e. from Palermo. It is of considerable commercial importance. Pop. '71, 8,835.

PROA, commonly known as the "flying proa," is a peculiarly-shaped canoe in use by the natives of the Eastern archipelago, and especially by the Ladrone pirates. It is about 30 ft. in length by 3 in width, and has the stem and stern equally sharp, so as to sail backward or forward without being turned round. One side is flat, and in a straight line with the stem and stern; the other side is rounded as in ordinary boats. This peculiar formation would make it liable to be easily upset, were it not for a framework which projects to windward, supporting a weight which counterbalances the pressure of the wind on the sail. The sail resembles the ordinary lug-sail, and is formed of mat. Slight variations from this form are found, but the principle of construction is the same.

PROB'ABILISM (Lat. *probabilismus*, a barbarous technical word, from *probabilis*, probable), in Roman Catholic theology, means the doctrine regarding the use of so-called "probable opinions" in guiding the conscience as to the lawfulness or unlawfulness of any particular action. The word came prominently into discussion in the 17th c., and seems now fully accepted as a technical name. As the ground of the doctrine, it is assumed

that, in human actions, absolute certainty is not always attainable as to their lawfulness or unlawfulness. Short of this certainty, the intellect passes through the stages of "doubt" and of "probability." In the former, it is swayed between conflicting views, so as to be unable to decide, or even to approach toward deciding, what is true. In the latter, although there is a conflict of views, yet the reasons in their favor are not so equal that the intellect cannot see preponderating motives in favor of the truth of one or of the other. Moreover, in the conflict of views, another element will arise, as to their comparative "safety," that is, the greater or less danger of moral culpability which they involve; and this greater or less moral "safety" of a view may, or may not, coincide with its greater or less "probability." The doctrine of "probabilism" is founded upon these distinctions; and it presents itself in four different schools, all of which agree in professing that it is lawful, in certain cases, to act upon opinions which are merely "probable." Opposed to all these four, is the school of *anti-probabilism*, which rejects altogether the use of probable opinions, and requires that an opinion shall be absolutely morally certain, in order that it may be lawful to act upon it. The four schools of probabilism are called: *probabilism simple*, *aqui-probabilism*, *probabiliorism* (from *probabilior*, more probable), and *tutorism* (from *tutor*, more safe). The first holds that it is lawful to act upon any probable opinion, no matter how slight its probability. The second requires that the opinion shall be "solidly probable," but holds that, provided it be really probable, it is lawful to act upon it, even though the conflicting opinion should be equally probable. The third, in the conflict of probable opinions, will only permit us to act on the more probable of the two; but permits this even when the less probable adverse opinion is the "more safe." The fourth requires that in all cases the more safe opinion shall be followed, even when the less safe opinion is much the more probable. It is commonly said that the system of probabilism is modern; but this is only true of the discussions regarding it, for the doctrine itself, in some of its forms, is as old as the study of ethics, even considered as a moral science. The disputes regarding it arose with the science of casuistry, when men, in the 16th and 17th centuries, began to reduce morals to a system. It formed a leading subject of the controversy between the Jesuits and the Jansenists, although it is a great, while it is a very common, mistake to suppose that all the Jesuits were probabilists, and that all the Jansenists were opposed thereto. Very few Jesuits, indeed, were of the school which is chiefly assailed in the *Provincial Letters* (see PASCAL), that of probabilism simple. Without entering into the history of this very curious controversy, it will be enough to say that the Roman church, while condemning the two extremes—the extreme of anti-probabilism, which excludes all use even of the most probable opinions, and the lax extreme of simple probabilism, which accepts even the slightest probability as sufficient—has left the intermediate opinions for free discussion. The great modern master on the subject is St. Alfonso da Liguori, whose system may be described as a kind of practical probabiliorism, in which, by the use of what are called reflex principles, an opinion which *objectively* is but probable, is made *subjectively* the basis of a certain and safe practical judgment. There can be no doubt that the system of probabilism has been pushed by some individual divines to scandalous extremes; but it is only just to add that these extremes have been condemned by authority in the Roman church; and that, on the other hand, the principles of the higher Roman schools of probabilism are substantially the same as those of all moralists, whether of the old or of the new schools of ethics.

Protestants, however, and with them some Roman Catholics, reprobate probabilism in all its *schools* or forms, as a mere scheme for the delusion of conscience and excuse or justification of immorality. They maintain the Scriptural or Christian rule, and the only rule of true morality, to be that no man is entitled on any account to do that of which he doubts whether it is contrary or agreeable to the law of God. Every man must often choose between two courses, as to which is the most expedient; but this they hold to be a totally different thing. It is also urged against the probabilists, that they make the authority of *doctors*, or learned theologians, sufficient justification for a man's doing that which otherwise he would deem it unlawful to do; asserting that it will keep him safe at the judgment seat of God.

PROBABILITY, THE MATHEMATICAL THEORY OF. Of all mathematical theories which can be made in any sense popular, this is perhaps the least generally understood. There are several reasons for this curious fact, of which we may mention one or two. *First*.—As by far the simplest and most direct elementary illustrations of its principles are furnished by games of chance, these have been almost invariably used by writers on the subject; and the result has been a popular delusion, to the effect that the theory tends directly to the encouragement of gambling. Nothing can be more false than such an idea. Independent of moral considerations, with which we have nothing to do here, no arguments against gambling can be furnished at all comparable in power with those deduced from the mathematical analysis of the chances of the game. *Second*.—In many problems, some of them among the easiest in the theory, the very highest resources of mathematics are taxed in order to furnish a solution. One reason is very simple. The solutions, however elementary, involving often nothing but the common rules of arithmetic, sometimes lead to results depending upon enormous numbers, and very refined analysis is requisite to deduce *easily* from these what would otherwise involve calcula-

tions, simple enough in character, but of appalling labor. Higher mathematics here perform, in fact, something analogous to *skilled labor* in ordinary manufactures. The simplest illustration of this is in the use of LOGARITHMS (q.v.), which reduce multiplication, division, and extraction of roots to mere addition, subtraction, and division respectively. Powerful as logarithms are, analysis furnishes instruments almost infinitely more powerful. The large numbers which occur in probabilities are usually in the form of *products*, and we may exemplify the above remarks as follows.

To find the value of the product 1.3.5.7, no one would think of using anything but common arithmetic; but if he were required to find the value of 1.3.5.7.9.....49, he would probably have recourse to logarithms, *merely to avoid useless labor of an elementary kind*. But in very simple questions in probabilities, it may be requisite to find (approximately) the value of a product such as 1.3.5.7.9.....23999—i.e., that of the first 12,000 odd numbers. No one in his senses would dream of attempting this by ordinary arithmetic, but it is the mere labor, not the inherent difficulty, which prevents him. Few would even attempt it by means of logarithms; for, even with their aid, the labor would be very great. It is here that the higher analysis steps in, and helps us *easily* to a sufficiently accurate approximation to the value of this enormous number. Thus, it appears that this objection to the study of the theory of probabilities is not applicable to their principles, which are very elementary, but to the mere mechanical details of the processes of solution of certain problems. *Third*.—There are other objections, such as the (so-called) religious one, that “there is no such thing as chance,” and that “to calculate chances is to deny the existence of an all-ruling Providence,” etc.: but, like many other similar assertions, these are founded on a total ignorance of the nature of the science; and, therefore, although pernicious, may be safely treated with merited contempt. The authors of such objections remind us of the Irishman who attempted to smash Lord Rosse’s great telescope, because “it is irreligious to pry into the mysteries of nature.”

It appears to us that the best method of explaining the principles of the subject within our necessarily narrow limits, will be to introduce definitions, etc., as they may be called for, in the course of a few elementary illustrations, instead of elaborately pre-mising them.

First Case.—The simplest possible illustrations are supplied by the common process of “tossing” a coin, with the result of “head” or “tail.” Put H for head, and T for tail. Now, the result of one toss, unless the coin should fall on its edge (which is practically impossible), *must* be either

H or T.

Also, if the coin be not so fashioned as to be more likely to fall on one side than the other (as, for instance, is the case with loaded dice), *these events are equally likely*; or, in technical language, *equally probable*. To determine numerically the likelihood or the probability of either, we must assign some numerical value to *absolute certainty*. This value is usually taken as *unity*, so that a probability, if short of absolute certainty, is always represented by a proper fraction. Suppose that p (a proper fraction) represents the probability of H, then evidently p is also the probability of T, because the two events are equally likely. But one or other *must* happen; hence, the sum of the separate probabilities must represent certainty. That is,

$$p + p = 1, \text{ or } p = \frac{1}{2}.$$

Thus we have assigned a numerical value to the probability of either H or T, by finding what proportion each bears to certainty, and assigning to the latter a simple numerical value.

Suppose, as a contrast, the coin to be an unfair one, such as those sometimes made for swindling purposes, with H on each side. Then we *must* have in one toss

H or H;

i.e., H is *certain*, or its probability is 1. There is no possibility of T, and therefore its probability is 0. Absolute impossibility is therefore represented by the numerical value of the probability becoming zero.

Second Case.—Suppose a “fair” coin to be tossed twice in succession. The event *must* be one of the four:

H, H; H, T; T, H; or T, T.

Now all four are evidently equally likely: i.e., their probabilities are equal. But one of them *must* happen—hence the sum of their probabilities amounts to certainty, or 1.

That is, each of the four cases has a probability measured by the fraction $\frac{1}{4}$.

Here we may introduce a new term. What are the *odds* against H, H? The answer is, the chance or probability of H, H is $\frac{1}{4}$; that is, *one* case in *four* is favorable, hence

three are unfavorable, and the odds are said to be 3 to 1 against the event. *In general the odds against any event is the ratio of the probability that it will not, to the probability that it will, happen.*

Thus, in the first case above, the odds against H in one toss are even.

Third Case.—What is the chance of throwing both head and tail in two tosses of a

coin? Remark that this is *not* the same question as, "What is the chance of head followed by tail, in two tosses?" The latter question was answered in the *second case*, for the chance of H, T was there shown to be $\frac{1}{4}$. The present event contemplates *either* H, T, or T, H—and its probability is therefore $\frac{1}{4} + \frac{1}{4}$, or $\frac{1}{2}$, since each has the separate probability $\frac{1}{4}$. Or we may reason thus: Of the four possible cases of two tosses of a coin, *two* give both head and tail—all *four* are equally probable—hence the probability is 2 in 4, or 1 in 2; i.e., $\frac{1}{2}$.

Fourth Case.—What is the chance of throwing H in two tosses? Remark that this is *not* the same question as "What is the chance of H *once only* in two tosses?" The latter question is that of the third case merely put in a different form. Nor will it do to answer our question thus:

$$\text{Chance of H in first throw} = \frac{1}{2}.$$

$$\text{Chance of H in second throw} = \frac{1}{2}.$$

Therefore chance of H in two throws = $\frac{1}{2} + \frac{1}{2} = 1$. For by this reasoning it would appear that we *must* get head once at least in two throws; which is obviously absurd, for we may have T, T.

This very elementary example shows how delicate the reasoning in this subject is, and how liable one is to make (complacently) the most preposterous mistakes.

The error of the above process is introduced by the fact that we have not considered that *if H be obtained in the first throw, our object is attained, and no second throw is required*. The correct work is this:

$$\text{Chance of H in first throw} = \frac{1}{2}.$$

If H come, the game is finished.

$$\left. \begin{array}{l} \text{Chance of T in the first throw, in which case we must throw again,} \\ \text{Subsequent chance of H in second throw} \end{array} \right\} = \frac{1}{2}$$

Combining these, we have:

$$\text{Chance of H at second throw only} = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}.$$

$$\text{Add chance of H at first throw} = \frac{1}{2}.$$

$$\text{Sum, or chance of H in two throws} = \frac{3}{4}.$$

A simpler method is this: The possible throws, all equally likely, are, as before, H, H; H, T; T, H; and T, T.

The first three of these satisfy the requirements of the question; i.e., the required event has 3 chances in 4 in its favor, or its probability is $\frac{3}{4}$.

Fifth Case.—The chance of H in any one throw is $\frac{1}{2}$ (by *first case*). The chance of H, H is $\frac{1}{4}$ (*second case*). Now $\frac{1}{4} = \frac{1}{2} \times \frac{1}{2}$; i.e., the chance of the *joint occurrence* of two *independent events*, at least in this simple case, is the *product of their separate probabilities*. Contrast this with the principle, already several times employed, that the *probability of an event which may arise from one of a number of causes (no two of which can co-exist) is the sum of the separate probabilities*. Simple proofs of these statements, in all their generality, will now be given, along with various other important propositions.

(A.) If an event may occur in p ways, and fail in q ways—all being equally likely—the probability of its happening in one trial is $\frac{p}{p+q}$, and of its failing, $\frac{q}{p+q}$, and the odds in its favor are $p : q$.

The simplest way of conceiving this, and many other hypothetical cases, is to suppose *one* ball to be drawn from a bag which contains a number of balls, differing from each other in color, or in some other quality not distinguishable by the touch. Suppose the bag to contain p white balls (W), and q black ones (B), and *one* ball to be drawn; what is the chance of its being white?

Here there are p chances in favor of a white ball being drawn, and q chances against it—these being *all equally likely*, or having *equal probabilities*—the chance of W is therefore p in $p + q$; i.e., is expressed by the fraction,

The chance against W is $\frac{p}{p+q}$, or $\frac{q}{p+q}$.

And the sum of these fractions is 1, or certainty, as it ought to be—for the ball drawn *must* be either W or not W.

(B.) If an event may occur in p ways and fail in q ways, all being equally likely—what are the chances of (a) its happening twice, (b) its happening the first and failing the second, (c) its failing the first time and happening the second, and (d) its failing twice in two trials?

Taking the illustration in (A) above, we see that there are p independent ways of succeeding in the first case, and p in the second; hence there are $p \times p$, or p^2 independent ways of *succeeding* twice. For any one of the first p may occur along with any one of the second. But the whole possible number of ways of experimenting twice is $(p+q)(p+q)$, or $(p+q)^2$; hence, the

Chance of (a) i.e., succeeding twice, is $\frac{p^2}{(p+q)^2}$.

Similarly, chance of (b) is $\frac{pq}{(p+q)^2}$.

“ “ (c) is $\frac{qp}{(p+q)^2}$.

“ “ (d) is $\frac{q^2}{(p+q)^2}$.

The sum of these is $\frac{p^2 + 2pq + q^2}{(p+q)^2} = 1$, as it ought.

(C.) An attentive consideration of (B) shows us that when we have the independent probabilities of two events, the probability that they will jointly occur is the *product* of their separate probabilities.

Thus, for W, in first trial, chance is $\frac{p}{p+q}$.

“ “ second “ $\frac{p}{p+q}$.

Whose product is the probability of W in each of two successive trials.

Again, for W, in the first trial, chance is $\frac{p}{p+q}$.

“ B, “ second “ $\frac{q}{p+q}$.

Whose product is $\frac{pq}{(p+q)^2}$; which is found above to be the chance of WB. And so on.

(D.) This may be generalized as follows—the process will be evident to all who can understand the very elementary algebra employed:

$$\text{Certainty} = 1 = \frac{(p+q)^n}{(p+q)^n} = \frac{p^n + np^{n-1}q + \frac{n \cdot n-1}{1 \cdot 2} p^{n-2}q^2 + \dots + q^n}{(p+q)^n}$$

by the binomial (q.v.) theorem of Newton. Now the *parts* of this expression—i.e.,

$$\frac{p^n}{(p+q)^n}, \frac{np^{n-1}q}{(p+q)^n}, \dots, \frac{q^n}{(p+q)^n}$$

represent, obviously, the chances of W n times, W $n-1$ times and B once, W $n-2$ times and B twice,, B n times, in n trials, where the *order* of occurrence is not considered.

If the *order* be considered, the chance of any arrangement, such as WBWBBBBW, for instance, is evidently

$$\frac{p \cdot q \cdot p \cdot p \cdot q \cdot q \cdot q \cdot p}{(p+q)^8} = \frac{p^4q^4}{(p+q)^8}$$

But the chance of 4W and 4B in 8 trials, *without respect to order*, is as above, the term containing p^4q^4 in the expansion of $(p+q)^8$, divided by $(p+q)^8$ —i.e.,

$$\frac{70 p^4q^4}{(p+q)^8}$$

To take a simple example: if there be 2W and 1B in a bag, and each ball be placed immediately after drawing, the chance of W 4 times in succession is $\frac{2^4}{3^4} = \frac{16}{81}$.

Of the particular combination WBWB, the chance is $\frac{2 \cdot 1 \cdot 2 \cdot 1}{3 \cdot 3 \cdot 3 \cdot 3} = \frac{4}{81}$.

But the chance of W twice and B twice, *without respect to order*, is $6 \frac{2^2 \cdot 1^2}{3^4} = \frac{24}{81}$; the numerator of the fraction being the term of $(2 + 1)^4$ which contains the product $2^2 \cdot 1^2$.

(E.) From the preceding results it is obvious that the *probability of the joint occurrence of any set of independent events is the product of their separate probabilities.*

(F.) We may vary the process by supposing that there are *several* bags, each containing some balls, which may be white or black; but the number in each bag, and the proportion of white to black, being any whatever. *One ball only is to be drawn, what is the chance that it is W?*

If n be the number of bags, the chance that the ball will be drawn from any particular bag is $\frac{1}{n}$ [see (A)]. And if in that bag there be p of W and q of B, the chance that W will be drawn from it is $\frac{p}{p+q}$ [see (A)].

Hence the chance that W is drawn, and from the particular bag, is,

$$\frac{1}{n} \cdot \frac{p}{p+q} \text{ by (E).}$$

And the whole chance that W is drawn is the sum of all the chances, $\frac{1}{n} \cdot \frac{p}{p+q}$, for each of the bags.

Thus, let there be 5 bags, containing, respectively, WB, WW, BB, WWB, WWW; our chance is found as follows: The chance of the ball being drawn from any particular bag is $\frac{1}{5}$, since all are equally likely to be chosen. Then, supposing the first chosen, the

chance of W is $\frac{1}{2}$; if the third be chosen, the chance of W is 0, etc. Hence, on the whole, the chance of W is

$$\frac{1}{5} \cdot \frac{1}{2} + \frac{1}{5} \cdot 1 + \frac{1}{5} \cdot 0 + \frac{1}{5} \cdot \frac{2}{3} + \frac{1}{5} \cdot 1 = \frac{19}{30}.$$

(G.) Hence, *if an event may happen in consequence of any one of a set of causes, such that the action of one excludes that of the others; its probability is the sum of the products formed by multiplying the chance of the action of each cause by the chance that that cause, if operating, will produce the desired event.*

We might easily extend this very simple series of results, but our limits restrict us to an attempt to show more the *extent* of the subject than the details of its application to any particular set of questions. We therefore reluctantly pass to the consideration of an *inverse* problem or two.

(H.) An event has occurred, which may have arisen from any one of a set of mutually exclusive causes; to determine the probability that any particular cause was the efficient one—the probability of the event's happening, when any particular one of the causes operates, being known.

As a simple example will show us how to proceed in the most general case, take the 5 bags of (F) above. The chances of drawing W from them are, in order, $\frac{1}{2}, 1, 0, \frac{2}{3}, 1$.

Suppose W has been drawn, what is the chance that it was drawn from any particular bag? It is obvious that the chance of W having been drawn from any particular bag is proportional to the chance that, if that bag had been selected, W would have been drawn from it. Hence, if p_1, p_2, p_3, p_4, p_5 be the chances that the several bags furnished the W actually drawn, we have

$$p_1 : p_2 : p_3 : p_4 : p_5 :: \frac{1}{2} : 1 : 0 : \frac{2}{3} : 1,$$

with the additional condition that the ball *must* have been drawn from one of the bags, and therefore

$$p_1 + p_2 + p_3 + p_4 + p_5 = 1.$$

From these, by elementary algebra, we have

$$p_1 = \frac{3}{19}, p_2 = \frac{6}{19}, p_3 = 0, p_4 = \frac{4}{19}, p_5 = \frac{6}{19}.$$

And a very simple application of algebra will easily conduct us to the general formula for any such case.

(I.) If the nature of a cause is known only by its results, we have an interesting case of simultaneous application of the direct and inverse methods.

Thus a bag contains 3 balls, each of which may be either black or white. A ball has been drawn from it on two occasions—replacing before drawing—and on each of these occasions the ball was W. What is the chance that a third drawing will give a *black* ball?

The contents of the bag are obviously one of the following—viz., W, W, W; W, W, B; or W, B, B—since it contains *one* W at least. Now if WWW be the contents, the probability of the observed event (two W in succession) is $1 \times 1 = 1$.

If W, W, B, $\frac{2}{3} \times \frac{2}{3} = \frac{4}{9}$.

If W, B, B, $\frac{1}{3} \times \frac{1}{3} = \frac{1}{9}$.

Hence the probabilities that these are respectively, the contents of the bag are as $1 : \frac{4}{9} : \frac{1}{9}$, or as $9 : 4 : 1$; and are therefore $\frac{9}{14}$, $\frac{4}{14}$, and $\frac{1}{14}$ respectively, since their sum must be 1 or certainty.

Now for the chance of B in the third drawing; if WWW be the contents (of which the chance is $\frac{9}{14}$), the chance of B is 0. Hence we have one part of the chance for B, viz., $\frac{9}{14} \times 0 = 0$. Similarly, the other parts are $\frac{4}{14} \times \frac{1}{3} = \frac{4}{42}$, and $\frac{1}{14} \times \frac{2}{3} = \frac{2}{42}$. The whole chance of B in the third drawing is therefore

$$0 + \frac{4}{42} + \frac{2}{42} = \frac{1}{7}.$$

As exercises on the above principles, we will take first a few simple questions from life assurance, the subject to which, above all others, the elementary theory of probability has been of the most indispensable service. We purposely choose the very simplest that the subject can furnish, but they are quite sufficient to show the great value of the theory.

A table of mortality (q.v.) gives the numbers alive, at each successive year of their age, out of a given number of children born. If A_n and A_{n+1} be the numbers in the table corresponding to the n th and $n+1$ th years of age; the inference from the table is, that of A_n individuals now alive, and of n years of age, A_{n+1} will live one additional year at least. Hence, the chance that any one of them die during the year is

$$\frac{A_n - A_{n+1}}{A_n}.$$

Call this $1 - p$, then p is the chance that any one of them will survive the year.

Questions.—Of two individuals, one n years old, and the other n_1 , what are the chances that

- (a.) Only one lives a year?
- (b.) One, at least, lives a year?
- (c.) Both do not live a year?

Calling the individuals A and B, the chance of A living out the year is p , and the chance of dying within the year is $1 - p$. For B these are p_1 and $1 - p_1$. Hence

- (a.) A lives and B dies—chance $p(1 - p_1)$.
- B lives and A dies—chance $(1 - p)p_1$.

Hence answer to (a) is $p + p_1 - 2pp_1$.

(b.) This includes, in addition to the conditions of (a), the chance that both survive, which is pp_1 .

Hence answer to (b) is $p + p_1 - pp_1$.

(c.) In this case the chance that both do live a year is pp_1 . Hence chance of (c) is $1 - pp_1$.

As another very instructive example, let us take the question,

“In how many throws of a die is it even betting that an ace will be thrown?”

This may, of course, be worked directly, proceeding in the following manner:

$$\text{Chance of ace in first throw} = \frac{1}{6}.$$

Then, remembering that there is no second throw unless the first fails,

$$\text{Chance of ace in second throw} = \frac{5}{6} \times \frac{1}{6}; \text{ and so on.}$$

Hence the odds against ace in 1 throw are 5 : 1.

“ “ “ “ 2 throws 25 : 11;

and so on. But great care is requisite in this mode of working the problem.

The simplest procedure is this:

Chance against ace in 1 throw	5
	<u>6</u>
“ “ “ 2 throws	25
	<u>36</u>
“ “ “ 3 “	125
	<u>216</u>
“ “ “ 4 “	625
	<u>1296</u>

Hence odds against ace in 1 throw 5 : 1.

“ “ “ 2 throws 25 : 11.

“ “ “ 3 “ 125 : 91.

“ “ “ 4 “ 625 : 671.

That is, the odds are considerably *against* ace occurring in 3 throws, being about 11 to 8; while in 4 they are slightly in its favor, as 29 : 27 nearly. One is sure, therefore, of winning in the long run, if he can get any one to give him repeatedly an even bet against ace appearing in 4 throws of a die.

It is to be observed that when we say "*in the long run*," we mean that the most likely event may not be that which will happen in the first trial, nor perhaps for many trials (because, unless its probability is 1 or certainty, it is, of course, *possible* that it may never occur). But what is certain is this, that if a sufficient number of trials be made, we can have any amount of probability (short of certainty) that the ratio of the number of successful trials to the number of failures, will be in the ratio expressed by the odds in favor of success in any one trial.

And this introduces us to another department of the theory of probabilities, what is called *expectation*. We begin with a simple case, not involving what is called *moral expectation*, to which the next example will be devoted.

Suppose A, B, and C have made a pool, each subscribing £1; and that a game of *pure chance* (i.e., not dependent on skill) is to be played by them for the £3. What is (previous to play) the value of the expectation of each? By the conditions, all are equally likely to win the pool, hence its contingent value must be the same to each; and, obviously, the sum of these values must represent the whole amount in question. The worth of the expectation of each is therefore £1. That is, if A wishes to retire from the game before it is played out, the fair price which B or C ought to pay him for his share is simply £1. But this is obviously $\frac{1}{3} \times £3$; i.e., the value of the pool multiplied by his chance of getting it. Here we have taken an extremely simple case, because we have not room for the general proof (though it is closely analogous to that just given) that

The value of a contingent gain is the product of the sum to be gained into the chance of winning it.

So far, it has been assumed that the payment of his stake (which may be wholly lost) has not *morally* affected the position of any of the players; i.e., that the stake is a sum whose loss would in no wise embarrass him. And it is only with such cases that the strict mathematical theory can deal; for we cannot estimate with mathematical accuracy the value of the stake as depending on the fortune (the *possessions*, not the *luck*) of the player. The attempts which have been made to supply this apparent deficiency in the theory have, of course, not been very generally accepted. Still there is no doubt that two men of very unequal fortunes are placed in very different circumstances when they have subscribed equal sums to a pool which they have equal chances of gaining. The most commonly received method of *approximating* to a solution of such a question (for it is obvious that here we have left mathematical certainty behind) is that proposed by Daniel Bernoulli; which is, that the value of a small gain, or the inconvenience of a small loss, is directly proportional to the amount of the gain or loss (which is probably correct), and inversely proportional to the fortune of the person affected (which may be nearly true, except in very extreme cases). The application of this hypothetical principle necessitates, in general, the use of the integral calculus; but, to show the *mathematical folly* of gambling, we quote one of Bernoulli's results:

A, whose whole fortune is £100, bets £50 even with B on an event of which the chance is $\frac{1}{2}$. What is the moral value of A's fortune after making the bet (and before it is decided)? By applying the above method, he finds it to be £87. Thus A, by making the bet, has depreciated by 13 per cent the value of his property. This is an extreme case, of course; and the method employed in obtaining the result is questionable; still, it is certain that no legitimate method could show that A had otherwise than impaired his fortune by entering upon any such transaction. This, of course, is on the supposition that the bet is a *fair* one; if A be a swindler, and get from B more than the proper odds against the event, he may, of course, improve to any extent the value of his fortune. But such would be a question of flats and sharpers, not a question of probability.

A very excellent example of *moral* as distinguished from *mathematical* probability is furnished by the famous "St. Petersburg problem."

A and B play at heads and tails. A is to pay B £2 if H comes at the first throw, £4 if at the second and not before, £8 if at the third, and not before; and so on, doubling each time. What should B pay (before the game) for his expectation?

Applying the mathematical method we see that

$$\text{Chance of H at first throw} = \frac{1}{2};$$

in which case B gets £2, of which the contingent value is $\frac{1}{2} \times £2 = £1$.

$$\text{Chance of H at second throw, and not before} = \frac{1}{4};$$

when B is to get £4, whose value is therefore $\frac{1}{4} \times £4 = £1$.

Chance of H at third throw, and not before = $\frac{1}{8}$;

contingent value of B's £8 is therefore $\frac{1}{8} \times £8 = £1$. And so on, forever.

Hence B's expectation (mathematical) is $£1 + £1 + £1 + \text{etc.}$, forever, or an infinite sum. Now it is obvious that no man in his senses would pay even a moderately large sum for such a chance. Here the *moral* expectation comes into play; but the mathematical solution is perfectly correct, if we interpret it properly. *It does not attempt to tell what will be the actual result in any one game—this is pure chance—but it tells us what will be the average to which the results of larger and larger numbers of games must continually tend.* In other words, if B had an inexhaustible purse, he might safely pay any amount to A before each game, and be sure of winning in the long run, after an indefinitely great number of games were played. But this, though theoretically exact, is not applicable to mundane gambling—where limited purses and limited time circumscribe the field requisite for the proper development of the mathematical result.

Before quitting this part of the subject, we may give a couple of instances in which the mathematical theory may be easily tested by any one who has a little leisure. One of these we will develop at length, as a final instance of the simple calculations generally involved:

“To find the chance of throwing any given possible number with two dice.”

As the faces of the dice are numbered from 1 to 6, the smallest throw is 2, and the greatest 12.

In one throw the chances are—

$$\text{For } 2 = 1 + 1; \frac{1}{6} \cdot \frac{1}{6} = \frac{1}{36};$$

the probabilities being multiplied (E) because the events are independent. For

$$3 = 1 + 2, \text{ or } 2 + 1; \frac{2}{36};$$

$$4 = 1 + 3, 2 + 2, \text{ or } 3 + 1; \frac{3}{36};$$

$$5 = 1 + 4, 2 + 3, 3 + 2, \text{ or } 4 + 1; \frac{4}{36};$$

$$6 = 1 + 5, 2 + 4, 3 + 3, 4 + 2, \text{ or } 5 + 1; \frac{5}{36};$$

$$7 = 1 + 6, 2 + 5, 3 + 4, 4 + 3, 5 + 2, \text{ or } 6 + 1; \frac{6}{36};$$

Then, in the inverse order—

$$8 = 2 + 6, 3 + 5, 4 + 4, 5 + 3, \text{ or } 6 + 2; \frac{5}{36};$$

and so on—the fact being that if we read the *lower* sides of the dice when the throw is 8, they will give 6, and so on—the sum being always 14.

The mathematical expectation for any one throw is therefore

$$\frac{1}{36} \cdot 2 + \frac{2}{36} \cdot 3 + \frac{3}{36} \cdot 4 + \frac{4}{36} \cdot 5 + \frac{5}{36} \cdot 6 + \frac{6}{36} \cdot 7 + \frac{5}{36} \cdot 8 + \frac{4}{36} \cdot 9 + \frac{3}{36} \cdot 10 + \frac{2}{36} \cdot 11 + \frac{1}{36} \cdot 12.$$

In all—

$$\frac{1}{36}(2 + 6 + 12 + 20 + 30 + 42 + 40 + 36 + 30 + 22 + 12); \text{ or } \frac{1}{36} \cdot 252 = 7.$$

The meaning of this is, *not* that we shall probably throw seven the first time, nor second, nor perhaps for many throws; but that if we throw a number of times, add the results, and divide by the number of throws, the final result will be more and more nearly equal to seven, the greater be the whole number of throws. It is very instructive to make the experiment, say on 100 throws of two dice, as in backgammon. If the mathematical result be not closely verified by such a trial, *the dice are loaded*; or, at least, are ill-made.

Another illustration, and a very excellent one, is furnished by the following theorem:

If the floor be ruled with equidistant parallel lines, and a straight rod, whose length is equal to the distance between any two contiguous lines, be dropped upon it at random, the chance of its falling on one of the lines is $\frac{2}{\pi}$, where π is the ratio of the circumference of a circle to its diameter (see QUADRATURE OF THE CIRCLE). The deduction of this result from the theory of probabilities requires the use of the integral calculus, and cannot be given here; but we may put the above theorem to the test of practice in the following way: Let the rod be tossed a number of times, then the greater this number, the more nearly shall we have

$$\frac{\text{Twice number of throws}}{\text{Number of times the rod falls on a line}} = \pi = 3.14159, \text{ etc.};$$

and therefore, by simply continuing this process long enough, we may obtain as accurate a value as we choose of the ratio of the circumference to the diameter of a circle.

To show how the theory of probabilities would tend, if generally known, to the discouragement of gambling, would require a treatise—as every species of game would have to be treated—we shall therefore only take one case, about as bad a one as can be. This is when a man makes a “book” on a horse-race, so as to “stand to win,” whatever be the result of the race. This is, of course, immoral; for, as it can make no matter who accepts his bets, suppose them all taken by one individual. The latter must therefore have been “done” into a complex transaction by which he is *certain to lose*. The method of making such a “book” is simple enough; it consists mainly in betting *against* each horse. Thus, if three horses, A, B, C, are to start, and he can get the following bets taken,

£4 : £3 against A,
 £5 : £4 “ B,
 £6 : £5 “ C;

his book stands thus:

If A win, he wins £4 + £5 - £4 or £5.
 If B “ “ £5 + £3 - £5 or £3.
 If C “ “ £4 + £3 - £6 or £1.

Now, to examine this case, suppose the *correct* odds to have been laid against A and B, what ought in fairness to be the odds as regards C?

Chance of A winning is $\frac{3}{7}$
 “ B “ $\frac{4}{9}$
 Chance of A or B winning = $\frac{3}{7} + \frac{4}{9} = \frac{55}{63}$.

Hence, chance of C winning = $\frac{8}{63}$; and therefore the legitimate odds against C are 55 to 8, whereas our betting-man has got a *fool* to accept 6 to 5.

The true cause of the detestation which attaches to gambling is not so much the ruin, insanity, suicide, etc., in which it not unfrequently ends, as the fact, that a gambler's work in no case increases the wealth or comfort of the state; all it can effect is a more or less rapid and dishonest transfer of these from one state of distribution to another. It is as useless, so far as regards production, as the prison-crank.

There is a common prejudice as to “*runs of luck*,” which are popularly supposed *not* to be compatible with the mathematical theory. This, also, is a complete delusion. To take a very simple case, the reader will easily see that, if he writes down all the possible cases which may occur in six tosses of a coin, the odds are 19 : 13 in favor of a run of three at least.

To give an instance of the principle of interpretation which we have several times above applied to the mathematical result—viz., that the greater the number of trials, the more nearly will the average result of these trials coincide with it—let us recur to heads and tails. Suppose a coin tossed 10 times, and let H^n stand for H n times, then we have

$$1 = \left(\frac{1}{2} + \frac{1}{2}\right)^{10} = \frac{1}{2^{10}} \left(1 + 10 + \frac{10 \cdot 9}{1 \cdot 2} + \frac{10 \cdot 9 \cdot 8}{1 \cdot 2 \cdot 3} + \text{etc.}\right)$$

of which the terms are [as in (D)] the probabilities of H^{10} , H^9T , H^8T^2 , etc., respectively; the order not being taken account of. The largest term is the 6th, and its value is $\frac{252}{2^{10}} = \frac{252}{1024}$, or about $\frac{1}{4}$. This is the chance of H^6T^4 , without regard to order in ten throws. Although the most probable result, inasmuch as the chances of H^6T^4 and H^4T^6 are each about $\frac{1}{5}$ only, and those of the other possible combinations much smaller—yet it has not a very large chance. But the chance of a result *not deviating much from the most probable one*, is very much larger: in the above case, the chance of having not less than 3H, and not less than 3T, is as much as $\frac{912}{1024}$. But this tendency of the bulk of the results to coincide very closely with the most probable one, is much more evident as we take a greater and greater number of trials. Thus, in 100 trials with the coin, we have

$$1 = \left(\frac{1}{2} + \frac{1}{2}\right)^{100} = \frac{1}{2^{100}} \left(1 + 100 + \dots + \frac{100 \cdot 99 \cdot 98 \dots 51}{1 \cdot 2 \cdot 3 \dots 50} + \text{etc.}\right)$$

[Now we begin to see how the higher analysis comes in. Who is to work out by common arithmetic the value of the fraction $\frac{100 \cdot 99 \cdot 98 \dots 51}{1 \cdot 2 \cdot 3 \dots 50}$? Some calculating boy *might*, with no very enormous labor—but, wait a moment, we may wish to have the result of a million of trials, and what calculator (arithmetical) will tell us the value of

$$\frac{1,000,000 \times 999,999 \times \dots \times 500,001}{1 \times 2 \times \dots \times 500,000}?$$

In this case, the most probable result is $H^{50}T^{50}$, without regard to order, but its chance is only about $\frac{2}{25}$. [The exact value is $\frac{1}{2^{100}} \frac{100.99.98. \dots .51}{1.2.3. \dots .50}$]. Had there been 1000

throws, the chance of $H^{500}T^{500}$ (the most likely combination) would have been about $\frac{1}{38}$.

But, as the number of throws increases, the number of terms grouped close to the largest in the expansion, and whose sum far exceeds that of all the rest, becomes a smaller and smaller fraction of the entire number of terms. Hence the chance that in 1000 tosses there should not be more than 600 nor less than 400 H, is much greater than that of not more than 60 nor less than 40 H in 100 throws; and so on.

Thus it is that all our statistical results, say the ratios of the numbers of births, marriages, suicides, etc., to the whole population—or that of the male to the female births—or that of the dead letters to the whole number posted, etc.—though perhaps never the same in any two years, yet fluctuate between very narrow limits. And thus it is that the theory of probabilities has been the means of solidly establishing, beyond almost the possibility of failure, when properly applied, the inestimable securities afforded by life-assurance.

Another very important application of the theory is to the deduction of the most probable value from a number of observations (astronomical, meteorological, etc.), each of which is liable to error. We may confidently assert that, but for this, astronomy could not have taken the gigantic strides by which it has advanced during the present century. But the "method of least squares," as it is called, which is furnished for this purpose by the theory of probabilities, is far beyond the scope of elementary mathematics, and can therefore only be referred to here. Its fundamental features may be seen in the above process of determining the probability that the result of a number of trials shall lie within certain limits on each side of the most probable result.

The theory of probabilities has been applied to many other important questions, of which we may mention only two—the value of evidence, and the probability of the correctness of the verdict given by various majorities in a jury. But for these, and for the further development of what we have given above from the simplest points of view, we must refer to the various treatises on the subject. Of these, the most accessible to an English reader are the very valuable works of Galloway and De Morgan. Poisson, Gauss, and especially Laplace, have also treated the subject in the most profound manner. But the difficulty of understanding Laplace's great work is such that few have ever mastered it completely; and it is therefore particularly satisfactory that the late prof. Boole in his *Laws of Thought*, has shown how to dispense with a great part of the analysis which renders Laplace's work so formidable.

PROBATE COURT is a court created in England in 1858, in lieu of the old prerogative courts, to exercise the exclusive jurisdiction in all matters touching the succession to personal estate. Since the judicature acts of 1873-75 the probate court is included in the probate, divorce, and admiralty division of the new high court of justice. If a man at his death leaves a will, then it must be produced and verified, so to prove that it is an authentic will, duly executed and signed in presence of witnesses, and therefore that the right to the personal estate is vested in the executors named by the will. The will is sworn to by the witnesses, on being produced; and if the evidence is satisfactory, it is registered, and the original deposited in the court, when copies are made. This process is called proving the will, and the act of court is called the probate of the will. If there is no will, then the rule being, that the personal estate devolves on the next of kin and widow, if any, it is necessary that an application be made to the court to appoint one of the next of kin to be the administrator, and take charge of the payment of debts. This is called taking out administration, and the act of the court appointing the administrators is called letters of administration. Numerous difficulties often arise as to irregularities in the making of wills and as to the party entitled to administration, and it is the function of the court of probate to dispose of these.

PROBATE COURT (*ante*) is called in some states orphans' court, in others surrogate court; and in many of the southern states the probate functions are exercised by a county officer called the ordinary, the name of that officer being taken from the English ecclesiastical law. The powers of probate courts differ greatly in the several states; in all the rule exists that a will cannot pass real or personal estate until it has been proved in due form by the court of probate. The English law that a probate of a will is not admissible as evidence in common-law courts has been modified or abrogated in many states. From the probate an appeal lies to a higher court; and if this be neglected, it is not competent for a party to go into a court of common law with questions as to the sanity or capacity of the testator, or of the proper execution of the testament. Many probate courts, however, are without any authority as to the construction or effect of a will, their jurisdiction extending to the probate proper only. There are two methods of probate, that "in common form" where the proceedings are *ex parte* and without notice to the next of kin or legatees; and proof in "solemn form," where notice is given to all

parties interested, and they are given an opportunity to be heard. In the former case any party interested in the premises has the right to call upon the executor to make proof in "solemn form" any time within 30 years after the first probate. The probate in solemn form is the usual method in this country, and in some states is required by statute. When once approved after a hearing of this kind the will is binding. The party presenting the will is called the proponent, and a disputing party the contestant. The question before the court is whether the document presented is or is not a will. In the United States citation or notice is generally issued by the court to all interested. The most important testimony is that of the attesting witnesses. If, on account of death, absence, or incompetency, a witness cannot be produced, the will may be proved by the other witnesses and testimony of the handwriting of the absent. If all are dead or absent, the handwriting of all must be proved. The capacity of the testator cannot be impeached by an attesting witness without suspicion. The presumption is that if the attestation clause be properly drawn, the requirements as to the subscribing witnesses have been fulfilled, though, as is often the case, they may have forgotten what was said or done on the occasion. A will is said to prove itself 30 years after the death of the testator; nothing is then necessary but its production and presentation to the court. It must, however, be clear from all suspicion of forgery, and come from a trustworthy source. The contents of a will which has been lost, stolen, or destroyed may be proved in the probate court, but the evidence must be very clear and strong.

PROBOSCIDEA, a section of *pachydermata*, of which the characters are given under that head, contains one recent and one fossil genus, *elephas* (see ELEPHANT) and *mastodon* (q.v.); so that the proboscidea seem not to have been numerous at any period of the world's history. Notwithstanding the great size of these creatures, comparative anatomists have pointed out various resemblances in their dentition, osteology, etc., to rodents.

PROBOSCIS MONKEY. See **NASALUS**.

PROBUS, MARCUS AURELIUS, Emperor of Rome, was b. at Sirmium, in Pannonia. His father, Maximus, served first as a centurion, and afterward as a tribune in the Roman army, and died in Egypt, leaving to his only son a good name and a moderate income. Probus early entered the army, and had the good fortune to attract the favorable notice of the emperor Valerian, who elevated him before the legal period to the rank of tribune. His subsequent conduct justified his rapid promotion, for he greatly distinguished himself against the Sarmatians on the Danube, and subsequently in Africa, Egypt, Asia, Germany, and Gaul, winning golden opinions from Valerian's successors, Gallienus, Claudius II., Aurelian, and Tacitus. By the last-named emperor, he was appointed governor of the whole Asiatic possessions of Rome, and declared to be the chief mainstay of the Roman power; and such was the zealous attachment evinced for him by his soldiers, whose respect and love he had equally won by his firm discipline, by his care in providing for their wants and comforts, and his liberality in the distribution of plunder, that, on the death of Tacitus, they forced him to assume the purple; and his rival, Florianus, having been removed, Probus was enthusiastically hailed emperor by all classes (276 A.D.). His brief reign was signalized by brilliant and important successes; the Germans, who, since Aurelian's time, had made Gaul almost a part of Germany, were driven out with enormous slaughter, pursued into the heart of their own country, compelled to restore their plunder, and to furnish a contingent to the Roman armies. Pursuing his victorious career, Probus swept the inimical barbarians from the Rhaetian, Pannonian, and Thracian frontiers, and forced Persia to agree to a humiliating peace. Various aspirants to the imperial purple were also put down. On his return to Rome Probus celebrated these fortunate achievements by a triumph, and then, the external security of the empire being established, devoted himself to the development of its internal resources. The senate was confirmed in its privileges; liberal encouragement was given to agriculture; numerous colonies of barbarians were established in thinly-peopled spots, that they might adopt a civilized mode of life; and all branches of industry were protected and promoted. But Probus was at a loss what to do with his army, as the Romans had now no enemies either at home or abroad; and fearing that their discipline would be deteriorated by a life of inactivity, he employed the soldiers as laborers in executing various extensive and important works of public utility. Such occupations, considered as degrading by the soldiers, excited among them the utmost irritation and discontent; and a large body of troops, who were engaged in draining the swamps about Sirmium, giving way to these feelings, under the excitement produced by the presence of the emperor, murdered him, 282 A.D. Probus possessed great military genius, combined with equal administrative talent, and added to these a wisdom, justice, and amiability equal to that of Trajan or the Antonines.

PROCEDURE, in law, a term used by legal writers to indicate the formal proceedings in a suit and the rules governing them. The English courts of law, from the first, enforced rights by various actions. "Real actions" were used for the recovery of lands; but in later times were mostly abandoned, and "ejectment" became the usual method of trying title to land. The other legal actions were "covenant," to recover damages for breach of an agreement under seal; "assumpsit," to recover damages for breach of a con-

tract not under seal, whether written or parole; "trover," to recover damages for the conversion of chattels; "detinue" and "replevin," to recover possession of chattels; "debt," to recover a liquidated sum from the defendant; "trespass," to recover damages for a wrongful act of violence to property or person; and "case," to recover damages where such act was without violence, or the injury complained of was indirect. The rules of these actions were exceedingly technical, as were the rules of pleading used in conducting them; and though the rights of a party might be perfectly clear, he would lose the suit if he had failed to bring the technical form of action suitable to their enforcement, or violated the particular form of plea. At equity, there were no specified forms of action; but one simple form of procedure enabled parties to establish their claims or defenses, and, if necessary, afforded the relief asked for. The complainant's case was set forth in detail in the "bill," to which defendant replied, stating his side of the case, in the "answer," and the court so framed its decree as to afford relief to the proper parties, whether complainants or defendants, and equitably to arrange the rights of all parties interested. To secure this equitable adjustment, every person whose interests would be affected by the chancellor's decree was made party to the suit. The principles of procedure at common law and at equity were adopted in this country, where they were for a long time substantially identical with the English forms of procedure from which they were taken. The old common-law pleading, and the distinction between courts of equity and law are still retained in some states. But since 1848, when the legislature of New York authorized a civil code, chiefly the work of David Dudley Field, many other states have given up the old methods, abolished the distinction between law and equity, and substituted a single "civil action" for the enforcement of all rights. All proper defenses, whether legal or equitable, are available and may be combined in this action, and similarly, all claims of whatever nature may be enforced. The final judgment of the court, like a decree in chancery, from the consideration of all the claims and defenses, determines the rights of all the parties to the suit. The technical forms of pleading have also been abolished in New York and other states which have adopted a code modeled after that of New York. The parties to the suit, in setting up their claims or defenses, are only required to make a statement of their claims or defenses in ordinary words. This system, with inconsiderable modification of detail, now prevails in 23 states and territories. It is a "civil" code only, and in criminal cases the old exactness of pleading is still required.

PROCELLARIDÆ, a division of Cuvier's section of *longipennes* (q.v.), comprising the petrels, members of which are Mother Carey's chickens. See **PETREL**, and **MOTHER CAREY'S CHICKENS**, *ante*.

PROCESS is the system of action by which a court calls parties into court for purposes of litigation. There are numerous rules governing the steps of process, but these are all of a technical nature.

PROCESS (*ante*), in law, the means of enforcing the appearance in court of a defendant and his obedience to the writ of the court. In civil cases, it was the practice to issue a summons to the defendant, which, in real actions, was served by the erection of a white wand on the inclosure of the defendant, and in personal actions was served by two summoners. If the defendant paid no attention to this summons, his goods were attached. In trespasses the attachment was issued immediately without a summons. On failure of the attachment, a *distringas* issued and was not discontinued till the appearance of the defendant. In case of injuries committed with force to the person, arrest was authorized. In England till the reign of William IV., an action was begun by original writ in the king's name, addressed to the sheriff, ordering him to summon the defendant. Since then personal actions are begun, if the defendant is to be arrested, by a writ of *capias*, which is an order of the court commanding the sheriff to take the defendant and hold him to bail, or, in default of bail, to keep him in custody. If the defendant is not to be arrested, a summons issues ordering him to appear and answer the plaintiff's claim. The similar process in the admiralty and ecclesiastical courts is called a citation, and, in chancery, a subpoena. The methods of procedure in the states of the union which retain the common-law procedure are different, but generally conform to the writ of summons. In those states where a new code of procedure has been adopted, suits in the superior court begin by a summons or notice to the defendant ordering him to appear in court within a certain time. This notice or summons is issued by the clerk of the court, or by the plaintiff or his attorney, in some states. In New England, it is the practice to begin a suit by attachment of the defendant's property. Final process, or process of execution is enforced either against the person or the property of the defendant. The former can be resorted to only where the defendant may be arrested. The latter, called the execution, or *feri-facias*, commands the sheriff to satisfy the execution out of the defendant's property. The other writ of execution, called the *capias satisfaciendum*, commands the sheriff to seize the defendant's body in default of property.

PROCESSIONAL (Lat. *processionale*), the service-book which contains the prayers, hymns, and general ceremonial of the different processions. Many ancient books of this class have been preserved. The processional approved for common use is that of Rome, of which many editions have been published.

PROCESSION OF THE HOLY GHOST, that doctrine regarding the third person of the blessed Trinity which teaches that as the Son proceeds (or is born) from the Father, so the Holy Ghost proceeds (or emanates) from the Father and from the Son, but as from one principle. The question of the origin of the Holy Ghost was not distinctly raised in the early controversies, which fell chiefly upon the second person. In the creed of Nice, no allusion whatever is made to the subject; and in the creed of Constantinople, the Holy Ghost is said simply to "proceed from the Father." Nevertheless this was understood in the Latin church to mean that, as the Son proceeds from the Father, the Holy Ghost proceeds from both Father and Son; and in the course of the 7th and 8th centuries, the words "and from the Son," for greater distinctness came to be added to the creed in the several churches—as the west. In the controversy with the Latins, Photius (q. v.) took exception to this addition, as unauthorized, and made the addition one of the grounds for his charge of heresy against them, which was resumed on the consummation of the schism under Michael Cerularius. In the union of the Greek and Latin churches at Florence (1437), an article of agreement on this head was adopted, and the words *Filioque* were sung twice over both in Latin and Greek, in the solemn mass which celebrated the union. But this union had no root in the popular mind, and the dispute still continues as of old to divide the churches.

PROCESSIONS, as solemn and religious rites, are of very great antiquity. With the Greeks and Romans, they took place chiefly on the festivals of Diana, Bacchus, Ceres, and other deities; also before the beginning of the games in the circus; and in spring when the fields were sprinkled with holy water to increase their fertility. The priests used to head them, carrying images of the gods and goddesses to be propitiated, and either started from certain temples or from the capitol. Among the Jews, certain processions around the altar were (and still are to a certain extent) usual on the feast of tabernacles; and from them the Mohammedans have adopted their mode of encompassing the sanctuary seven times at Mecca (q. v.). Processions form a prominent part of the Buddhist worship. The practice was early adopted in the Christian church. The reformation abolished it; and even in the Roman Catholic church, especially in mixed countries, processions are less frequent or popular now than in former years. They are there either supplicatory processions, and are either directed to a certain distant place, to some miraculous image or object, or they are confined to the streets of the cities and the churches. Banners, crosses, and images are generally carried in front; the clergy follow; and the people make up the rear, singing hymns or reciting prayers. In some Protestant states, they are still permitted under certain restrictions. There is no doubt that, whatever their general intrinsic value, they offer in many instances one of the most strikingly picturesque features of the Roman faith, and that they answer a certain instinctive want in the multitude. For extensive pilgrimages, as such, their history and rites, we refer to PILGRIM, MECCA, FESTIVALS, etc.

PROCHEIN AMI, the old Norman-French for next friend, still often used in English law, means the next person in whose name an infant sues in a court of law, or a married woman in a court of equity. The chief object is to have a person responsible for costs. See NEXT FRIEND.

PRO'CIDIA, an islet of Italy, between the island of Ischia and the shores of Naples, and separated from both of these by sea-ways about a m. in width, is 3 m. long and 1 m. broad. Pop. 13,810. On its shores is the city of the same name, with a commodious harbor, a fine regal palace, and a horrible state prison, recently rendered famous by Carlo Poerio, who was confined there in chains.

PROCLAMATION, a public notice given by the sovereign to his subjects. The power of issuing proclamations is part of the prerogative of royalty as the fountain of justice. They sometimes consist of an authoritative announcement of some matter of state, or act of the executive government affecting the duties and obligations of subjects. The demise of the crown, and accession of a new sovereign, a declaration of war, and the issue of new coin, are all occasions on which a royal proclamation is issued. A proclamation may also be issued to declare the intention of the crown to exercise some prerogative or enforce some law which has for a long time been dormant or suspended. In time of war, the crown by a proclamation may lay an embargo on shipping, and order the ports to be shut. But the most usual class of proclamations are admonitory notices for the prevention of offenses, consisting of formal declarations of existing laws and penalties, and of the intention to enforce them; such as the proclamation against vice and immorality, appointed to be read at the opening of all courts of quarter sessions in England.

Proclamations are only binding when they do not contradict existing laws, or tend to establish new ones, but only enforce the execution of those which are already in being, in such manner as the sovereign judges necessary. A proclamation must be under the great seal. Statute 31 Henry VIII. c. 8 declared that the king's proclamations should be as binding as acts of parliament; an enactment which, while it subsisted, made an entire revolution in the government; but was repealed by 1 Edw. VI. c. 12. In later times, it was attempted to be maintained by the crown lawyers that the king might suspend or dispense with an existing law by proclamation; a power, however, which act 1 Will. and Mary c. 2 declared not to exist.

PROCLUS, called the **SUCCESSOR** (*Diadochos*)—i.e., of Syrianus, as the head of the Athenian school—a celebrated Neoplatonist, was b. in Constantinople in 412. He was of Lycian origin, and received his first instruction at Xanthus, in Lycia. He then studied at Alexandria under Arion Leonaras, Hero, and especially under Heliodorus, with whom he applied himself chiefly to Aristotelian and Platonic philosophy. From thence he went to Athens, where a certain Plutarch, a philosopher, and his daughter, Asclepiogenicia, became the instructors—the latter a priestess of Eleusis, chiefly in theurgic mysteries. The vivid imagination and enthusiastic temperament which in his childhood already had led him to believe in apparitions of Minerva and Apollo, naturally convinced him when all the influences of the mysteries (q. v.) were brought to bear upon him, still more of his immediate and direct intercommunication with the gods; and distinctly believed himself to be one of the few chosen links of the Hermaic chain through which divine revelation reaches mankind. His soul had, he thought, once lived in Nicomachus the Pythagorean, and, like him, he had the power to command the elements to a certain extent, to produce rain, to temper the sun's heat, etc. The Orphic poems (q. v.), the writings of Hermes, and all that strangely mystical literature with which the age abounded, were to him the only source of true philosophy, and he considered them all more or less in the light of divine revelations. That same cosmopolitan spirit in religious matters which pervaded Rome toward her end, had spread throughout all the civilized "pagan" world of these days, and Proclus distinctly laid it down as an axiom, that a true philosopher must also be a hierophant of the whole world. Acquainted with all the creeds and rites of the ancient Pantheons of the different nations, he not only philosophized upon them in an allegorizing and symbolizing spirit, as many of his contemporaries did, but practiced all the ceremonies, however hard and painful. More especially was the practice of fasting in honor of Egyptian deities, while, on the one hand, it fitted him more and more for his hallucinations and dreams of divine intercourse, on the other hand more than once endangered his life. Of an impulsive piety, and eager to win disciples from Christianity itself, he made himself obnoxious to the Christian authorities at Athens, who, in accordance with the spirit of religious intolerance and fanaticism which then began to animate the new and successful religion against which Proclus waged constant war, banished him from this city. Allowed to return, he acted with somewhat more prudence and circumspection, and only allowed his most approved disciples to take part in the nightly assemblies in which he propounded his doctrines. He died in 485, in his full vigor, and in the entire possession of all his mental powers, for which he was no less remarkable than for his personal beauty and strength.

Respecting his system, some modern philosophers have exalted it to an extent which his own works would hardly seem to warrant. Victor Cousin holds that he has concentrated in it all the philosophical rays which emanated from the heads of the greatest thinkers of Greece, such as Pythagoras, Plato, Aristotle, etc. Proclus recognizes a certain kind of unity of the Creator, or rather of the divine mind, of which he took the human to be a fragment; and he speaks of the "One" and the "First." The human soul he considered wrapped up in various more or less dense veils, according to the degree of perfection attained; and he further assumed a certain sort of solidarity between the souls of those who naturally, or by certain immutable circumstances, were linked together, such as children and parents, rulers and subjects; and he carried this doctrine so far as to assert, that the children must naturally participate in their parents' faults. Faith alone, he further held, was essential to the attainment of theurgy, which, comprising mantic and supernatural inspiration, is preferable to all human wisdom; and in this he chiefly differs from Plotinus (q. v.), with whose system he agrees in most other respects. He further tries to recognize and to fathom the original mysterious one by combination of figures, strongly reminding us of Gnosticism and the latter Kabbala. His way of developing the finite beings out of the infinite unit is also peculiar. A whole series of triads, at the head of each of which again stands a unit, goes in various gradations through the creation, the lower powers emanating from the higher, which are the thinking and creative ideas, etc. See **PLOTINUS**, **GNOSTICS**.

Of his manifold works, there have survived several hymns which by the true poetical and religious spirit which pervades them, stand out most favorably among the generally inane Orphic hymns. Of his astronomical and mathematical writings, there have survived a short summary of the chief theories of Hipparchus, Aristarchus, Claudius Ptolemaeus, and others, a work *On the Heavenly Spheres*, a commentary on Euclid, and a work—only known in a Latin translation—*On the Effects of the Eclipses of the Sun and Moon*. His grammatical works consist of some commentaries on Homer, Hesiod, etc. The greater part of his writings is devoted to philosophy. These are partly commentaries and paraphrases of Platonic dialogues, and partly the embodiments of his own ideas in a systematic form. We thus have a work—again preserved in Latin only—*On Providence and Fate*, *On the Ten Doubts about Providence* etc., *On Platonic Theology*, and other minor works, extant in a more or less fragmentary form, and repeatedly edited, with translations and modern commentaries. The most important of his works, however, is the *Philosophical and Theological Institution*, in which Proclus geometrically, as it were, evolves his doctrines by heading each of its 211 chapters by a kind of proposition, which he proceeds to demonstrate, appending corollaries in some instances. He chiefly treats in it of unity and multiplicity, on productive causes and effects, on the

highest good, on that which suffices in itself, on immobility, perfection, eternity, divinity, and intelligence; on the soul, etc. Next in importance stand his commentaries on Plato's *Timæus*, which, however, now only embraces a third of this dialogue, a similar commentary on Plato's *Parmenides*, in seven books, on *Cratylus*, the *First Alcibiades*, and fragments on other Platonic writings. Some other works attributed to Proclus have by modern investigators been pronounced to be spurious.

PROCONSUL, a Roman magistrate not holding the consulship, who was invested with powers nearly approaching those of a consul, not, however, extending over the city and its vicinity. The proconsul was, at first, one who had held the office of consul, whose *imperium* was prolonged to enable him to bring an unfinished campaign to a close. The duration of the office was a year. During the latter period of the republic, when the consuls were expected to spend the year of their consulate at Rome, they were generally appointed at its close to undertake, as proconsuls either the conduct of a war in some province, or its peaceful administration. Occasionally, the office of proconsul, with the government of a province, was conferred on a person who had never held the consulship. Under Constantine, parts of certain dioceses came to be governed by proconsuls.

PROCOPE, ANDREW, the Hussite leader, known as Procop the elder, or the holy, or the shaven, in allusion to his having received the tonsure in early life, was born toward the close of the 14th c., and belonged to a noble family of Prague. After having traveled with an uncle for some years through France and Spain, he returned to Bohemia at the outbreak of the religious wars, in which Ziska (q.v.), took so prominent a part, and at once entered the ranks of the insurgent Hussites. His military genius soon raised him to the rank of an influential commander; and on the death of Ziska in 1424, Procop was elected by the Taborites, who formed an important section of the Hussites, as their leader, and from this period till 1427 his history presents an almost unbroken series of daring attacks upon the Austrians. In the meantime, another body of Taborites, who called themselves orphans, had overrun Lausitz, and burned Lauban, under the leadership of a man, subsequently known as Procop the lesser, or younger, who now, in concert with the more distinguished Procop, attacked Silesia, and took part in those internal feuds of the Hussite factions by which Bohemia was almost wholly ruined. The threatened approach of three German armies, which had been levied by the neighboring states to carry on an exterminating crusade against the heretics, was alone able to restore unanimity to the divided Hussites, who, under the leadership of the two Procops, offered a desperate and successful resistance to the larger numbers of the Germans, subsequently pursuing their enemies with fire and sword through Silesia, Moravia, and Hungary, as far as Presburg. In 1429 Procop made inroads into the German states as far as Magdeburg, and returned to Bohemia laden with spoil, and followed by a numerous band of captive nobles and knights; and in the following year, at the head of 50,000 men-at-arms, and half as many horsemen, he again broke into Misnia, Franconia, and Bavaria, and after having burned 100 castles and towns, and destroyed 1400 villages and hamlets, and carried off a vast amount of treasure, turned his arms against Moravia and Silesia. The emperor Sigismund at this crisis offered to treat with him, but the imperial demand that the Hussites should submit to the decision of a council, afforded Procop a pretext for breaking off all negotiations with the imperial court. A second German crusading army now advanced in 1431, but was thoroughly defeated at Riesenburg. These successes, which were followed by others of nearly equal importance in Silesia, Hungary, and Saxony, where the princes had to purchase peace at the hands of the two Procops, on humiliating terms, induced the council of Basel to propose a meeting between the Hussite leaders and ten learned Catholic doctors. The meeting lasted 50 days, but was productive of no good result, and Procop returned to Bohemia, where, combining his forces with those of Procop the lesser, he laid siege to Pilsen. The council, on this, passed an act, known as the Basel compact, by which the Hussites were allowed the use of the cup in the Lord's-supper, and the Bohemians were designated by the title of the "first sons of the Catholic church." The Taborites and orphans, under the leadership of the two Procops, refused, however, to have anything to do with the pope, and hence dissensions arose between them and the more moderate of the Hussites. After many lesser encounters between these factions, a decisive battle was fought near Lipau in 1434, in which Procop was induced, by a feint of the enemy, to leave his intrenchments. His followers at first fought desperately against the troops of the Bohemian nobles, who were commanded by Meinhard of Neuhaus; but at length, under the influence of a sudden panic, they gave way, and took to flight. Procop, after vainly striving to re-form their broken lines, threw himself into the midst of the enemy, and was killed. Procop the lesser, following in his steps, was also slain, and with these two brave Hussite leaders the cause of the Taborites perished.

PROCOPE PIUS, an eminent Byzantine historian, was born at Cæsarea, in Palestine, about the beginning of the 6th c., went to Constantinople when still a young man, and acquired there so high a reputation as a prof. of rhetoric, that Belisarius, in 527, appointed him his private secretary. Procopius accompanied the great warrior in all his important campaigns in Asia, Africa, and Italy, and appears to have displayed remarkable practical as well as literary talent, for we find him placed at the head both of the commissariat

department and of the Byzantine navy. He returned to Constantinople shortly before 542, was highly honored by Justinian, and appointed prefect of the metropolis in 562. His death occurred, it is thought, about three years later. Procopius's principal works are his *Historia*, in 8 books (two on the Persian war, from 408 to 553; two on the war with the Vandals, from 395 to 545; four on the Gothic war, going down to 553); *Ktis-mata*, or six books on the buildings executed or restored by Justinian; and *Anekdotai*, or *Historia Arcana* (of doubtful genuineness), a sort of *chronique scandaleuse* of the court of Justinian, in which the emperor, his wife Theodora, Belisarius, his wife Antonina, and other distinguished persons, are depicted in the darkest colors. The most valuable of these productions is undoubtedly the first, in which Procopius writes with the clearness, weight, and fullness of knowledge that might be expected of a man who had been an eye-witness of much of what he narrates, and who had occupied a position that fitted him to thoroughly understand what he had seen. He is the principal authority for the reign of Justinian. His style is pure, vigorous, and flexible. The best edition of his complete works is that by Dindorf (3 vols. Bonn, 1833 38).

PROCRUSTES (Gr. "the stretcher,") the surname of a celebrated robber of Attica, named Damastes, or Polypemon. According to the ancient legend, he was wont to place all persons who fell into his hands upon a bed which was made either too long or too short for them, and where he racked their limbs till they died. This he continued to do until Theseus overpowered him, and made him suffer the tortures he had inflicted on others. The story has given rise to a figurative expression. When an author is subjected by a critic to a cruel or unfair mode of criticism, he is said to be stretched on "the bed of Procrustes."

PROCTER, BRYAN WALLER, an English poet, better known as **BARRY CORNWALL**, was born Nov. 21, 1787, and educated at Harrow. He studied law, was called to the bar in 1831, and for many years was one of the commissioners of lunacy, but resigned in 1860. His *Dramatic Scenes and other Poems* were published in 1819, and he subsequently produced several volumes, both of verse and prose, the most important being *Mirandola, a Tragedy*, produced with great success at Covent Garden. As a poet, Procter belongs to the school of Keats and Hunt, and through all his works the influence of the old English dramatists may be traced. It is not, however, on his *Dramatic Scenes* or his tragedies, but on his *English Songs and Lyrics*, that Procter's reputation rests. He may fairly be considered the best of our modern English song-writers. He died Oct. 4, 1874. *Bryan Waller Procter, an Autobiographical Fragment, with Biographical Notes*, appeared in 1877.

PROCTER, ADELAIDE ANNE, 1825-64; b. Eng.; the eldest daughter of Bryan Waller. In 1853 she became a contributor of verses to *Fraser's Household Words* under the nom de plume of Mary Berwick, and attracted the attention of Charles Dickens, who did much in the way of introducing her contributions to the public. Afterward she contributed also to the *Cornhill Magazine* and *Good Words*, and in 1858 published her collected poems under the title of *Legends and Lyrics, a Book of Verse*. In 1860 another volume appeared entitled *A Second Volume of Verse*; and in 1865 both series were again published, with an introduction and short memoir by Mr. Dickens.

PROCTOR (formed by contraction from Lat. *procurator*, one who cares for another) is the name given to the practitioners in courts of admiralty, and in the ecclesiastical and prerogative courts. It corresponds to attorney or solicitor in the other courts. By a recent statute, which abolished the exclusive jurisdiction of the admiralty and prerogative courts, now the probate court, all proctors were put on the same footing as attorneys and solicitors, and the power to practice in the new courts indifferently was given to each; and at the same time compensation was given for the loss of their monopoly. The mode by which one becomes a proctor is therefore the same as that by which one becomes an attorney or solicitor (q.v.).

PROCTOR, HENRY, 1765-1822; b. Wales; entered the army in 1781, and became col. in 1810. In the war of 1812 he came to Canada at the head of the 41st regiment. He repulsed gen. Hull from Amherstburg, and defeated him at Brownston. For his victory over Winchester at the river Raisin he was made brig.gen. In 1813 Harrison defeated him at fort Meigs, and Croghan at fort Stephenson. Oct. 5 of the same year he was totally defeated by Harrison at the battle of Thames, and was afterward court-martialed and suspended from his rank and pay for six months. He was soon given his old rank, served again in the war of 1812, and rose to be lieut.gen.

PROCTOR, RICHARD ANTHONY, b. Eng., 1837; educated at King's college, London, and at Cambridge. He edited the *Proceedings* of the Royal astronomical society in 1872-73. He has constructed a chart of 324,000 stars, made researches into the transits of Venus in 1874, and propounded the theory of the inner complex solar atmosphere, discovered by prof. Young. He visited America, and lectured in 1873 74, 1875, and 1881. Among his works are *Saturn and his System*, 1865; *Half Hours with the Telescope*, 1868; *Other Worlds than Ours*, 1870; *Transits of Venus*, 1874; *A Treatise on the Cycloid*, etc., 1878; and *The Romance of Astronomy*, 1880.

PROCTORS, officers in the universities of Oxford and Cambridge (two in number in each), whose duties are to preserve the peace of the university, to repress disorders among the students, and inflict summary academical punishment. They have the command of the academical constabulary force, and have also an extensive police jurisdiction in the town. The proctors must be masters of arts, and are chosen by the colleges according to a certain rotation. They nominate two pro-proctors to be their deputies and assistants. The summary authority of the proctors extends both to under-graduates and bachelors of arts. They have also a legislative authority as assistants to the heads of houses, and vote in the election of some of the professors and other officers.

PROCURATOR-FISCAL, a legal practitioner in Scotland of some consequence, owing to his being the public prosecutor for a local district. He is generally a local procurator, or law-agent, and is appointed by the sheriff of the county, or in cities and towns by the magistrates. His business is to take the initiative in the prosecution of crimes. There being no coroner's inquisition in Scotland, he does the work which that functionary does in England. Whenever he has reason to believe a crime has been committed, his duty is to apply for a warrant to arrest the alleged criminal, or to summon him before the sheriff, when the witnesses are cited, and are precognosed—that is, they give what evidence they are in possession of. All the inquests and examinations of the procurator-fiscal are conducted privately; neither the press nor the public being allowed to be present. This arrangement, as tending to huddle up that which should be fully known—as, for example, the cause of catastrophes attended with loss of life—has latterly been the subject of earnest remonstrance. If the procurator-fiscal is informed of a crime which he thinks was either not committed, or of which there is no evidence satisfactory, he gives his concurrence merely to the private party who suggests it, but does not himself initiate the proceeding. When the procurator-fiscal takes the precognitions of the witnesses, he sends a copy of them to the crown counsel, of whom the lord-advocate is the chief; and if these counsel think the evidence is strong enough, and warrants more than suspicion, the prosecution is proceeded with to trial. The procurators-fiscal are now paid by salaries according to the population of the district.

PROCYONIDÆ See COATI; RACCOON; *ante*.

PRODIGY. See OMEN.

PRODUCTION OF DOCUMENTS is often required in legal proceedings, or in the course of a suit, in Scotland, as well as in other countries; but it depends on the nature of the suit when and under what conditions the documents must be produced. As a general rule, whenever a right is founded on a document, that document must be produced or shown to the court which has to determine the nature of the right.

PRODUCTIVE AND UNPRODUCTIVE LABOR. See LABOR.

PROFERT. See OYER

PROFESSOR, an officer in a university whose duty it is to instruct students, or read lectures on particular branches of learning. In the early times of universities, the degrees conferred on students were licenses to act as public teachers; and the terms master, doctor, and professor were nearly identical in signification. As, however, the body of graduates ceased in the course of time to have any concern in public teaching, a separate class of recognized teachers sprang up, paid sometimes with salaries, in other instances by fees. These were called professors; and in the German and Scottish universities became the governing body, and sole recognized functionaries for the purpose of education. In the universities in which collegiate foundations prevailed, as Oxford and Cambridge, they became, on the other hand, only secondaries or auxiliaries, attendance on their lectures not being generally deemed indispensable, and the necessary business of instruction being carried on by the functionaries of the several colleges.

The word professor is occasionally used in a loose way to denote generally the teacher of any science or branch of learning, without any reference to a university. It has been assumed as a designation not only by instructors in music and dancing, but by conjurers.

PRO FILE, the outline of a section through a cornice or other series of moldings.—The outline of a capital when drawn geometrically; the outline of the human face in a section through the median line, etc

PROGNOSIS, (from the corresponding Greek word) is the term employed in medicine to indicate the opinion or decision of the physician regarding the probable course and issue of a disease. The physician is guided in arriving at his decision by his knowledge of the course which the disease usually follows; and as some diseases almost always end in recovery, and others almost invariably terminate fatally, the final result may often be predicted with great confidence. In forming a prognosis, the physician must, however, not only take into his consideration the natural history of the individual disease, but numerous modifying influences, such as age, sex, mode of life, previous state of health, etc.

PROGRESS OF TITLES, in Scotch law, means the series or chain of conveyances by which a proprietor of lands establishes his right to property. As these titles are the sole evidences of property, the progress of titles—i. e., a short statement of the nature of each

conveyance, in their historical order—is first given to a purchaser, to show that the vendor is able to sell. See SALE OF LAND.

PROGRESSION, in arithmetic, is the succession, according to some fixed law, of one number after another. A series of numbers so succeeding one another is said to be "in progression." Progression may be of various kinds; but the three forms of most frequent occurrence are *arithmetical progression* (q.v.), *geometrical progression* (q.v.), and *harmonical progression*. The conditions of the harmonical progression of a series are frequently stated as follows: *three numbers are in harmonical progression, when the first has to the third the same ratio that the excess of the first over the second has to the excess of the second over the third*, i.e., a, b, c are in harmonical progression when $a:c::a-b:b-c$; but a much simpler conception of it is obtained by means of one of its properties, viz., that if the terms of a harmonical series be inverted, they form a series in arithmetical progression; thus, 1, 2, 3, 4, 5, 6, etc., is an arithmetical progression, and $1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \frac{1}{6}$, etc., is a harmonical progression; $1, \frac{1}{2}, 0, -\frac{1}{2}, -1$, etc., is an arithmetical progression; and 1, 2, ∞ (infinity), $-\infty, -1$, etc., is a harmonical progression. This series is principally important in connection with the theory of music, in determining the length of the strings of instruments. See MUSIC.

PROGRESSION, MUSICAL, the regular succession of chords or movement of the parts of a musical composition in harmony, where the key continues unchanged, is called progression; where a new key is introduced, it is not progression, but modulation (q.v.). Musical compositions move from note to note either by degrees, when the interval does not exceed, or by skips where it does exceed a whole tone. Motion in music of two parts is of three kinds: oblique, when one part repeats or holds on the same note, while the other moves up or down; direct, when both parts move in the same direction; and contrary, when one moves up, and the other down. In progressing from chord to chord, it is in general desirable to retain every note common to both chords in the same part in which it appeared in the first chord, and to assign every new note to that part in the second chord which is nearest to it. There are certain chords which require to be followed by certain others in order to resolve them (see RESOLUTION); and there are certain progressions which must in ordinary cases be avoided, more particularly consecutive fifths and consecutive octaves, the latter being, however, admissible when employed to strengthen a part.

PROHIBITION. Prohibitive duty refers to a practice, obsolete in this country, of prohibiting the importation of goods, with the view of encouraging native industry. See FREE TRADE.

PROHIBITION is a writ in England proceeding out of a superior court of law to prohibit or prevent an inferior court from proceeding to hear or dispose of a suit or matter over which it has no jurisdiction.—In Scotch law, the same word means a technical clause in a deed of entail by which the heir of entail is prohibited from selling the estate, or contracting debt, or altering the order of succession under pain of forfeiture, which forfeiture is declared by another supplemental clause called a resoluteive clause.

PROJECTILES, THEORY OF, is the investigation of the path or *trajectory*, as it is called, of a body which is projected into space in a direction inclined to that of gravitation. A body thus projected is acted upon by two forces, *the force of projection*, which, if acting alone, would carry the body onward forever in the same direction and at the same rate; and *the force of gravity*, which tends to draw the body downward toward the earth. The force of projection acts only at the commencement of the body's motion; the force of gravity, on the contrary, continues to act effectively during the whole time of the body's motion, drawing it further and further from its original direction, and causing it to describe a curved path, which, if the body moved in a vacuum, would be accurately a parabola. This is readily seen by considering Fig. 1, in which A represents the point from which the body is projected (suppose the embrasure of a fort); AB the direction of projection (horizontal in this instance); A1 the distance which would be passed over by the projectile in unit of time if gravity did not act; 1—2, the distance which would similarly be described in second unit of time; 2—3, 3—4, etc., the distances corresponding to the third, fourth, etc., units of time—all these distances being necessarily equal, from the impulsive nature of the force of projection: A1', again, represents the distance which the projectile would fall under the action of gravity alone in the first unit of time; 1'—2' the distance due to gravity in the second unit of time; 2'—3' the distance due to the third unit, etc., the distances A1', A2', A3', etc., being in the proportion of 1, 4, 9, etc. (see FALLING BODIES); hence, by the well-known principle of the *composition of forces and velocities* (q.v.), we find at once, by completing the series of parallelograms, that at the end of the first unit of time the body is at *c*, at the end of the second at *b*, at the end

FIG. 1.

of the third at *e*, etc. Now, as the lines 1'*c*, 2'*b*, 3'*e*, etc., increase as the numbers 1, 2, 3, etc., and the lines A1', A2', A3', etc., as the numbers 1², 2², 3², it follows that the curve *Acbe* is a parabola (q.v.). As, by the second law of motion, each force produces its full effect undisturbed by the other, it follows that the projectile reaches *f* in the same time as it would, without being projected, have taken to fall to 4'. A greater velocity of projection would make it take a wider flight; but at the end of four seconds, it must still be at some point in the same horizontal line—at *g*, for example.

In order to determine exactly the motion of a projectile, and to find its range, greatest altitude, and time of flight, it will be necessary to examine its nature more technically—for which some slight knowledge of algebra and trigonometry is requisite. Let the body in this instance be projected obliquely to the direction of gravity, from the point A (Fig. 2) in the direction AT, and let the velocity of projection *v* be sufficient, if gravity were not to act, to carry it to T in *t* units of time, and let the force of gravity, if allowed to act upon it at rest, carry it to G in the same time; then, as before, the body, under the action of both forces, will be found at P (which is found by completing a parallelogram of which AT and AG are the sides) at the end of *t* units of time, having fallen through a distance equal to TP (not at once, but in a constant succession of minute deflections, as indicated in Fig. 1) in that time. Let *t* represent the time of flight, *v* the velocity due to projection, *g* the accelerating force of gravity, and let *A* be the angle of elevation TAB; then AT = *vt*, TP = $\frac{1}{2}gt^2$, TM = *vt* sin. A; and consequently PM (or *y*) = *vt* sin. A - $\frac{1}{2}gt^2$ (I.), and AM (or *x*) = *vt* cos. A. Now, if we find from the last two equations the values of *t*, and equate these values, we obtain, by an easy algebraic process, the equation *y* = *x* tan.

FIG. 2.

Let $A = \frac{gx^2}{2v^2 \cos.^2 A}$; and if the height through which the body must fall to acquire a velocity equal to the velocity of projection be called *h*, then $v^2 = 2g.h$, $h = \frac{v^2}{2g}$, $4h = \frac{2v^2}{g}$, and $\frac{1}{4h} = \frac{g}{2v^2}$, substituting which in the equation, we obtain $y = x \tan. A - \frac{x^2}{4h \cos.^2 A}$ (II.), as the equation to the path of a projectile, where *x* is the horizontal distance, and *y* the corresponding height above the level of the point of projection. Suppose, now, that we wish to find the *time of flight* on the horizontal plane, it is evident that at the end of its flight the projectile will be at B, and *y* will be equal to zero; hence, putting *y* = 0 in equation I., we obtain $t = \frac{2v \sin. A}{g}$. The *range* or distance AB is similarly found by putting *y* = 0 in equation II., when *x* is found to be equal to $4h \sin. A \cos. A$, or $2h \sin. 2A$. The *greatest altitude* is evidently the point which the projectile has attained at the

end of half the time of flight, or after it has traversed half its horizontal range; hence, by putting $x = 2h \sin. A \cos. A$ in equation II., or $t = \frac{v \sin. A}{g}$ in equation I., we obtain $y = h \sin.^2 A$. A slight examination of the expression for the range will show that it is greatest when the body is projected upward at an angle of 45° to the horizon, and that a body projected at a greater angle than 45° has the same range as one projected at an angle correspondingly less (Fig. 3).

These results, however, do not correspond to the actual circumstances of the case, except when the projectile possesses considerable density and its motion is slow, for in all other cases, the resistance of the air, which increases in a rapid ratio with the velocity

FIG. 3.

FIG. 4.

of the projectile, causes it to deviate very considerably from a parabolic orbit, especially during the latter half of its course (Fig. 4). The problem of the motion of a projectile thus complicated becomes of considerable difficulty; partly because our knowledge of the law of resistance of the air is imperfect (it was supposed by Newton to be proportioned to the square of the velocity), and partly because the law varies with every minute change in the form, size, and density of the body projected, so that, under these circumstances, the beautiful and simple theory sketched above is practically useless. The chief illustrations of the theory of projectiles are the motion of missiles thrown by the hand, or arrows impelled from a bow, in both of which cases the resistance of the air is comparatively ineffective, the velocity being small; in the far more important case of ball-practice, whether with fire-arms or heavy ordnance, its effects are so powerful as to render the laws of gunnery mere deductions from experience. See RIFLE AND RIFLED ORDNANCE, and GUNNERY.

PROJECTION is the representation on any surface of objects or figures as they appear to the eye of an observer. It thus includes perspective (q.v.), and is most simply illustrated by the shadow of an object thrown by a candle on a wall; the shadow being the projection, and the place of the light the position of the eye. The theory of projections is of great importance, both in mathematics and geography, being, in the former case, perfectly general in its application; while in the latter only the projection of the sphere is required. Projections of the sphere are of various kinds, depending upon the position and distance of the eye from the sphere, and the form of the surface on which the projection is thrown; thus we have the *orthographic*, *stereographic*, *globular*, *conical*, and *cylindrical or Mercator's* projections, all of which are treated of under the article MAP. Another projection frequently employed is the *gnomonic*. In the gnomonic projection, the eye is supposed to be situated at the center of the sphere, and the surface on which the projection is thrown is a plane surface which touches the sphere at any one point (called the *principal point*). It is evident that a map constructed on the gnomonic projection is sensibly correct only for a circular area whose circumference is at a small angular distance from the principal point. From the position of the eye in the gnomonic projection, it follows that all great circles, or portions of great circles, of the sphere are represented by straight lines, for their planes pass through the eye. The distance of two points on the sphere, when measured along the surface, is least if they are measured along a great circle; and as the distance of the projections of these points on the plane is represented by a straight line, which is the shortest distance between two points on a plane, this projection, if employed in the construction of mariners' charts, would at once show the shortest course. Maps of the earth's surface have been projected by the gnomonic method, the surface of projection being the interior surface of a cube circumscribing the sphere, and the complete series consequently amounting to six maps; but it is not fitted for the construction of maps of large portions of the earth's surface. The gnomonic projection derives its name from its connection with the mode of describing a gnomon or dial (q.v.). The orthographic and stereographic projections were employed by the Greek astronomers for the construction of maps of the heavens; the former, or *analemma*, being the best-known and most used. The stereographic, called *planisphere* by the Greeks, is said to have been invented by Hipparchus, and the gnomonic is described by Ptolemy. The others are of modern invention.

In mathematics, the theory of projections is general in its application, and has been employed within the last few years to generalize the ancient geometry, and as a powerful aid to algebra. Its basis is the investigation and determination of those properties which, being true of a figure, are also true of its projections, such properties being necessarily dependent, not on the "magnitude," but on the "position" of the lines and angles belonging to the figure. These properties are generally denominated *projective properties*. For instance, the three conic sections, the parabola, ellipse, and hyperbola, are merely various projections of a circle on a plane, and all "positional" properties of the circle are at once, by this theory, connected with similar properties of the three conic sections. The theory is also largely employed in demonstrative mechanics.—See, for further information, Mulcahy's *Modern Geometry*, Salmon's *Conic Sections*, Monge's *Géométrie Descriptive*, Poncelet's *Propriétés des Figures Projectives*, and Poisson's *Traité de Mécanique*.

PROLAPSUS ANI is a common affection of the termination of the intestinal canal, and consists in an eversion of the lower portion of the rectum, and its protrusion through the anus. It may depend on a naturally relaxed condition of the parts, as in infancy, or may be caused by violent straining in cases of costiveness, piles, etc. Whenever it occurs, the parts should be washed, and, if possible, replaced by careful pressure with the hand; and if they do not easily return, the forefinger should be oiled, and pushed up into the anus, and it will convey the protruded intestine with it, after which the patient should retain the recumbent position for some hours. If it cannot be returned by the above means, surgical assistance should be at once sought. In order to remove the tendency to prolapsus, the patient should regulate his bowels so as to avoid costiveness, should sponge the parts after every evacuation with cold water or soap and water; and, if necessary, use astringent injections, as, for example, a weak solution of sulphate of iron, one grain to the ounce. Dr. Druitt (in his *Surgeon's Vade Mecum*) recommends a

plan first suggested by Dr. McCormac—namely, that when the stools are passed, the skin near the anus should be drawn to one side with the hand, so as to tighten the orifice. If, after the adoption of these means, the bowel continues to descend, certain surgical means must be resorted to, as destroying a small portion of the relaxed mucous membrane by the application of nitric acid, or pinching up a few folds of the protruded membrane with the forceps, and applying ligatures to them.

PROLAPSUS UTERI—known also as **PROCIDENTIA** or **DESCENSUS UTERI**, by writers on the diseases of women; and as “falling down of the womb,” or “bearing down,” among non-professional persons—consists essentially in a depression of the womb below the natural level in the pelvis. It is a common affection amongst all ranks, and is most frequent in women beyond the middle age who have borne large families. It has, however, been met with in women who have not borne children, in virgins, and even (although very rarely) in children. It may occur in every degree, from the case in which the mouth of the womb is a little lower than its natural level, to that in which the womb itself projects externally, and forms a protruding tumor as large as a melon. In the latter case, it displaces by its traction the bladder, rectum, and other important structures. The prolapse is termed *imperfect* as long as there is no external protrusion, and *perfect* when the womb is protruded externally. The causes of these different degrees of prolapse are the same, and the symptoms differ only in intensity. The immediate causes are, according to sir C. Clarke: (1) Relaxation of the ligaments of the uterus; (2), a want of due tone in the canal leading from the uterus to the external surface. The latter is probably the chief cause. After many child-bearings, it remains dilated, and its walls lose their resisting power. Similar effects result from repeated uterine hemorrhage, leucorrhœa (popularly known as the *whites*), and general debility. Under these conditions a very slight downward force will depress the womb; and this force is supplied by the increased weight of the organ itself, if the patient sit up or walk soon after delivery, by violent vomiting or straining (when the bowels are constipated), by the endeavor to lift heavy weights, etc.

The symptoms arise partly from the pressure of the womb on other organs, partly from the simultaneous displacement of adjacent parts (as the bladder, rectum, etc.), and partly from reflex action (see **NERVOUS SYSTEM**). Patients with only a slight displacement usually complain of a sensation of fullness in the pelvis, of weight and bearing down, of dragging from the loins, often amounting to pain in the back, these symptoms being aggravated when the upright position is assumed. Strangury (q.v.) is occasionally present, and if the womb descend low or protrude, there is always more or less difficulty in evacuating the contents of the bladder and rectum. The digestive organs soon become affected through reflected nervous influence. It is a remarkable fact that the general health is often much worse in those cases in which there is a slight depression than in those in which the prolapse is complete, and the womb forms an external tumor.

The treatment varies with the degree of displacement. In the milder cases, medicine should be administered with the view of giving tone to the mucous membrane of the relaxed canal; while in the severe cases, mechanical support is requisite. In comparatively mild cases, prolonged rest in the horizontal position should be enforced, and cold water (from half a pint to a pint) should be slowly injected, night and morning, into the canal leading to the uterus, by means of an elastic bottle, the patient being in the recumbent position as she receives the injection. If this treatment is insufficient, astringent injections, as decoction of oak-bark or of galls, or a solution of alum (an ounce to the pint of water), should be tried. If, however, there is any congestion or inflammation of the parts, astringents must be avoided. In a case of complete prolapse, the first duty of the practitioner is to attempt to restore the womb to its natural position. It is sometimes necessary to place the patient in a warm bath, or to apply fomentations or leeches to the tumor before it can be replaced; and occasionally, irreducible cases occur, in which it may be necessary to remove the organ altogether. But suppose it returned to its position, a repetition of the prolapse has to be prevented. The ordinary method is by the introduction of a pessary—an instrument of an oval or globular form, and usually made of box-wood, which mechanically supports the uterus in its normal position. See the works of Churchill, West, and others *On the Diseases of Women*. In some cases a compress and bandage will afford sufficient support; while in other cases a surgical operation similar to that which is performed for *prolapsus ani* (q.v.) is expedient.

PROLÉTAIRES, a term used by the French (from whom it has been partially adopted by recent English and German writers) to denote the lowest and poorest classes of the community. It is derived from the Latin *proletariū*, the name given in the census of Servius Tullius to the lowest of the centuries, who were so called to indicate that they were valuable to the state only as rearers of offspring (*proles*).

PROME, a t. in the British territory of Pegu, on the left bank of the Irrawaddy, 113 m. n.w. of Pegu; pop. 30,000. It is surrounded by a brick wall, palisade, and ditch, about 2 m. in circuit, and outside of these are extensive suburbs. South of the town are many pagodas on small but steep hills. On account of the flatness of the ground on which it stands, the town is often inundated from the river. In 1856 nearly the whole of the town was destroyed by fire. It has many advantages for trade. Paper is made

here, and in the adjacent country are extensive gardens and rice grounds. The town was taken by the British in 1825 and 1852. It is called by the Burmans *Pei* and by the Mohammedans *Prova*.

PROMETHEUS (Forethought), the son of the Titan Iapetus and of Clymene, brother of Atlas, Menœtius, and Epimetheus (Afterthought)—or, according to other legends, the son of Iapetus and Asia, or of Uranus and Clymene, or of Eurymedon and Here—the father of Deucalion, Hellen, Lyncus, and Chymœrus. The myth of Prometheus is one of the oldest of Greek antiquity, being mentioned by Hesiod, and is briefly as follows: Once, under the reign of Zeus, men and gods were disputing with one another at Mecone; Prometheus, with a view to outwit Zeus, cut up a bull, and divided it into two parts, hiding the meat and the intestines in the skin, and putting a bad piece (the stomach) at the top of it; while he laid in another heap the bones, which were covered with fat. Zeus pointed out the unequal division, but was asked to choose, whereupon he guessed the deceit practiced, and selected the good portion; but, irate at the stratagem, he avenged himself on the mortals by withholding from them the fire necessary for the cooking of the meat; whereupon Prometheus stole it in a hollow staff and brought it to them. Zeus, to punish the mortals, caused Hephæstus to mold a virgin of rapturous beauty, Pandora, whom Epimetheus was unwise enough to receive as a present from Hermes; and thus brought, through her box, all imaginable ills that flesh is heir to upon humanity. Prometheus himself was chained to a rock, and an eagle sent to consume his liver in daytime, while Zeus caused it to grow again at night. Heracles, however, killed the eagle, and, by the permission of Zeus, delivered the suffering Prometheus. Thus far Hesiod's legend. Æschylus, in his tragedy with the name of the hero, has perpetuated another view of the myth. Prometheus, according to him, is an immortal god, a friend of the human race, who does not shrink even from sacrificing himself for their salvation. He is the long-suffering hero, who, although overcome by Zeus's superior might, yet does not bend his mind. He at first assists Zeus against his own kindred, the Titans, and even opens his head at the birth of Minerva. But when Zeus, having come to the throne, conceived evil plans against mankind, wishing to destroy them entirely, in order to create a new race, Prometheus throws himself into the breach; and while taking from them the evil gift of foreseeing the future, gives them the two infinitely superior gifts of hope and of fire. He is the inventor of architecture, astronomy, writing, figures, medicine, navigation, the mystery of prophecy, the arts of working in metal, and all other arts which embellish and adorn life. For these boons conferred on the human race, he is, by Zeus's order, chained to a rock in Scythia by Hephæstus, who fulfills this task reluctantly. Here he is visited by the Oceanides, by Io, who tells him of her own miserable wanderings, and by Hermes, who endeavors to find out that which Prometheus only knows, viz., who will be the son of Zeus and his successor. Refusing to divulge this secret, he is struck by Zeus's lightning, and hurled into Tartarus, whence he only reissues after a time to undergo new sufferings. He is now fastened to mount Caucasus, and the eagle, an offspring of earth and Tartarus, comes to torment him daily. Cheiron, the centaur, at last offers himself to supply Prometheus's place in hades—for on no other condition was he to be liberated than that some other immortal should offer himself in his stead. Cheiron, incurably wounded by Heracles, is accepted by Zeus.—Other legends give varying accounts. One makes Prometheus the creator of man out of earth and water—Zeus having, after the flood of Deucalion, ordered both him and Here to make man out of the mud left, and the winds to breathe life into them; and at Panopeus, in Phocis, a piece of that creative earth was in after-times shown to the wonder-struck multitude. It was also at his suggestion that Deucalion and Pyrrha built the vessel that bore them safely through the floods. Prometheus had a sanctuary at Athens, and torch-races took place in his honor. Many have been the explanations of this myth, one of which is, that it represents the human mind, which, in the consciousness of its own power, refuses to obey implicitly the will of Zeus; another, that it embodies the first struggles between the ancient (Pelasgian) powers of nature and the awaking of the mind, as represented by Zeus and the Olympians, etc. The subject is fully discussed in works on Prometheus by Welcker (1824), Weiske, Schömann, and Lasaulx (1845).

PROMISE, in English law, is often used to denote one side of a contract or agreement, either by word of mouth or in writing which is not under seal. In England, an action cannot be brought on a promise unless some consideration was given for it; but in Scotland a consideration is not necessary, provided the promise was made in earnest and with deliberation. A promise of marriage means a mutual promise, each being an equivalent for the other; and accordingly, if one breaks the promise, the other can sue for breach of it. See **MARRIAGE**.

PROMISE, in law (*ante*), the act of one party to a contract or agreement by which he engages to perform something of advantage to the other party, who is called the promisee. A naked promise is one without consideration, and therefore of no legal effect at common law, unless contained in a sealed instrument; and in most of the states the presumption raised by the seal may be overthrown by proof that there was no consideration. A promise may be *conditional*, in which case the condition must be complied with before the promise is binding, or it may be *implied*, where the law considers the party liable on account of acts or omissions on his part, though there has been no

express undertaking by him. For what constitutes a valid promise of marriage see MARRIAGE, *ante*. Promises to do acts contrary to public morality or in aid of crime are, of course, void. When the fulfillment of the promise is prevented by the act of God or the promisee, the promisor is no longer bound. A confession obtained from a prisoner under arrest, by means of promises that he shall be released or favored in any way, is inadmissible in evidence, and very slight evidence of such a promise has been sometimes received.

PROMISSORY-NOTE is a contract by which A, the promiser, agrees to pay B, the promisee, a sum of money, either on request or on a future day. A is called the maker of the note, and B the payee of the note. The law affecting notes is substantially the same in all respects, and is always treated as part of that of bills of exchange (q.v.).

PROMISSORY NOTE (*ante*) must be in writing, without seal, and bearing the maker's signature, containing a promise to pay a certain sum of money absolutely at a certain time, and made payable to the bearer, or to a definite payee or order. As soon as a promissory note is indorsed, it is exactly like a bill of exchange. The maker corresponds to the acceptor, the indorsee to the payee, and the indorser to the drawer. The rules of law in regard to the liability of the parties, the time and place of payment, transfer and indorsement, defenses, notice, etc., are identical in the case of promissory notes and bills of exchange. See BILLS OF EXCHANGE.

PROMOTION, a term which has been applied to the granting of a degree by a university. The practice of conferring the title of doctor, by authority and after examination, seems to have originated in the university of Bologna, in the middle of the 12th century. Degrees were at first conferred by *cooptation*, i.e., admission by the common consent of the body of doctors; but in the beginning of the 13th c. Honorius III. placed promotions under the control of the archdeacon of Bologna.

PROMOTION, in the ARMY and NAVY. The efficiency of any body of men depends upon the energy of the individuals composing it; the root of that energy is emulation, and emulation can only be secured by maintaining a proper current of promotion. The efficiency of a service is thus dependent on the system of promotion adopted; and so important, consequently, does promotion become, that in the present article it is proposed to glance at the rules observed in the principal armies of the continent before describing the system which obtains in the British service.

In the *army of France* it is every common saying that every conscript has a marshal's *bâton* in his knapsack. Speaking of the times of the revolutionary war, this was doubtless true for battalions chose their chief officers from their own ranks—a conscript of one year was often a lieutenant-colonel, the next, and perhaps a brigadier, the following. In the quieter times of recent years, however, progress is slower; and, although promotion is open to all, and a considerable proportion of the officers do rise from the ranks, yet it is very rarely indeed that an officer who has so risen ever attains a higher grade than that of captain. Junior commissions are—if the rule of the service were strictly followed—given, one-third to men from the ranks, one-third to cadets from the military schools, and one-third by government patronage. In practice it appears that in the artillery and engineers two-thirds of the first commissions are given to pupils from the Polytechnique, and the remainder to men from the ranks; while in the line two-thirds of the officers rise from the ranks, and one-third come from the military school of St. Cyr. Before officers can be promoted certain service in each rank is required, viz., as 2d lieutenant, two years; as lieutenant, two years; as captain, four years; as major, three years; and as lieutenant-colonel, two years. These periods are, however, curtailed in time of war. Promotion takes place in the regiment up to the rank of captain, two-thirds by seniority, and one-third by selection. From captain to major (*chef d'escaadron ou de bataillon*), promotion is divided equally between seniority and selection; while to all higher ranks it falls exclusively to selection. The selection is made on reports by the inspectors-general of the several arms—their reports being founded on personal observation, and the testimony of senior regimental officers. To maintain rapidity of promotion there is a fixed age at which officers *must* retire—viz., lieutenant-general, 65; major-general, 62; colonel, 60; lieutenant-colonel, 58; major, 56; captain, 53; and lieutenant, 52. These ages do not prevent the officers of a regiment from being the opposite of youthful.

In *Austria* all officers are at first cadets; but a large proportion of these cadets are nominated from men in the ranks by their comrades. Promotion goes by seniority, and in the regiment, with occasional selection from other regiments.

The organization and officering of the German army are both peculiar. Every German subject, of whatever rank, is bound to serve from the age of 20 to 25; but in practice this service is reduced to a year in the case of professional men. Every officer must serve in the ranks, but not necessarily for more than a day. Young gentlemen intended for officers enter the ranks as *aspiranten*. They do duty as common soldiers for from six to nine months, and pass two examinations. Afterward they remain nine months at a division school, or twelve months at an artillery and engineer school. They then become eligible for appointment as officers when vacancies occur, which, however, they cannot obtain unless recommended by the officers of their respective regiments. Two-thirds of the first commissions are given to these aspiranten, and one-third to pupils from the cadet schools.

In the *Italian* army, one-third of the sub-lieutenants are promoted from the ranks. Of subsequent promotion, two-thirds go by seniority, and one-third by selection.

It is always urged against the *British* system of army promotion, that it is too exclusive, and confines the commissions to the upper classes of society; and there is no doubt that promotion from the ranks is much rarer than in almost any other army. But, on the other hand, it is argued, the constituents of the force are very different. Soldiers in Britain are not conscripts, who necessarily comprise men of all classes and all degrees of education, but are taken, as a rule, from an extremely low and very uneducated class of society. Again, Britain has a true middle class, which is wanting in almost every continental nation. Its army is not, therefore, necessarily aristocratic because it is not officered from the ranks. Lastly, the habits of the different classes of society differ so greatly, that unless the soldier be very superior to his comrades, promotion to a commission is a small boon.

With regard to the actual system of promotion which obtains: in the ranks, promotion from private up to company-sergeant takes place in the company, and is made by the regimental officers. The promotion of company-sergeants to be staff-sergeants is made throughout the regiment. All these promotions are by selection entirely. Of the commissioned officers, the quarter-masters and riding-masters are appointed almost exclusively from the ranks; but they have no further promotion to look forward to—sergeants and sergeants-major are occasionally gazetted to ensigncies or lieutenantcies. The junior combatant officers acquire their commissions either by a competitive examination open to the whole nation, or by previous service in the militia as officers, or in the ranks of the army as non-commissioned officers. The artillery and engineers are officered entirely by cadets from the royal military academy, whose subsequent promotion is by seniority only. In the cavalry, guards, and line, vacancies are, since the abolition of the purchase system in 1871 (see PURCHASE SYSTEM), filled by "seniority tempered by selection;" the selection becoming more strict as the higher ranks are reached. The promotion of officers, up to the rank of captain, is mainly regimental, and is, at the same time, by seniority; but seniority is, in this case qualified by what has been called negative selection—that is, in other words, the exclusion of those officers who do not prove their fitness for promotion at the periodical inspections and examinations. Above the rank of captain, for *substantive* or *regimental* rank, seniority is little regarded, and selection is more absolute; but officers may hold at the same time *army* or *brevet* rank, conferred for distinguished service, or for mere seniority, in the general list of the whole army. This brevet rank does not affect the position in a regiment, and adds but a small sum to the officers' pay; but it is of great importance, inasmuch as colonels rise by seniority alone to be general officers, and colonel is almost exclusively a brevet rank (the only exceptions being in the artillery and engineers, where colonel is a regimental rank). Under these rules, it sometimes happens that an officer who has never held higher regimental rank than captain, may become successively, for good service, brevet-major, brevet-lieutenant-colonel, and brevet-colonel, until he succeeds, in his turn, to the rank of major-general. See also STAFF.

In the navy, the promotion of sailors to be petty officers is made by the captain of the ship; petty-officers are appointed to be warrant-officers by the admiral of the station, subject to admiralty confirmation. The commissioned officers are appointed, and promoted by patronage solely. When a ship is first commissioned, the captain is allowed to nominate one cadet, the admiralty name the rest. Promotions are made by selection by the admiralty, except death vacancies which occur abroad; these are filled up by the admiral commanding on the station from the officers of his fleet. Above the rank of captain, all promotions take place by absolute seniority. There is no purchase of commissions in the navy.

PRONAOS, the area or space before the cell of a temple, through which it was entered.

PRONG-HORN, or PRONG-HORNED ANTELOPE, *Antelope furcifera*, *dicranocerus furcifer*, or *antilocapra Americana*, a species of antelope inhabiting the great western prairies of North America. It is the *cabrit* or *cabree* of the Canadian voyageurs, is also called *goat* by the fur-traders, and sometimes receives the name of *spring-buck*. It is common between the Saskatchewan and the Missouri, and also on the Columbia, and is found in plains and on low hills, where there is no wood, or only scattered clumps of trees; never in mountainous districts, nor in forests. Its size is nearly that of the roe; in its general form and gait it resembles the chamois. In summer the hair of the prong-horn is smooth and flexible, but as winter approaches it lengthens; each hair becomes thick, its interior becomes white and spongy, and it loses its flexibility, at last becoming brittle, so that its point is easily rubbed off; but this singular fur forms a very close and warm covering for the animal. The prong-horn is generally seen in small herds, sometimes solitary. It is very curious about any strange object, and advantage is sometimes taken of this by Indian hunters, who crouch, run a few yards, and stop again; the prong-horns wheeling around them, coming nearer, and becoming still more curious, till they are within shot.

PRONOUNS, one of the classes of words or parts of speech, possessing a special interest both logical and philological. "I am sick." "Thou knowest the truth." "John

was here, but *he* went away again." "Peter struck the boy, *who* had done *him* no harm." "*What* do you want?" The words in italics in these sentences are called *pronouns*, because they stand for (Lat. *pro*) nouns, or names of persons and things; and they are generally said to be used to prevent the too frequent repetition of the nouns. Yet the pronoun and the noun are not exact equivalents for each other. No noun can be an exact substitute for *I*, *thou*, or *who*. Pronouns are symbols, names, or highly generalized marks, applied to objects to signify, not any inherent attribute, but merely *their relations to the act of speaking*. They might therefore be called *relational names*. *I*, for instance, is a name applicable to all subjects that can be conceived as speaking. In such a sentence as "*I* am sick," in which the state, "*sick*," is affirmed about some one, the exact force of *I* may be thus expressed: The person of whom "*sick*" is affirmed is one with the person making the affirmation. Who the individual person is, the pronoun *I* gives no indication; it is implied that this is known from some other source. Those present learn it by hearing whence the sound comes; in a book, it is gathered from the context.

In like manner, *thou* is a generalized name for all persons spoken to. What it means or *connotes* is—with reference to the example above given—that the person affirmed to know the truth, and the person to whom the affirmation is addressed, are one and the same. What particular person it *denotes* must be learned, as before, from circumstances. If the clause, "*he* went away again," stood by itself, what person is denoted by *he* would be still more vague than in the case of *I* and *thou*. *He* merely implies that a person, neither the speaker nor the spoken to, but one known in some way, is the subject of the assertion. Who it is, is determined, in the example, by *John*, with which *he* stands in close relation. *Who* designates some person already named, referring us back to that name (the *antecedent*) for determining the individual. *What* connotes that the subject is unknown.

Pronouns are usually divided into personal and relative.

1. *Personal Pronouns*.—The several objects concerned in a speech or sentence stand in one or other of the three relations of speaker (first person), object spoken to (second person), object spoken about (third person). Pronouns expressive of these relations are called personal pronouns. They are (in the nominative case), 1st person, *I, we*; 2d, *thou, ye* or *you*; 3d, *he, she, it, they*.

Along with the personal pronouns, and most nearly related to the pronouns of the third person, may be classed the words *one* and *that* in certain constructions. In phrases like, "*One* cannot be sure of that," *one* is an indefinite pronoun, designating any person whatever. It is distinct from the numeral adjective *one*, being derived from the French *on*, which is a corruption of *homme*, man. When we say, "I like peaches, but let me have a ripe *one*," or ripe *ones*," we have now the numeral used as another indefinite pronoun. The first of these indefinite pronouns is applied only to persons; the second, both to persons and things.

When we say, "Give me *this*, and keep *that*," *this* and *that* may be considered as demonstrative adjectives, with some noun understood—this (thing). But in the expression, "He mistook his own room for *that* of the stranger," *that* appears to be as much a pronoun as *one*.

2. *Relative Pronouns* (including *Interrogative*).—Relative pronouns, besides standing for nouns, have the power of conjunctions. They join sentences and clauses, by relating or referring back directly to something just named. The relatives in English are three—*who, which, and that*. See RELATIVE PRONOUNS.

What is used for *that which*, thus embracing both relative and antecedent. In phrases like "such a storm *as* now burst on them," *as* is used with the force of a relative pronoun. Perhaps the full expression would be "such a storm as (the storm that) burst."

3. *Interrogative Pronouns* are those used in asking questions; they are *who, which, and what*.

These are the *simple* pronouns. But a variety of compounds are formed by joining these simple pronouns with other words, such as *himself, whatever, any one*.

Pronouns, as we have seen, express the most abstract relations in language. They are, in fact, the most attenuated and colorless signs of thought conceivable—the highest effort, apparently, of man's generalizing powers. Accordingly, in the days of purely *a priori* speculation on the origin and growth of language, it was held to be indisputable that pronouns must have been the latest product of the language-making faculty; and they have been appealed to as a conclusive argument against the theory that the meaning of all words, when they are traced to their origin, is grounded on sensible properties and relations of material things. The philologist, on the contrary, pursuing his investigations on the historico-comparative method, sees irresistible proof that pronouns, in the Aryan family of languages at least, were among the earliest words in use. In fact, besides their independent use, the same elements are found as suffixes forming the inflections (see INFLECTION) of the predicative roots, and first making them real words capable of entering into a sentence. In the beginning, however, they were far from being the impalpable abstractions they afterward became, and really form the strongest proof of the theory they were supposed to upset. They were, in fact, simply demonstrative particles, indicating palpable relations of space or position ("that" or "there,"

"this" or "here," "what" or "where?"). We can easily see how the indication of the vocal sign would at first be helped out and made precise by gesticulation; or more probable still, the gesticulation was at first the fundamental sign, and the word a natural involuntary utterance accompanying it, and in process of time taking its place.

Of the various demonstrative radicals still traceable in the Aryan tongues as pronouns and suffixes, one of the most universal and outstanding is the sound *tu* or *sa* for "that" or "this," "there." It is seen in the Sanskrit *sa* (mas.), *sā* (fem.), *tad* (neut.); Lat. (*is*)*te*, (*is*)*ta*, (*is*)*tud*; Gr. *ho*, *he*, *to*; Goth. *sa*, *sō*, *thata*; A.-S. *se*, *seō*, *thut*; as also in the numerous allied adverbs, e.g., Lat. *tam*, *tunc*; Ger. *dann*; Eng. *so*, *as*, *then*, *thus*. Another demonstrative radical, *ma*, seems to have been used to call attention to the speaker—to point to the immediate or central "here;" in short, to the "me." Besides occurring in the oblique cases of the first personal pronoun, the element *ma* or *m* enters largely into the suffixes of the first person of verbs in the older languages, such as Greek and Latin. The only remnant of it in English is in *I am*. The nominative case of the first person pronoun in Sansk. is *ahām*, which is conjectured to be a mutilation of a fuller form *ma-gha-m*; in Gr. and Lat. *ego*, Goth. *ik*, Ger. *ich*, A.-S. Eng. *I*, Ital. *io*, Fr. *je*, the *m* has completely disappeared. In the oblique cases it has been better preserved. The root of the 2d pers. pron. seems to have been the syllable *tu* or *tea*, indicating a position intermediate between the central "here" and the more distant and contrasted "there." The form of this pronoun is more constant throughout the allied languages than that of any other: Sansk. *tūm*, Lat. *tu*, Gr. *ty* or *sy*, Ger. *du*, Eng. *thou*, Fr. *tu*, Ital. *tu*.

The pronouns of the first and second persons are invariable in respect of gender, and are never used as adjectives; the pronouns of the third person not only take the form of adjectives in respect of gender, but are often—especially in the older languages—joined to nouns, in which case they are rather demonstrative (or relative) adjectives than pronouns; as Lat. *ille homo*, Eng. *that "man."* It is difficult to trace any etymological relations between the singular and the plural in the first and second pronouns—e.g., between Lat. *tu* and *vos*, or Eng. *thou* and *you*; but this is not to be wondered at when we reflect that "we" is not equal to "I" and "I," but to "I" and "he," or "I" and "thou;" and that "you" is as much "thou" and "he" as "thou" and "thou." The plurals must therefore have been compounded of several elements, which, by coalescence and abrasion, have become irrecoznizable.

The declension of the English personal pronouns is to be found in any elementary grammar. That of the third person is made up of fragments of several Anglo-Saxon words. The Anglo-Saxon pronoun was thus declined:

Sing. Nom.	<i>he</i> (hē), <i>heō</i> (she), <i>hit</i> (it)
Gen.	<i>his</i> <i>hīre</i> <i>his</i> ,
Acc.	<i>hine</i> <i>hi</i> <i>hit</i>
Dat.	<i>him</i> <i>hire</i> <i>him</i>
Plur. Nom. Acc.	<i>hi</i>
Gen.	<i>hira</i> (heora)
Dat.	<i>him</i> (heom)

The cases marked in italics are still used in modern English, only that *him* and *her* do duty in the accusative as well as dative. *His*, as the genitive of the neuter, has been supplanted in recent times by the secondary genitive *its*, a word which does not occur once in the English version of the Bible. *She* does not represent the Anglo-Saxon *heō*, but *seō*, the feminine of the article. The modern plurals *they*, *their*, *them*, have no direct etymological connection with the singular *he* (she, it); they are taken from the demonstrative or article *that* (that, the), which has, in the plural, nominative and accusative *thā*, genitive *thāra*, dative *tham*. *Ihem*, like *him*, was thus originally a dative case. Is it a lingering memory of the demonstrative origin of *them* that keeps alive the vulgar error of "them things?"

Such being the arbitrary, or rather chance way in which the English pronominal system has been built up out of the wrecks of the Anglo-Saxon, there is no good reason why *them*, *him*, *her*, should not have been used in the nominative as well as in the accusative; and, in fact, in certain connections, these forms, together with *me*, are habitually so used, although grammarians have hitherto refused to sanction the usage. Such expressions as, "It is me;" "better than him, than them," etc., are not confined to the uneducated; in familiar conversation the most cultivated use them habitually, and in preference to what are considered to be the correct forms, which are felt somehow to be stiff and pedantic. This usage has the analogy of the French in its favor (e.g., *c'est moi*), and some English philologists have begun to defend it on principle. See Alford, *The Queen's English*.

From politeness and other rhetorical motives, various substitutes take the place of the usual personal pronouns. The English language departs little from the normal usage, except in *you* for *thou*, and in the regal and editorial *we*. A French shopkeeper, instead of "What do you wish to see?" says: "What does the gentleman (or lady) wish to see?" All modern languages use such substitutions as, "Your majesty, your excellency, wishes;" but the Italian, in speaking further of the excellenza, says: "It (*ella*, *she*)

wishes." The Germans use regularly *they (sie)* for *you*, and one never hears *you* except from the pulpit. In Hebrew politeness took the form of saying: "Thy servant said," for "I said." Similarly, the Chinese use: "little man, subject, thief, blockhead," for "I," and an American backwoodsman speaks of himself as "this 'oss," or "this here child."

PROOF. See EVIDENCE.

PROOF OF FIRE-ARMS. Guns of all descriptions are proved before being issued for service. Muskets are tested by being fired with heavier bullets and larger charges of powder than they will in the ordinary way be required to carry. Cannon are subjected to a series of tests. First, they are gauged to ascertain that the dimensions are correct, the utmost variation permitted being .3 in. externally, and .033 in the diameter of the bore; but the position of the bore may deviate .25 in. from the line of the piece's axis. The next trial is by firing twice with heavy charges—the bore being subsequently minutely examined, to detect flaws or crevices in the metal. A cavity exceeding in depth .2 in., if behind the first re-enforce ring, or .25 if before that ring, condemns the piece. After the proof by firing, water is forced at a great pressure into the bore, in order that it may permeate any honeycombs or flaws; the next day the bore is examined by means of a mirror, which casts a strong light into it. Flaws are then easily detected; for while the rest of the bore is thoroughly dry, water will continue for some time to weep or run from the holes, and will stand over them in drops. This operation completes the proof. When a gun bursts in proof, the remainder of the guns of the same sort then in proof are subjected to another round.

In the case of guns of hitherto untried form, some are tested to bursting, as specimens of the power and endurance of the whole number. For proof of powder, see EPROUVETTE.

PROPAGANDA (Lat. *De Propaganda Fide*, regarding the propagation of the faith), the name of a congregation, and also of a college, in Rome, the object of which is to direct and forward the propagation of the Catholic religion, especially among the heathen; although Christian dissenters from the Roman church are also included in the sphere of its operations. The institution was originated by pope Gregory XIII. (1572-84): but it was fully organized by Gregory XV., who, by a bull of June 22, 1622, established a special congregation for this purpose, which his successor, Urban VIII., extended and endowed, and to which he annexed a college for the education of missionaries to the several countries; one great feature of which has been to provide for such work natives of the several countries, who are conveyed to Rome at an early age for the purpose of being specially educated in all the necessary learning of a missionary. The congregation consists of a number of cardinals appointed for life, one of whom is prefect, and who are assisted by a secretary, and by a number of consulters, clerks (*minutanti*); and other officials. This congregation conducts the affairs not only of the missionary countries, properly so called, but also of those—as England, the northern kingdoms, etc.—in which the hierarchical organization is not, or has not been full and formal. The Catholic church in these kingdoms is directly subject to the propaganda in all the details of its government. The college of the propaganda is a noble institution, containing nearly 200 pupils of all countries, tongues, and complexions, who are not only maintained and educated gratuitously from a very early age, but are equipped and sent forward to their several destinations at the charge of the institution. The operations of both college and congregation have been somewhat embarrassed by diminution of funds, consequent on the appropriation of ecclesiastical property to public purposes in the kingdom of Italy; but the want is in a great measure supplied by voluntary offerings. The propaganda college contains a most valuable library and museum, and a polyglot printing-press. Its great festival is the epiphany of our Lord, or of his "manifestation to the Gentiles;" and this feast is celebrated by an exhibition of exceeding interest and curiosity, in which are delivered recitations in every language represented in the college or its missions, amounting often to 50 or 60. Of this festival the celebrated cardinal Mezzofanti (q.v.) used to be the guiding spirit. It continues to be one of the chief literary sights of the Roman winter.

PROPAGATION OF THE FAITH, ASSOCIATIONS FOR ROMAN CATHOLIC. The earliest and the highest in dignity of these has been already described under the head PROPAGANDA (q.v.). But the present century has produced several private associations, the resources of which arise almost entirely from voluntary annual contributions, and the organization of which is most complete and most extensive. The first of these is that founded at Lyons in 1822, under the title "Œuvre de la Propagation de la Foi," with a branch at Paris, and subordinate branches in the other Catholic kingdoms. It is under the direction of a council at Lyons and Paris, which communicates as well with the local associations through which the funds are supplied by small weekly, monthly, or yearly contributions, as with the missions to the aid of which the fund so raised is applied, by an appointment regulated according to the necessities of each, especially for the supply of missionaries. The piety of contributors is stimulated by the exhortations of the popes, and the granting of indulgences to those who, with the other requisite dispositions, shall aid in the work. The journal of the society, entitled *Annales de la Propagation de la Foi*, is a very interesting bi-monthly collection of letters and reports in French

from the different missions connected with the central body. The receipts of this association for the year 1863 were 4,788,496 fr., 86 c. Of this sum, by far the largest proportion was raised in France—3,307,248 fr. Italy came next, though at a long interval, contributing 420,653; Belgium gave 271,597; Germany, 251,873; the British islands, 127,000. The Franco-German war and the changes in Italy produced some diminution of this revenue: but some later years' returns have been even more considerable. Spain, once the great propagator of the Gospel in the New World, contributes very little: but it is to be observed that Spain maintains for her own missionary enterprises a large and liberal establishment in connection with the mission of the Philippines and the South Sea.

Another association of somewhat later date is the "Leopoldiner-Verein," established at Vienna in 1829, for general purposes, but the chief object of which is to assist the missions of German origin, especially in America. This association also has its own journal, entitled *Berichte der Leopoldiner Stiftung*. It is under the presidency of the archbishop of Vienna, but has extensive foreign relations. A third is that established in Bavaria as an offshoot of the Lyons association, under the name "Ludwigs Missions-Verein." Like that of Vienna, its chief, although not exclusive object, is the support of German missions. The Ludwigs-Verein is conducted under the auspices of the archbishop of Munich. All these associations, although quite independent in their management and direction, nevertheless maintain close relations with the propaganda of Rome, and are often guided by the recommendations of the cardinal prefect in the distribution of their funds to particular missions.

PROPER, in heraldry. A charge borne of its natural color, is said to be proper. An object whose color varies at different times and in different examples, as a rose, which may be white or red, cannot be borne proper.

PROPERTIUS, **SEXTUS AURELIUS**, an eminent Latin poet; b. as supposed about 56 B.C.; died 16 B.C. There are reasons for believing that his native place was Mevania, in Umbria. He belonged to the equestrian order, and his family was, like many others who had supported the cause of Antony, deprived by Augustus of their estate. Propertius studied at Rome intending to devote himself to the bar, but soon abandoned the law for poetry. He was the friend of Ovid, Mæcenas, and Tibullus. He left a collection of elegies divided into four books. In the first three he sings of his beloved Cynthia; the fourth is occupied chiefly with heroic and religious legends. He was sometimes called the Roman Callimachus. His elegies were formerly printed with those of Catullus and Tibullus, as in the *Editio Princeps*. The best later edition is that of Hertzberg, Halle, 2 vols. They have been translated into French, German, Italian, and into English by Oxford scholars.

PROPERTY, in law, the right and interest of a person in anything the subject of ownership. It must be a right exclusive of the right of others, for some things, as air, the sea, etc., cannot be exclusively enjoyed. Property is either real or personal. It is also absolute or qualified. Absolute property is what is owned without qualification; qualified property is that which a man has over wild animals in his power. Property in things personal may be qualified by the interest of more than one person in it, or by the separation of the possession from the right of property. Personal property is divided into property in possession, and choses in action. See **PERSONAL PROPERTY**. Property is also divided into corporeal and incorporeal; the former comprehending tangible property, the latter rights in property. There are two kinds of qualified property limited in time—one for a definite period, one for the life of the tenant or some other person. Property is lost by operation of law, by abandonment, or by alienation. See **REALTY**, **BALMENT**.

PROPHECY (Gr. *propheteia*) is a word of pregnant signification. According to its usual acceptation in modern English, it implies *prediction*—the telling of events about to happen beforehand. But neither according to the original meaning of the word prophet in Hebrew (*nabi*) or in Greek (*prophetes*), nor according to historical usage of the verb *prophecy* in English, can such a meaning be considered exclusive. The etymological force of the Hebrew word, according to the best authorities, denotes "a person who, as it were, bursts forth with spiritual utterances under divine influence, or simply one who pours forth words." The *nabi* is the medium of special divine communication—according to some, the man inspired by God to whom divine communications are made; but more distinctively, according to others, the man who delivers the burden of the divine thought imparted to him, who makes known the declarations of God. Besides the more authoritative expression *nabi*, there are two other expressions (*voeh* and *chozeh*) used in the Hebrew original with something of the same meaning, and which are translated in our English version "seer." The exact meaning of the several words in their relation to one another has been much disputed. The best view, upon the whole, seems to be that which considers *nabi* to denote specially the official function of the prophet, the *order* to which he belonged; and the other expressions to point peculiarly to the nature of the prophetic gift—the intuition or vision of the divine. The one may stamp more the objective function of the prophet as a *teller* or *utterer* of the divine, the other more his subjective capacity as a seer of the divine.

The original and proper import of the word *prophecy*, therefore, may be said to be

the utterance of the divine. The prophet is the "interpreter of the divine will." He is expressly called "the interpreter and the messenger of Jehovah." The idea of prediction is not of course excluded; but this idea is not a radical and necessary part of the meaning of the word, nor was it at all necessarily an element of the prophetic office. This is apparent from the use of the word even in our English Bibles and our older theological literature. The sons of Asaph, for example, it is said (1 Chron. xxv. 3) "prophesied with a harp, to give thanks and to praise the Lord," in the sense of merely singing or uttering God's praise under the dictate of the divine Spirit. It is said also of Philip the evangelist (Acts xxi. 9) that he had "four daughters, virgins, which did prophesy," in the sense merely or mainly of declaring the gospel. In like manner, Bacon speaks in his day of "an exercise commonly called *prophesying*," which consisted in the exposition of a portion of Scripture by successive ministers at a meeting appointed for the purpose; and the well-known title of one of Jeremy Taylor's books, *The Liberty of Prophesying*—i. e., the liberty of preaching—recalls the same use of the word.

Prophecy among the Jews was a distinct office or function constituted under the divine sanction. The prophets were an order instituted, or at least reformed and more thoroughly organized by Samuel. There were prophets, indeed, before; Abraham is called a prophet (Gen. xx. 7), and Moses also (Deut. xviii. 15; xxxiv. 10); Aaron is the "prophet of Moses" (Ex. vii. 1), and Miriam is "a prophetess" (Ex. xv. 20); but it was Samuel who first established the office as a systematic part of the Jewish religion. For this purpose, he gathered together companies of young men of promising spiritual attainments, who were trained under his superintendence for various religious duties—the exposition of the theocratic law, and the conduct of the theocratic worship, especially of its elaborate musical departments (1 Sam. x. 5; 1 Chron. xxv. 6). The use of the psaltery and tabret, pipe, harp, and cymbal, was the peculiar business of the prophets. The young men were set apart to make proficiency in these instruments; they were placed under an elderly head or president, who received the name of father, and they were called his sons. They were "all under the hands of their father for song in the house of the Lord, with cymbals, psalteries, and harps, for the service of the house of God" (1 Chron. xxv. 6). The prophetic institutions have been called by modern divines "schools of the prophets;" but this name does not occur in Scripture, nor even in our authorized version. "Sons of the prophets" is the only collective name applied to the separate companies into which they were formed by Samuel. These companies were located in special spots; in Ramah, the birthplace and residence of Samuel; in Bethel, Gilgal, Jericho, and ultimately Jerusalem. They lived in huts made of the branches of trees; wore a simple, characteristic dress; had their meals together, and were found in numbers sometimes of 50, sometimes even of 400. For a prophet not to have been trained in one of these institutions, was deemed as dean Stanley says (*Jewish Church*, vol. i. p. 429), "an exceptional case." Some, like Isaiah in Jerusalem, or Elisha in Samaria, lived in great towns, in houses of their own. The higher prophets had inferior prophets or servants attendant upon them, whose duty it was to pour water upon their hands, and secure provisions for them (2 Kings iii. 11; v. 22). Thus Moses had Joshua and others; Elijah had Elisha; Elisha had Gehazi. Many of them were married, and had families; for example, Moses, Samuel, Deborah, David, Hosea, Isaiah, Ezekiel. The wife was sometimes, as in the case of Isaiah, called "the prophetess."

The prophets, according to this description, were a peculiar order of teachers among the Jews; prophecy, a distinctive part of the divine economy, by which God trained and educated the "chosen people." Beginning in a definite, though still unorganized form, with Moses (for it is only incidentally that Abraham is called "a prophet"), it assumes a regular organization in the hands of Samuel, just when the earlier form of the theocratic government was passing away, and the monarchy was established. It grew up alongside the older institution of the Levitical priesthood without any professed or formal opposition to the latter, but playing a part distinct, and often practically opposed to it. The priests ministered at the altars of sacrifice, and discharged all the official rites of purification enjoined by the Jewish law. They were only secondarily teachers of the people. The prophets, again, while joining in the rites of the tabernacle and temple, were primarily and mainly teachers. Their function was moral, and not ritual; they upheld the ethical, spiritual, and eternal side of religion, apt to be obscured under the hardening tendencies and ambitious officialism of an influential priesthood. They were the great preachers of a righteous government of the world, and of future retribution amidst the confusions and evils of their time; and prophecy was the ever-renewing and reforming element in the constantly corrupting and decaying policy of Judaism. More particularly, the prophets were both the national historians and poets of the Jewish people, the narrators of its past deliverance, the heralds of its coming glories. The books of Joshua, Judges, Samuel, and Kings are included among the prophetic books of the Old Testament in the Jewish canon; while the acts of David, by Gad and Nathan, of Solomon and Jeroboam, by Nathan and Iddo, along with other historical and biographical pieces, have unhappily perished. It is needless to point to the splendid collection of the later prophetic books, beginning with Joel, as containing, along with much direct historical matter also, the most exalted specimens of poetry to be found in any language.

But that which by many has been supposed to be the distinctive character of

prophecy, and the special function of the prophets, remains to be noticed. According to the general view of theologians in modern times, prophecy is peculiarly *predictive*, and the essential characteristic of the prophet is supposed to be the power of *foretelling future events*. This view is not warranted, we have seen, either by the etymology of the word, or a comprehensive survey of the facts; but it is, nevertheless, undeniable that the Hebrew prophets directed their attention especially to the future, and "made predictions concerning the fortunes of their own and other countries which were unquestionably fulfilled." "There can be no reasonable doubt, for example," writes one of the most liberal of modern theologians, "that Amos foretold the captivity and return of Israel, and Micah the fall of Samaria, and Ezekiel the fall of Jerusalem, and Isaiah the fall of Tyre, and Jeremiah the limits of the captivity. It was the distinguishing mark of the Jewish people," adds the same writer, "that their golden age was not in the past, but in the future; that their greatest hero (as they deemed him to be) was not their founder, but their founder's latest descendant. Their traditions, their fancies, their glories, gathered round the head, not of a chief, or warrior, or sage that had been, but of a king, a deliverer, a prophet, who was to come. Of this singular expectation, the prophets were, if not the chief authors, at least the chief exponents."* The reality of a succession of Messianic predictions is admitted by even very advanced theologians; and the more usual opinion, it is well known, regards these predictions from the time of Moses to the time of Malachi as admitting of no question, from the supposed clearness, fullness, and particularity with which they announce a deliverer, and describe his functions. "That salvation should come through the family of Abraham, Isaac, Jacob, Judah, David; that at the time of the final absorption of Jewish power, Shiloh (the tranquilizer) should gather the nations under his rule; that there should be a great prophet typified by Moses, a king descended from David, a priest forever typified by Melchizedek; that there should be born into the world a child, to be called Mighty God, Eternal Father, Prince of Peace; that there should be a righteous servant of God on whom the Lord should lay the iniquity of us all; that Messiah, the Prince, should be cut off, but not for himself; that an everlasting kingdom should be given by the Ancient of Days to one like the Son of Man. It seems impossible to harmonize so many apparent contradictions. Nevertheless, it is an undoubted fact, that at the time seemingly pointed out by one or more of these predictions, there was born into the world a child of the house of David, and therefore of the family of Abraham, Isaac, Jacob, and Judah, who claimed to be the object of these and other predictions; who is acknowledged as Prophet, Priest, and King, as Mighty God, and yet as God's righteous servant, who bears the iniquity of all; who was cut off, and whose death is acknowledged not to have been for his own, but for others' good; who has instituted a spiritual kingdom on earth, which kingdom is of a nature to continue forever, and in whose doings and sufferings on earth a number of specific predictions were fulfilled. Then we may say that we have here a series of prophecies which are so applicable to the person and earthly life of Jesus Christ, as to be thereby shown to have been designed to apply to him; and if they were designed to apply to him, prophetic prediction is proved."—Smith's *Dictionary of Bible*, art. Prophecy.

Such is the common view of prophecy. It has, indeed, been maintained by certain writers that *literal prediction* has no place in prophecy; that Isaiah did not foretell the Babylonian captivity, or the fall of Tyre, nor Jeremiah the seventy years' captivity, nor Nahum the ruin of Nineveh; and that the Messianic prophecies were merely "ardent hopes and poetical descriptions" of a glorious future, into which the prophetic mind naturally projected itself. Such delineations were "in essence nothing but *forebodings*—efforts of the spiritual eye to bring up before itself the distinct form of the future: to make such presentiments into *historical declarations* is to mistake their character."—Davidson's *Introduction*, vol. iv. But this is not the ordinary theory of prophecy, either among Jews or Christians. Both alike recognize the reality of the predictive element, however differently they may interpret and apply the prediction. They contend not only for a special spiritual elevation in the prophet—an intenser degree of the same divine intuition which God gives to all who worship him in love and reverence—but for a gift of light vouchsafed to him different from any ordinary endowment. Prophecy is not merely the effluence of the divine Spirit enriching and exalting all the natural faculties, but it is the direct communication of God himself, to the prophet unveiling the future for the guidance of his church, and the glory of his name.

The further study of the subject may be pursued by readers in numerous volumes, among which the following may be recommended: John Smith, *Select Discourses on Prophecy*; Lowth, *De Sacra Poesi Hebræorum*; Davison, *Discourses on Prophecy*; Butler, *Analogy of Religion*; Horne, *Introduction to Holy Scripture*; Eichhorn, *Die Hebräischen Propheten*; Ewald, *Die Propheten des Alten Bundes*; Hengstenberg, *Christology of the Old Testament*; Fairbairn, *Prophecy*; Davidson, *Introduction to the Old Testament*; Stanley, *Lectures on the Jewish Church*.

PROPOLIS, a substance used by bees in the construction of their combs, to give to the fabric a strength which it could not have if made of wax alone. See BEE. It is also

* Dean Stanley, *Jewish Church*, vol. i. p. 466.

used for closing up chinks of the hive. It is a resinous unctuous substance of a reddish-brown color, a somewhat bitter taste, and an agreeable aromatic odor, and is collected from the buds of trees. Huber found bees eagerly to appropriate the viscous exudation which abounds on poplar buds. Propolis probably differs a little in chemical composition according to the tree it is obtained from, but it consists chiefly of resin. It is brought to the hive on the legs of bees, and adheres to them so strongly that the assistance of other bees is necessary for its removal. The name is from the Greek *pro*, before, and *polis*, a city; because the most exposed parts of a bee-hive exhibit this substance in greatest abundance. Foreign bodies introduced into a bee-hive, and which the bees are unable to remove, are covered with propolis.

PROPONTIS. See MARMORA, SEA OF, *ante*.

PROPORTION, in arithmetic and geometry, is a particular species of relation subsisting between groups of numbers or quantities. Notwithstanding that the idea of proportion is found to exist in perfection in the mind of every one, yet a good definition of it is a matter of extreme difficulty. The two definitions which, on the whole, are found to be least objectionable are that of Euclid, and the ordinary arithmetical definition. The latter states proportion to be the "equality of ratios," and throws us back on the definition of the term *ratio* (q.v.); which may most simply be considered as the relation of two numbers to each other, shown by a division of the one by the other. Thus, the ratio of 12 to 3, expressed by $\frac{12}{3}$, or 4, denotes that 12 contains 3 four times; and the ratio of 8 to 2 being also 4, we have from our definition a statement that the four numbers, 12, 3, 8 and 2, are in proportion, or, as it is commonly expressed, 12 bears to 3 the same ratio that 8 does to 2, or 12:3::8:2. In the same way, it is shown that 3:8::13 $\frac{1}{2}$:36; for $\frac{3}{8}$ expresses the ratio of the first to the second, and $\frac{13\frac{1}{2}}{36} = \frac{27}{72} = \frac{3}{8}$. It will be gathered from the two arithmetical proportions here given, and from any others that can be formed, that "*the product of the first and last terms (the extremes) is equal to the product of the second and third terms (the means);*" and upon this property of proportional numbers directly depends the arithmetical rule called "proportion," etc. The object of this rule is to find a fourth proportional to three given numbers, i.e., a number to which the third bears the same ratio that the first does to the second, and the number is at once found by multiplying together the second and third terms, and dividing the product by the first. Proportion is illustrated arithmetically by such problems as, "If four yards cost six shillings, what will ten cost?" Here, 15 being the fourth proportional to 4, 6, and 10, fifteen shillings is the answer. The distinction of proportion into *direct* and *inverse* is not only quite unnecessary, but highly mischievous, as it tends to create the idea, that it is possible for more than *one* kind of proportion to subsist. *Continued proportion* indicates a property of every three consecutive or equidistant terms in a "geometrical progression" (q.v.)—for instance, in the series, 2, 4, 8, 16, 32 . . . , 2:4::4:8::8:16, etc., or 2:8::8:32, etc. In the above remarks, all consideration of *incommensurable quantities* (q.v.) has been omitted.—The definition given by Euclid is as follows: Four magnitudes are proportional, when, any equi-multiples whatever being taken of the first and third, and any whatever of the second and fourth, according as the multiple of the first is greater, equal to, or less than that of the second, the multiple of the third is also greater, equal to, or less than that of the fourth—i.e., A, B, C, D are proportionals, when, if mA is greater than nB , mC is greater than nD ; if mA is equal to nB , mC is equal to nD ; if mA is less than nB , mC is less than nD ; m and n being any multiples whatsoever. The apparent cumbrousness and circumlocution in this definition arise from Euclid's endeavor to include incommensurable quantities; throwing them out of account, it is sufficient to say that four magnitudes are proportional, if, like multiples being taken of the first and third, and like of the second and fourth, when the multiple of the first is equal to the multiple of the second, the multiple of the third is equal to the multiple of the fourth. Abundance of illustrations of the general definition will be found in the fifth book of Euclid, and of the particular one in the notes appended to some of the later editions of the same work; it will be sufficient here to give an arithmetical instance of the working of the particular definition. Taking the four numbers of a previous example—12, 3, 8, 2; of 12 and 8 take multiples by 4, and of 3 and 2 by 16, then 12×4 (the multiple of the first) = 3×16 (the multiple of the second), and 8×4 (the multiple of the third) = 2×16 (the multiple of the fourth). In this example, the two multiples were so taken that the multiple of the first would be equal to the multiple of the second, and when it was found that the multiple of the third was also equal to the multiple of the fourth, the proportionality of the four numbers was established.

PROPORTION IN ÆSTHETICS, the relative size and form of the several parts of any object which conveys the most pleasing effect to the eye and satisfies the mind as to its adaptedness to its evident use; also, applicable to groups of associated objects in their harmonious juxtapositions. The effort to find some invariable law of proportion for all objects, like those which are used in the exact sciences, is not likely to succeed, and springs rather from the desire to have a creed in art than a principle. The snowflake crystal is an illustration of perfect proportion and perfect symmetry; but snow

forms an infinitude of utterly dissimilar crystals, so that, were we to endeavor to fix upon the perfect snow-crystal, or the law of proportion in the perfect snow-crystal, we should meet the difficulty that runs through all nature—that the laws will be as numerous as the subjects which they govern. Therefore, each subject is “a law unto itself.” An approximation to a principle of proportion may be made in many things by our experience in comparing the pleasure we receive from one series of proportion rather than another, and the evidence which we have that one proportion is better adapted to its work than another. It is a branch, therefore, of comparative anatomy in which all the things of the universe are to be analytically examined to find the reason for the sensations which they produce in the mind. A German writer, A. Zeising, has assumed a principle of proportion as of universal applicability, viz., that the several parts of objects must be to each other in proportions like a line divided into two parts, of which the shorter shall be to the longer as the longer is to the whole; or, stated in another way, so that the larger part of any body shall be a mean between its smaller part and its entirety. The application is made to the human form, and it is not difficult to fix upon points of division so as to make the parts conform to the rule and seem to show its invariability. The rule may be of value in the arts, but it falls far short of being a general law of beauty of proportion. Observe the wide diversity of tree-forms. We derive lively sensations of beauty from all their diverse variety of proportions. By what stretch of ingenuity can we apply that law to govern their proportions that will not be contradicted by half of those forms which give equal pleasure? A broad-headed low elm full of grace, symmetry, and strength; a palm in the tropics, with a slender tuft of waving leaves near its lofty summit; the young elm of the forest border, tall and picturesque and as unlike its mature type as possible; evergreen trees that sweep the ground with great breadth of pendant branches diminishing to a spiry top; and trees of the same family that rear columnal trunks of immense magnitude to carry a small top,—in all these wide diversities of proportion the mind is impressed equally with the beauty of proportion of each separate type. Our aesthetic perceptions of proportion are intellectual. They exact that the thing which we admire must be proportioned to its use. The broad-branching elm has grace and beauty not derived from the value of its shade, yet we instinctively recognize the merit of its breadth of shade and credit it with better proportions as it fulfills this use. The young elm of the forest border, with its straggling thrifty shoots pushing wildly about as if undetermined what form of tree they were created to make, affording little shade and less symmetry, is nevertheless pleasing by its picturesqueness. “It is out of all proportion” some might say. But, more intelligently viewed, it is animate with the growth peculiar to its youth. The student and lover of trees finds it a charming specimen; a perfectly proportioned young elm,—much as a physician speaks of a child at birth as a perfectly proportioned child, though the proportions would be hideous if maintained to maturity. The statue of Hercules in the garden of the Tuileries is a marvelously well-proportioned, but abnormal development of the muscular system; but it is a monstrosity if made to represent a normal man. Take, for instance, the figure of a dancing-girl with the vigor of life and action rendered by modern sculptors. The combination of grace, muscular force, and mental nerve exhibited are such that any ordinary observer will be struck with its beauty of proportion, its supreme life-fullness. But what is the instinct in the unreasoning man which tells him, at a glance, that that work is perfect in its proportion? It is that there is concentrated in one figure before him all the possibilities of beauty and power and activity which he has seen now and then around him all his life, but not in one form before. Let a savage stand before a statue of a muscular Hercules and he will be at once and powerfully impressed with its perfection, and would be very likely to worship it as a god. But place him before a spiritual conception in sculpture of some high moral attribute only, and he will show little sense of its beauty of proportion. Thus, proportion is not a fixed rule of form, but an impression on the mind according to the quality of the mind itself, and to the objects whose impression the mind has been educated to take. The machinist who studies the mechanism of pumps will see beauties of proportion in the parts of a machine that the sewing-machine man could not see, and *vice versa*. Outside of our own kind no animal interests so much by its beauty and proportions as the horse. Ask a London dray-man to select the most finely proportioned horse, and he will in all probability select for his model a dray horse. Ask the hunter to do the same, it will be the finest hunting-horse; the turfman, a racer; and the highland boy will choose a shaggy pony. This again shows that our education molds the rule of proportion in every case.

Architecture ought to be more the subject of rule in proportion than any other fine art. Its lines are all geometrical. Its constructions conform to geometric and mechanical laws of the most truly scientific character. But when we come to its effects on the eye we find that, as in nature, each construction is a rule unto itself. The Greek temple that men accepted as unique perfections in architecture an hundred years ago, and sought to crown with the attribute of perfect proportions, are perfect, as every well-grown tree of its species is perfect, without proving that every other species of tree has not equally perfect specimens of widely different proportions. The Gothic architecture, about which fanciful and absurd theories have been advanced as to its being suggested by the interweaving branches of avenues of trees whose trunks were the columns and

their branches the arching ribs that formed the models, in reality grew by the commonest clumsy processes of elimination by mechanics of the weaker and more expensive Roman arch by the arch suggested by the crossing of two circles. The novelty alone of the new form would give it an active growth. Its strength and capabilities were discovered afterward, and the beauties of proportion found in the great works of its perfecting era are utterly discordant in their variety. Compare, for instance, the façade of Westminster abbey and Notre Dame of Paris. Both main façades have towers on a similar plan. But the latter is noble to a degree that is wanting in the former. Both are good Gothic. Both are pleasing. The Notre Dame façade has level lines crossing its front with a boldness that is peculiar to it. In theory they might have spoiled the unity of the style: in fact, they add to its expression. But to such great works, there ought, we may suppose, to be some definite law of proportion between the parts—between the length, the breadth, and the height; between the towers and spires and the main body. But we find cathedrals where the church part is subsidiary to the towers—hid behind the façade as in the cathedrals of Ulm and Amiens, in France, and the effect is superb; we would not have them differently proportioned. Again, the towers are subsidiary, till the mass loses boldness of expression. But who can define where change in proportion shall cease to vary? The new parliament house in England is a remarkable example of bold and lofty towers breaking up from long level palace lines. By what rule could the student for "a law of proportion" govern the relation of these parts? Frequently, the wider the divergence from some supposed law of harmonious proportion, the more pleasing the result. This does not prove that there can be no law of proportion, but only that the law is an endless book, the preface to which is made by the experiments of the past, and the body of the volume yet to be made by experimenting and comparing effects, to the end of time, to develop all the laws of proportion that the universe illustrates.

The words symmetry and proportion are often used as interchangeable terms. A difference in aesthetics is this: that while symmetry suggests the balance of similar parts, good proportion alone may not be violated by the association of parts not similar. A building, for instance, may have a center with two wings balancing each other as to size and form, so that the whole is a well-proportioned edifice. But if one of the wings have Gothic windows, the other Roman, and the center Greek, it would certainly be an unsymmetrical building. The absence of proportion and symmetry often produces picturesqueness—as of a tree bent and growing to one side; but the three qualities may all be united in one object, as in a tree with very bold irregularity of branches and outline, yet as a whole well balanced on its trunk, and symmetric because of the general similarity of its growth on all sides. The parliament houses in London furnish an architectural example wanting in the United States of the union of proportion, symmetry, and picturesqueness.

PROPORTIONATE REPRESENTATION. See REPRESENTATION, in politics.

PROPOSITION. This is the technical name for the final constituent or ultimate element of whatever we call knowledge—what we can believe or disbelieve. "Fire melts wax;" "the harvest is good;" "Rome stands on the Tiber;" "the moon is not inhabited"—are propositions. All information, whether historical, scientific, or practical, may be resolved at last into simple statements such as these; and all such statements are propositions. In every proposition there are two parts: something spoken about, called the subject; and something said, affirmed, or declared of what is spoken about, called the predicate. In the first example given "fire" is the subject, "melts wax" is the predicate or affirming part, to which a verb is necessary. In the second example "harvest" is the subject, "is good" the predicate. But sometimes this last part is resolved further into predicate (good) and copula (is). The predicate then simply means the quality or fact affirmed, while the copula gives the affirmation. In the previous case the copula is contained in the predicate (melts).

Propositions are *affirmative* or *negative*, according as we declare that a thing is, or that it is not; "the moon is (not) inhabited." As some propositions contain the form of a condition, and some the form of an alternative, these are called *hypothetical*, in opposition to which the rest are called *categorical*. If A is B, C is D, is the *conditional* form of the hypothetical class. Either A is B, or C is D, is called the *disjunctive* form.

Propositions are further divided, according to their quantity, or according to the extent of the subject, into *universal*, *particular*, *singular*, and *indefinite*: "all the moving powers are originally derived from the sun" (universal); "some men are wise" (particular); "Socrates is wise" (singular). The "indefinite" means the uncertain or ambiguous in form, as "wine is good;" many of this form are known to be universal, as "man is mortal."

In inquiring into the ultimate import or meaning of propositions, Mr. John Stuart Mill came to the conclusion that they fall under five classes, distinguished according to the nature of the quality predicated. The five universal and comprehensive predicates are—existence, co-existence (sometimes taking the form of order in place), succession (order in time), causation, resemblance. Every fact, or piece of information consists in the affirmation of some one of these five general attributes. Existence by itself expresses a very limited class, since we usually specify circumstances of time, place, etc., in the

same assertion: "There is an ether for conveying light and heat," is a proposition of existence; but it would be more usually stated as having locality (order in place, or co-existence), "an ethereal medium is diffused over all space." Existence is the only one of the five attributes that can be affirmed of one thing; all the rest require at least two things. The attribute of co-existence appears in a very large number of propositions; all geographical statements and local descriptions; all the natural conjunctions of properties (the animal frame consists of digestive organs, a nervous system, etc.), affirm co-existence. The attribute of succession is seen in history, and in all the changing aspects of things. The attribute of causation is a special case of succession, so important as to be raised to the rank of a first-class predicate. The facts of physical and mental science involve not merely succession, but cause and effect: "Heat expands bodies;" "practice improves the human faculties." The concluding attribute—resemblance—is of very wide occurrence. The propositions of numerical or mathematical science all involve some assertion of equality or inequality, proportion or disproportion: "Twice three is (equal to) six;" "triangles in the same base and between the same parallels are equal." Throughout all our knowledge, the affirmation of likeness, or of unlikeness, is a fundamental fact; but in mathematics it constitutes the characteristic predicate, or the sole affirmation.

PROROGATION, the continuance of parliament from one session to another. Parliament is prorogued by her majesty's command, signified in her presence by the lord chancellor, or speaker of the house of lords, to both houses, or when her majesty is not personally present, by writ under the great seal, or by commission. Prorogation not only suspends all business, but quashes all proceedings pending at the time, except impeachments by the commons and writs of error and appeals before the house of lords. A bill must be renewed after a prorogation, as if it had never been introduced. A prorogation for a single day has sometimes been resorted to to enable a bill to be brought in a second time, it being a rule that no second bill of the same substance with a prior one, can be introduced in the same session. Thus parliament was prorogued by William III. from Oct. 21 to 23, 1689, in order to renew the bill of rights, regarding which a difference had arisen between the upper and lower house that was fatal to it. By 37 Geo. III. c. 127, after parliament had been prorogued to a particular day, her majesty may, by proclamation, call it together on any other day, not less than 14 days distant, to which day parliament then stands prorogued. See PARLIAMENT.

PROSECUTION, though often used in a general sense, as applicable to all kinds of litigation, is also used technically to denote the institution of criminal proceedings against a party. There are two ways in which a prosecution commences in England. One is to summon, or, in the graver cases, to arrest and bring the offender before a justice of the peace, when the witnesses are examined, and if the justice thinks a *prima facie* case is made out, he commits the offender for trial. Another way is without any such preliminary inquiry before a justice, for the prosecutor to go with witnesses before a grand jury, and in all cases this is a step in the prosecution. The grand jury hear the witnesses, and if they think there is a *prima facie* case, they find a true bill; if otherwise, they ignore the bill. The bill means an indictment. When the indictment is found, the prisoners are arraigned at the bar, and asked by the judge whether they plead guilty or not guilty; and in general they plead not guilty. A jury of twelve men are then sworn, and try the case, and find a verdict of guilty or not guilty; if the former the judge sentences the prisoner to punishment, which varies according to the enormity of the offense. In general, a new trial cannot be held in criminal cases, though, if an error is committed, the conviction is often quashed.

PROSECUTOR is the person who takes the initiative in punishing crimes. In England there is no public prosecutor, and the prosecution of crimes is left to the spontaneous action of the injured party. Hence it often happens that many crimes go unpunished, for the mere want of its being anybody's business to attend to this part of the public interest. It is true that the attorney-general is sometimes the prosecutor on behalf of the public; but this only happens in rare and exceptional cases connected with political government or some monstrous and abnormal crime. In all cases, therefore, it may be accurately stated that it is left to the uncontrolled discretion of anybody to commence a prosecution, however great a stranger to the circumstances. But though he may take the initiative, yet in the ordinary course, a stranger seldom undertakes such a duty, and for very sufficient reasons. If a party is robbed by a servant or clerk, or by burglars, he naturally desires to prosecute them; if a person is murdered, some one of the relatives naturally prosecutes. Therefore, there is in most cases a sufficient motive impelling some party, or friend of the party injured by the crime, out of mere revenge, if for no other reason, to commence a prosecution. But it follows that, as there is no public prosecutor, and as he who acts as such is a volunteer, he does so more or less at his own expense, and in the first instance must always do so. He must employ his own attorney and counsel, who, of course, require to be paid for their services. It is true that the expenses of prosecuting most crimes are supposed to be ultimately repaid by the county in which the trial takes place; but this allowance is a wretched pittance, and is seldom one-fourth of the real expenses incurred by the private prosecutor. Hence, in the end, the prosecutor finds that he loses a great deal of money as well as time in carrying on a prosecution. Indeed,

in practice, the result is, that no person to whom his money is of much consequence ever prosecutes a second time, and the first time he almost invariably does so in ignorance of the pecuniary result, there being a vague kind of popular belief that the expenses are repaid. Few people, indeed, fail to repent of embarking in such a litigation; and the prudent and experienced are in the habit of remarking, that prosecutions are only kept going by the unbroken succession of young and inexperienced persons who do not know better. A person who prosecutes a small larceny of five shillings may incur expenses of from five to fifteen pounds, which is money out of pocket when his attorney's bill is paid. But not only is there great expense and loss in the mere prosecution itself; there are far more grievous consequences. If it happen—and it seems in about half of the cases it really does happen—that the prisoner is not found guilty, or the case breaks down from defective evidence or otherwise, the first thing that the prisoner does is to bring an action for false imprisonment, or for malicious prosecution, against the prosecutor. It is said that attorneys infest all the police courts and petty sessions, by keeping an organized service of watchers to pick up cases of this kind, which are called speculative actions. The speculative attorney promises to take the chance of gaining the action, and, of course, as it costs the prisoner nothing, he readily lends his name, and, out of revenge, joins keenly in the attempt to recover large damages. It is true that in all such cases the prosecutor ought not in theory to lose the verdict, if he acted under a reasonable and honest belief that a crime had been committed; but, however plausible this defense may be in theory, it is a very different thing to establish it in practice. At the trial of the action, counsel on such occasions enlarge on the monstrous oppression of having given an innocent man into custody, blasting his character and reputation for life, and attributing the prosecution to spite or malice; and as the presumption is always in favor of innocence, it is astonishing how easily a jury may be led away by a spurious sympathy in favor of the quondam prisoner. It is thus entirely a lottery in such cases how the verdict will go, and verdicts of ten, fifty, or a hundred pounds of damages are often obtained, simply because of the accidental defect of some conclusive piece of evidence, with which the defendant in the action had probably no more to do than any other person. When the quondam prosecutor is a person of substance and position—and, of course, a speculative attorney will not sue those who are not so—he often finds it prudent to compromise the action by paying a lump sum, rather than run the risk of a trial. Many attorneys in the metropolis and large towns of England carry on a large and lucrative business by systematically bringing these speculative actions against unsuccessful prosecutors. The evils of this state of the law have been often complained of, but have not yet been remedied, probably because other systems of prosecuting crime are open to objections.—In Scotland, a well-settled system of public prosecutors has long been in operation, which avoids most of the evils already described. The lord-advocate is *ex officio* the public prosecutor, and there are counsel called advocates-depute who assist him, besides a local functionary called a procurator-fiscal (q.v.) in all parts of the country. The public prosecutor's duty and business is to act on all reasonable suggestions that a crime has been committed, but he is not compelled to prosecute. If he refuse to do so, a private party may at his own risk, with the concurrence of the lord-advocate, insist on the prosecution; but he may be called on to find caution or give security. The usual course is for the procurator-fiscal to take the recognitions; i.e., the examination of witnesses before the sheriff, a copy of which is laid before the crown-counsel, and if they are satisfied that a *prima facie* case is made out, the proceeding is carried on to trial; but if there is not sufficient evidence, the prisoner is ordered to be at once discharged. The entire expense of prosecuting crime in Scotland, whether at the higher or local tribunals, is borne by the public; the persons specially injured having nothing whatever to do in the matter except to appear as witnesses when called upon. This system has worked for three centuries with entire satisfaction.

PROSECUTOR (*ante*), in the United States is a public officer appointed by the general government or by that of each state to institute criminal proceedings against the violators of U. S. or state laws. It will be seen from this definition that the English system of prosecution by private individuals is not followed in this country, though in some states there may be private as well as public prosecution. The U. S. prosecutor is termed a district-attorney, and one is appointed by the president for each judicial district; in the state similar officers for each district or county are provided, usually by appointment from the legislature or the executive power, but sometimes by election. Prosecuting officers are also appointed for the police and minor courts, with less power than that of the district-attorneys, and special prosecuting agents are often provided to carry out laws regarding the licensing of liquor dealers. It is the duty of the public prosecutor in cases of small magnitude, or where the system of "informations" alone prevails, to present to the court a written accusation against the accused person, which must be under oath, and is called the information. In cases where a grand-jury indictment is necessary, he must frame the document and lay it before that body, with evidence in support of the allegations therein contained. He has the right to be present at the sessions of the grand jury, and to give their investigations all possible aid. When a "true bill" is returned by the jury the further conduct of the prosecution is altogether under his control. He may employ private counsel to assist him, or allow others to do

so, but he remains the responsible instrument of the law. He may, if the evidence or facts within his knowledge justify in his judgment the step, enter a *nolle prosequi*, thus ending the present prosecution, but not barring the right to begin a new action on the obtaining of further proof. In some states the consent of the court must be obtained to the entering of a *nolle*, but it is usually within the discretion of the public prosecutor. The accused has a right to refuse the offer and demand a verdict, if a jury have been impaneled.

PROSELYTES (Gr. *pros-elytos*, one who comes from without, a stranger; Heb. *Gerim*) was the name given by the Jews to those heathens who became converts to Judaism. There were two kinds of proselytes distinguished: "proselytes of the gate," that is, heathen strangers, who, in order to be allowed to reside in Palestine, had undertaken to submit to the "seven commandments of the sons of Noah," that prohibit blasphemy, idolatry, murder, incest, theft, disobedience to the authorities, and the eating of flesh with the blood in it; commandments which probably had grown out of certain restrictions originally put upon the "strangers" by the Mosaic law (Exodus xii. 19; xx. 10, etc.). These "proselytes of the gate," "or sojourners," could not claim all the privileges of an Israelite, could not redeem their first-born, and, at a later period, were not allowed to live in Jerusalem; yet they were permitted to offer whole burnt-offerings, and otherwise contribute toward the religious wants of the commonwealth. The second class of proselytes was formed by the *gere hatsedek* (pious proselytes, or *gere haberith* (proselytes of the covenant). These accepted all the dogmas and customs of Judaism to their fullest extent, and were called "complete Israelites." The new candidates were first strictly asked for their motives, and the classification of those who were not to be admitted runs as follows: those whose motive is love (husband for the sake of following his wife's faith, or *vice versa*); proselytes of the tables of the kings (i. e., those who covet court-favor); Esther-proselytes (who wish to escape some threatening danger, cf. Esther, viii. 7); and Lyon-proselytes (those who, from a superstitious fear, wish to enter Judaism, like the Samaritans, 2d Kings, xvii. 26). If, on the other hand, the motives were satisfactory, the candidate was further cautioned against attaching himself to a persecuted people, and warned that sufferings of all kinds would be his lot in this life. If all this did not deter him, he was "brought under the wings of God." He was fully instructed in the religion and history of the people, and shown the special providence that guided them and watched over them. If a male, he was circumcised, and, in case of his being circumcised already (for instance, if he belonged to another nation practicing this rite), a few drops of blood were drawn "from the blood of the covenant," a special prayer was said for him, and a new name was given to him, while for that of his father, Abraham was substituted. After the healing of the wound, baptism (*tebillah*) followed, and he had further to offer up a sacrifice (*korban*). Females had likewise to undergo baptism and to bring a sacrifice. All natural relations were then canceled, the proselyte was considered like "a new-born child," and the Holy Ghost was supposed to come upon him.

The desire to proselytize, which became strong among the political leaders during the Maccabean period, and which led to the "bringing into the congregation" of entire nations, such as the Idumæans under John Hyrcan, the Ituræans under Aristobulos, contrasted strongly and most characteristically with the utter contempt in which the new-comers were held by the people, and with the suspicion with which they were regarded, and their (after all) limited social rights and ambiguous position. The Talmud speaks of them in no measured terms, and there is no doubt that, on the whole, they must have acted a very dubious part. They were called the leprosy of Israel; it was the proselytes and other reprobates who stood in the way of the coming of the Messiah; and up to the twenty-fourth generation were they to be distrusted. Yet, notwithstanding all this, conversions were very frequent, especially among the better classes—and here, again, among women principally—in Damascus, Greece, Asia Minor, Rome; so much so, that even the Roman legislation was compelled, in the 1st c. B. C., to provide for cases of Judaizers. It is a curious fact, worth remembering, that one of the main features of the times of the Messiah was to be, according to Jewish tradition, the utter abolition of proselytism, and the entire ceasing of all distinctions of an opprobrious nature among men. The evil repute into which the term proselyte had fallen in the times of Christ also caused the early converts to Christianity to adopt the name of Neophytes (newly-baptized) instead.

PROSERPINA, the Latin form of the Greek PERSEPHONE (also PERSEPHATTA, PERSEPHASSA, PHEREPHASSA; in Homer, PERSEPHONEIA), was, according to the common myth, the daughter of Zeus and Demeter (Ceres) or of Styx. The story of her abduction by "gloomy Dis," while gathering flowers on the plains of Enna, in Sicily, in company with Artemis and Athena, does not occur in Homer, who simply represents her as the wife of the king of Hades, and as the majestic queen of the under world—a subterranean Hera (Juno). It is first given by Hesiod, and is manifestly an allegory of the seasons. See CERES. In the mystical Orphic hymns, Proserpina appears as the all-pervading goddess of nature, who produces and destroys everything, and she has been mixed up and identified with other mystical goddesses, Rhea, Artemis, Hecate, etc. She was generally worshiped under the name of *Kore*, "maiden," along with her mother

Demeter. The chief seats of her worship were Sicily and Magna Græcia; but she had also temples at Corinth, Megara, Thebes, and Sparta. In works of art, Proserpina is represented sometimes as the grave and earnest spouse of Pluto, sitting on a throne beside her somber husband, with a scepter and a little box; but more frequently as a blooming virgin, the picture of her mother, in the act of being carried off to Hades.

PROSODY (Gr. *prosōidia*, literally, "belonging to song or hymn") is the name given, both by the ancients and moderns, to that part of grammar which treats of the rules of rhythm in metrical composition. See **METER**, **RHYME**, **BLANK VERSE**.

PROSPECT, in Roman law, was recognized as a legal incident of a house, or an urban servitude, so that no adjoining owner was entitled to obstruct the prospect or view of a man's house. But if this meant more than that the light should not be sensibly obstructed, it is not recognized in English or Scotch law. See **LIGHT**.

PROSSNITZ, a manufacturing t. of Austria, in Moravia, in the fruitful plain of Hanna, stands on the Rumza, 12 m. s.w. of Olmütz. It has manufactories of woolen cloth, cashmeres, linen and cotton stuifs, distilleries, and breweries. Pop. 15,717.

PROSTATE GLAND, a pale, firm, glandular body situated in the lower part of the pelvic cavity, surrounding the neck of the bladder and the commencement of the male urethra. In shape and size it resembles a horse-chestnut, weighing about six drams, and is held in position by the anterior ligaments of the bladder, deep perineal fascia, and anterior portion of the levator ani muscle. It consists of three lobes, one middle and two lateral, and is inclosed in a thin but firm fibrous capsule, distinct from that of the posterior layer of deep perineal fascia, and separated from it by a plexus of veins. Its interior is of a pale, reddish-gray color, easily torn, but very dense, consisting of glandular substance and muscular tissue. The glandular substance is composed of numerous follicles opening into elongated canals, which join to form from 12 to 20 small excretory ducts which open into the urethra. The epithelium (q. v.) lining the canals is columnar, while in the follicles it is squamous. The muscular tissue (of the involuntary kind) is in the form of circular bands round the urethra, and is continuous behind with the circular fibers of the sphincter of the bladder, and in front with the circular fibers of the urethra. The prostate gland secretes a milky fluid having an acid reaction, and, when examined with the microscope, showing squamous and columnar epithelium and granular nuclei. In old age it is liable to become enlarged, and it is also sometimes the seat of various diseases. Inflammation of the organ is rarely ideopathic, but not infrequently occurs as the result of gonorrhœa, or the use of instruments. Abscess may happen either as the result of acute inflammation, or it may occur with comparatively little antecedent inflammation, as sometimes happens in pyæmia. Prostatitis is liable to produce retention of urine, either from inflammatory exudation, or from the pressure caused by the formation of pus. In such cases the urine must be drawn from the bladder by a catheter, an operation which, under the circumstances, requires considerable skill and knowledge in order to avoid injuring the gland. The enlargement spoken of above as occurring in elderly and aged persons, although liable to affect all classes, is more usual in those who have led irregular lives. The enlargement is due to hypertrophy of the normal structures, fibrous and glandular, of the organ, most commonly of the fibrous, but often of all the tissues. In rare cases there is excessive development of the glandular element, and sometimes tumors are developed. Sometimes the gland attains large dimensions. A preparation of one taken from a man eighty years old, in the Norwich hospital museum, England, weighs 20 ounces. The physical effects of enlarged prostate are often very distressing, but the moral effects are sometimes even worse, the constant irritation exciting libidinous ideas, leading to the perpetration of acts of indecency in those who have not firm moral control. It is not infrequently, however, the case that wrong ideas and wrong habits have preceded the prostatic disease and have been the cause of it. A state of atrophy sometimes occurs in the prostate gland as the result of exhausting disease; in some cases it may be congenital. The gland may also, very rarely, be the seat of cancer, as well as of tubercle, and of cystis, and prostatic calculi. Prostatic calculus generally occurs in old people, though it is sometimes met with in young subjects. Erichsen extracted two prostatic concretions from a lad of nineteen. These calculi are usually of a gray color, of a somewhat triangular form, hard, smooth, and polished, about the size of a cherry-stone or smaller, and have facets. Sometimes they attain the size of a hen's egg, when they are usually much branched and irregular.

PROSTITUTES, LAW AS TO. It is not an offense in this country for a person to carry on a course of prostitution in his or her own person; but when others are incited, or forced to that course, it may become so, in certain circumstances. Thus, for a person to keep a disorderly house, is an indictable offense, which is punishable by fine and imprisonment, and the parish officers in England are bound to institute the prosecution, the expenses of which are paid out of the poor-rates. It is, however, only the person who keeps the house who is punishable, and no punishment can be imposed on the frequenters of the house in any circumstances. The law may be said to be passive so far as the mere fact of prostitution or immoral intercourse is concerned, and gives neither party any remedy against the other, civil or criminal, arising out of that state of the

relations between man and woman. Thus, if a man give a woman a bond, providing her an annuity in consideration of her living with him in concubinage, the law will not enforce it, because it is an immoral consideration. So, if a woman take lodgings, or buy dresses, for the purpose of carrying on a course of prostitution, the law will not enforce the payment of rent, or the price of the goods sold, because the tendency is immoral. In some countries, as in France, the law takes direct cognizance of the fact of prostitution, and deals with prostitutes for various sanitary purposes; but in this country the subject was entirely ignored, except indirectly in the cases above mentioned, and until 1864, when a statute was passed, which, to a certain extent, introduced the French procedure. The statute 27 and 28 Vict. c. 85, applied only to certain naval and military stations—viz., Portsmouth, Plymouth, Woolwich, Chatham, Sheerness, Aldershot, Colchester, Shorncliff, the Curragh, Cork, and Queenstown, but not to Scotland. In those places a justice of the peace may now, on information, order a woman to be taken to a certified hospital for medical examination; and if she is found to have a contagious disease, she may be detained in the hospital for medical treatment during not more than three months. A woman who refuses to submit to examination, or leaves the hospital without being duly discharged, is liable to be imprisoned for one or two months; and occupiers of houses alluring prostitutes to frequent their houses when having a contagious disease, incur a penalty of £10, or three months' imprisonment.

PROSTYLE. A temple with a portico in front. When it had a portico at both ends, it was termed amphiprostyle.

PROTAGORAS, the Greek sophist, was a native of Abdera, where he was born of humble parentage, probably about 480 B.C. He was the first who took the name of "Sophist," or taught for pay. When he went to Athens is not precisely known; but he is conjectured to have gone thither about the middle of the century, and he seems to have enjoyed the friendship of Perikles. Accused of atheism by one of his own scholars he was banished from Athens, and his writings were ordered to be publicly burned. He died probably in 411 B.C. The basis of his speculation is the proposition that "man is the measure of all things," which was developed by him in a way that involved the most thorough-going skepticism. The *Theatetus* and *Protagoras* of Plato are devoted to a refutation of Protagoras's doctrines, which, as delineated by the great philosopher, appear shallow, confused, and untenable. All Protagoras's works are lost, though some were extant as late as the time of Porphyry.

PROTEACEÆ, a natural order of exogenous plants, containing about 650 known species of shrubs and small trees, chiefly natives of South Africa and of Australia, and forming a remarkable feature of the vegetation of these regions. Some of them, as species of *protea* and *banksia* (q.v.), are frequently cultivated in gardens and green-houses, being prized for their singular and elegant appearance, and their curious and often beautiful flowers. They have usually umbellate branches; their leaves are evergreen, and remarkably hard, dry, and woody, divided or undivided, and without stipules. The perianth is four-leaved or four-cleft; the stamens, four, one of them sometimes sterile, perigynous, opposite to the segments of the perianth; the ovary superior, consisting of a single carpel; with one, two, or many ovules; the style simple, the stigma undivided; the fruit dry or succulent, and opening or not opening, many fruits often collected in a kind of cone. The timber of some of the larger species is used for various purposes; others supply much of the firewood of the cape of Good Hope and Australia. The nuts or seeds of some are eaten, as those of *brabejum stellatum* in South Africa, and of *gvevina acellana* (also called *quadria heterophylla*) in Chili. Those of the latter are much esteemed, and are called *acellans* and *ncbu*.

PROTECTION—PROTECTIVE DUTY, in political economy, terms applied to a practice, now in disuse in Britain, of discouraging, by heavy duties and otherwise, the importation of foreign goods, under the notion that such a practice increased the prosperity of the country at large. See **FREE TRADE** (*ante*); **TARIFF**.

PROTECTOR, a title which has sometimes been conferred in England on the person who had the care of the kingdom during the sovereign's minority. The earl of Pembroke was protector in 1216, in the minority of Henry III. Humphry, duke of Gloucester, held the same office in the minority of Henry VI., from 1422 to 1447. Richard, duke of Gloucester, was protector in 1483, prior to his ascending the throne as Richard III. The duke of Somerset, one of king Henry VIII.'s sixteen executors, was in 1548 constituted protector, during the minority of Edward VI., with the assistance of a council, consisting of the remaining fifteen executors; a dignity, however, which he enjoyed but a few months. Oliver Cromwell, in Dec., 1653, took the title of lord protector of the commonwealth of England, Scotland, and Ireland. In 1658 his son Richard succeeded to his title and authority, but was never formally installed in the protectorate, which he resigned in the following year.

PROTEIDS (**PROTEINE** and **PROTEINE BODIES**, *ante*). The proteine bodies may be included under the general name of *proteids*, and divided into the following classes:

CLASS I. *Native albumens*, occurring, as their name implies, in a natural state in animal tissues and fluids. They are soluble in water, and are not precipitated by very dilute

acids, by carbonates of the alkalis, or by chloride of sodium. They are coagulated when heated to about 158° Fahr.

1. *Egg-albumen*.—This naturally exists in an aqueous solution, forming a transparent yellowish fluid, from which it may be precipitated by strong alcohol. If the alcohol is immediately and rapidly removed the precipitated albumen will readily redissolve in water. If the alcohol is allowed to remain, the precipitate forms a coagulum which is insoluble. Ether coagulates egg-albumen. Strong acids, especially nitric, produce coagulation like that by heat or the prolonged action of alcohol, and the coagulum does not redissolve on the removal of the acid. Nitrate of silver, acetate of lead, and corrosive sublimate, cause precipitation without coagulation, but the precipitate will redissolve if the precipitant is removed. Strong acetic acid in excess produces no precipitate; but if the solution is concentrated the albumen is transformed into a transparent jelly, and a similar result follows the addition of strong caustic potash, a profound change being effected in both cases. A solution of egg-albumen turns the plane of polarization of yellow light 35.5° to the left (−35.5). Strongly acidifying the solution with hydrochloric acid increases the left-handed polarization to −37.7°.

2. *Serum-albumen* resembles egg-albumen, but is distinguished by the following characteristics: The rotatory power of serum-albumen is for yellow light −56°, and it is not coagulated by ether; nor is it very readily precipitated by strong hydrochloric acid; and whatever precipitate occurs is easily redissolved by the addition of more acid, the reverse of what takes place with egg-albumen. Precipitated or coagulated serum-albumen is soluble in strong nitric acid, which coagulates egg-albumen. Serum-albumen is found in blood serum, and also in lymph, both that which is contained in the lymphatic vessels and in the tissues, also in milk, chyle, and several pathological transudations, one of which may be mentioned, viz., the albumen which appears in urine in certain forms of renal disease.

CLASS II. *Derived albumens* (albuminates).

1. *Acid-albumen*.—If a solution of native albumen is acted on for a time with dilute hydrochloric acid (or some other) it becomes changed in properties; it is no longer coagulable by heat; when the solution is carefully neutralized the albumen is completely precipitated. The proteid in this case becomes converted into what is called *acid-albumen*, whose characteristics are insolubility in distilled water and in solutions of common salt and other neutral salines, but readily soluble in dilute acids as well as alkalis; and such solutions are not coagulable by boiling. If finely-chopped muscle, from which the soluble albumens have been removed, is treated for a considerable time with a .2 per cent solution of hydrochloric acid, most of the muscle becomes dissolved, the transparent solution containing a proteid which closely agrees in most characteristics with acid-albumen, and is called *syntonin* (q.v.).

2. *Alkali-albumen*.—If serum, or egg albumen, is treated with a dilute alkali, a change similar to that which occurred with treatment by acid takes place, and the albumen is no longer coagulable by heat, and precipitation follows neutralization. Indeed, the two preparations seem to be of the same nature, and one may be substituted for the other in subsequent experiments. The rotatory power of alkali-albumen varies according to its source. When it is prepared by strong caustic potash from serum-albumen, the rotation increases from −56° (that of simple serum-albumen) to −86°. When prepared from egg-albumen it is −47° instead of −35.5° (that of simple egg-albumen). If prepared from coagulated white of egg the plane of polarization will be turned −58.8°. It is therefore supposed that there are several forms of alkali-albumen.

3. *Caseine*.—This proteid exists in milk. See CASEINE.

CLASS III. *Globulins*. See GLOBULINE, or GLOBULIN and GLOBULINS.

CLASS IV. *Fibrine* (q.v.).

CLASS V. *Coagulated proteids*.—Insoluble in water, dilute acids and alkalis, and in neutral saline solutions of all strengths; soluble only in strong acids and strong alkalis, except at high temperatures, when dilute preparations will effect a slight solution. The *coagulated proteids* are produced by heating to 158° Fahr. solutions of egg-albumen or serum-albumen, or acid or alkali-albumens, or fibrine suspended in water. At the temperature of the body they are converted by the action of the gastric juice, or of pancreatic juice in an alkaline medium, into peptones. This action takes place during the digestion of cooked meats.

CLASS VI. *Peptones*.—These remarkable organic compounds are very soluble in water, and are not precipitated from their aqueous solutions by acids or alkalis or by boiling. They are insoluble in alcohol, but are also with difficulty precipitated by it, and when precipitated are unchanged by the process. They are not precipitated by sulphate of copper, chloride of iron, nor (with some exceptions) by ferro-cyanide of potassium or acetic acid. In these respects they differ from most other proteids. Precipitation is, however, produced by chlorine, iodine, corrosive sublimate, nitrate of mercury, nitrate of silver, acetate of lead, and tannin. Like all proteids, the peptones have a specific left-hand rotatory power over polarized light; but unlike the others, boiling produces no change in the amount of rotation. Peptones are, doubtless, formed in large quantities in the stomach and intestines during digestion; but only a small quantity can be found in the digesting mass or in the chyle. Without attempting to settle the question as to where the final conversion of proteids into peptones takes place (perhaps upon the sur-

face of the mucous membrane of the stomach, which is probable), it may be remarked that it is generally conceded that the peptones are absorbed very soon after they are formed. See DIGESTION.

PROTEINE AND THE PROTEINE BODIES. Under the term *proteine bodies*, chemists include the following substances: Albumen, fibrine, syntonine or muscle-fibrine, caseine, globuline, and haemato-crystalline. Albumen, fibrine, and caseine are common both to the animal and vegetable kingdom; while the three others occur only in the animal kingdom (namely, in muscular tissue, in the crystalline lens of the eye, and in the blood-cells). The most careful analyses have shown that in their composition, these substances are almost identical, and that they all contain about 53.6 per cent of carbon, 7.1 of hydrogen, 15.6 of nitrogen, and 22.1 of oxygen, with a varying quantity of sulphur not exceeding 1.6 per cent. These substances are as similar in many of their properties, and in the products of their decomposition, as in their ultimate composition, and hence chemists were naturally led to entertain the view that they possessed a common radical. Mulder (q.v.) announced, in 1838, that he had discovered this radical, which, from its importance, he named **PROTEINE** (Gr. *proteus*, I hold the first place), and that he had found that albumen, fibrine, caseine, etc. (which at that period were known as the *albuminous bodies*, the *albuminoid group*, or the *albuminates*), were combinations of this proteine with sulphur and phosphorus, or simply with sulphur. The composition of this proteine is represented, according to the discoverer, by the formula $C_{26}H_{25}N_4O_{10}.2H_2O$. Liebig and several of his pupils have, however, shown that Mulder's proteine always contains a small but variable amount of sulphur; and they deny, on what are generally deemed sufficient grounds, the existence of proteine as a separate body. The term *proteine bodies*, or *proteine compounds*, is, however, commonly retained both by physiologists and chemists, as being the most convenient one for representing a class of compounds, which, whether Mulder's theory is correct or not, deserve their name from their constituting the group which form the most essential articles of food.

The **PROTEINE BODIES** may be generally described as nearly colorless, neutral, nitrogenous bodies, soluble in potash solution, and not yielding gelatine when boiled with water. They all present two modifications, differing essentially from one another; in one of which they are soluble, and in the other nearly or quite insoluble. They exist naturally only in the soluble modification, although not necessarily in a state of solution. Most of them are transformed into the insoluble state by boiling, by the mineral acids, and by numerous salts; and one of them, fibrine, undergoes this modification on simple removal of the blood, or other fluid containing it, from the organism. This passage from the soluble into the insoluble form, is termed *coagulation*, but we do not know what chemical change takes place in the process.

The *soluble proteine bodies*, in their dried state, form pale yellow, translucent masses, devoid of smell and taste, which are soluble in water, but insoluble in alcohol and ether. They are precipitated from their watery solutions by alcohol, by the mineral acids, by tannic acid, but not by the vegetable acids generally; and by many mineral oxides and salts. The *insoluble proteine bodies*, when freshly precipitated, are of a white color, in flakes or small clots, or viscid and glue-like: when dried, they may be reduced to a whitish powder.

The products of the decomposition of the proteine bodies are very numerous, and the study of those products is of great importance, as tending to elucidate the changes which the tissues undergo in the body during their disintegration.

PROTELIÐÆ. See AARD-WOLF.

PROTESILA'US, a legendary king of Thessaly, brother of Alcimedæ, who was the mother of Jason. Protesilaus married Laodamia and soon after sailed with the other Greeks to the Trojan war. Homer portrays him as the first to set foot on the hostile shore and as the first man killed by the enemy. Laodamia committed suicide on hearing of her husband's death.

PROTEST is in law a legal document, drawn up by a notary-public, giving notice of some act of a public nature, as the protest of a bill of exchange.

PROTESTANT, a term first applied to the adherents of Luther, from their protesting against the decree passed by the Catholic states at the second diet of Speier in 1529. This decree had forbidden any further innovations in religion, and enjoined those states that had adopted the reformation so far to retrace their steps as to reintroduce the mass, and order their ministers to avoid disputed questions, and to use and explain the Scriptures only as they had hitherto been used and explained in the church. The essential principles involved in the protest, and in the arguments on which it was grounded, were: 1. That the Catholic church cannot be the judge of the reformed churches, which are no longer in communion with her. 2. That the authority of the Bible is supreme, and above that of councils and bishops. 3. That the Bible is not to be interpreted and used according to tradition or use and wont, but to be explained by means of itself—its own language and connection. As this doctrine, that the Bible, explained independently of all external tradition, is the sole authority in all matters of faith and discipline, is really the foundation stone of the reformation, the term Protestant was extended from those who signed the Speier protest, to all who embraced the fundamental principle

involved in it; and thus Protestant churches became synonymous with reformed churches. The essence of Protestantism, therefore, does not consist in holding any special system of doctrines and discipline, but in the source from which, and the way in which it proposes to seek for the truth in all matters of faith and practice; and thus a church might, in the progress of research, see reason to depart from special points of its hitherto received creed, without thereby ceasing to be Protestant. The symbols or confessions of the Protestant churches were not intended as rules of faith for all time, but as expressions of what was then believed to be the sense of Scripture. When, at a later time, it was sought to erect them into unchangeable standards of true doctrine, this was a renunciation of the first principle of Protestantism, and a return to the Catholic principle; for, in making the sense put upon Scripture by the reformers the standard of truth, all further investigation of Scripture is arrested, the authority of the reformers is set above that of the Bible, and a new tradition of dogmas and interpretation is created, which differs from the Catholic tradition only in beginning with Luther and Calvin, instead of with the apostolic fathers. See REFORMATION.

PROTEUS, in the Homeric or oldest Greek mythology, appears as a prophetic "old man of the sea" (*haliōs gerōn*) who tends the seal-flocks of Poseidōn (Neptune), and has the gift of endless transformation. His favorite residence, according to Homer, is the island of Pharos, off the mouth of the Nile; but according to Virgil, the island of Carpathos (now *Skarpanto*), between Crete and Rhodes. Here he rises at midday from the floods, and sleeps in the shadow of the rocky shores, surrounded by the monsters of the deep. This was the time when those who wished to make him prophecy sought to catch him. But it was no easy task. Proteus, unlike most vaticinal personages, was very unwilling to prophesy, and tried to escape by adopting all manner of shapes and disguises. When he found his endeavors hopeless, he resumed his proper form, and then spoke out unerringly about the future.

PROTEUS, a genus of perrenibranchiate batrachia (q.v.), having a long, smooth, naked, eel-like body; four small and weak legs; the fore-feet three-toed—the hinder, four-toed; the tail compressed and forming a kind of fin; the head lengthened and flattened; the eyes extremely small, and covered by the skin; the ears concealed in the flesh; the gills external and permanent, reddish, very conspicuous, between the head and the fore-legs. Notwithstanding the permanent external gills, there are also lungs in the form of simple slender tubes, terminated by a vesicular dilatation. The only known species, *P. anguinus*, is found in subterranean lakes, in the great limestone caverns in Carniola. It seems to live chiefly in the mud which forms the bottom of the lakes or pools; but almost nothing is known of its habits. It is of a pale rose or flesh color, 10 or 12 in. long, seldom above half an inch in thickness. Specimens have been kept alive in confinement for several years, in a darkened aquarium, apparently without food. One which ate a worm died soon after. The blood-corpuscles of the proteus are extremely large.

PROTEUS, a name given by many naturalists to certain animalcules remarkable for changefulness of form; on which account also, as the name proteus has been otherwise appropriated in science, they now receive the generic name *amœba* (Gr. vicissitude). They are *protozoa*, and ranked among the *rhizopoda*. See these heads. They are found in fresh water, and are generally from $\frac{1}{300}$ to $\frac{1}{800}$ of an inch in diameter, when they assume a somewhat globose form, which, however, they exchange for almost every imaginable shape, so that they cannot be described as having any proper or definite shape whatever. They consist of a transparent gelatinous substance (*sarcode*), or protoplasmic matter, which is divisible into two layers, an outer (*ectosarc*) and an inner (*endosarc*). The *ectosarc* is highly contractile, and can be protruded into blunt finger-like processes called *pseudo-podia* (false-feet), by which the animal is enabled to move along, and by which it procures its food, such as adiatom, which it draws into its substance, there being no mouth; and the effete matters are ejected from any part of its circumference. These pseudo-podia can be protruded from any part of the surface, and can be again retracted at the will of the animal. The only organs present in these animals is the *nucleus*, a dark, solid, refractive body, whose function is unknown; the *contractile vesicles*, which are spaces filled with fluid, and pulsate rhythmically; and other spaces called *food vacuoles*.

Reproduction takes place either by fission, or a single pseudo-podia separates and becomes a fresh amœba; or by the separation of a little mass of sarcode from the interior, the animal having become quiescent, and the nucleus and contractile vesicles disappearing. These little masses develop themselves into ordinary amœba.

PROTOCOCCUS (Gr. first-grain, a genus of *palmellacea* (q.v.), to which red snow (q.v.) is commonly referred.—Another species is *P. pluvialis*, not unfrequent in stagnating rain-water. It passes through various stages of growth, in which it has been described under various generic and specific names. In some of its stages, in which it moves by means of two long cilia, it has often been mistaken for an animalcule. Its color is usually green, but sometimes red; and the red matter often appears as a mere central nucleus, which has been mistaken for the *eye* of the animalcule. In its ordinary form it consists of a mass of colorless *protoplasma* (see CELLS), with red or green granules diffused in it, surrounded by a *primordial utricle* (see CELLS), and undergoing division into halves, which are soon surrounded by separate envelopes, and undergo division again; the new

cells thus formed, and they are formed with great rapidity, being sometimes set free by the dissolution of the original enveloping membrane, more frequently remaining imbedded in a gelatinous substance formed from it. The new cells often send forth two vibratile filaments or cilia, which spring almost from one point, often a kind of beak; and move with considerable rapidity; and in this state also, they multiply by binary subdivision; or they rest, become *encysted*, and divide into four. If slowly dried, the *P. pluvialis* retains life, and resumes its functions when again moistened.

PROTOCOL (Gr. *prōtos*, first, and *kolla*, glue), a word used in two senses: 1. The rough draft of an instrument or transaction; and more particularly the original copy of a government dispatch, treaty, or other document. 2. A record or register. In Scotland every notary, on admission to office, formerly received from the clerk-register a book called his protocol, in which he was directed to insert copies of all the instruments which he might have occasion to execute, to be preserved as in a record. At one time these protocols were attempted to be made available as records of sasines, but many causes operated to prevent their being thus used; they have, however, often been found serviceable, when regularly kept, to supply the loss of a missing deed.

PROTOGENE (Gr. first-born), a granitic rock, composed of the same ingredients as true granite, except that the mica is replaced by talc. It received its name because it was supposed to have been the *first-formed* granite. It abounds in the Alps, and is found also in Cornwall. The clay produced by its decomposition is greatly valued for the manufacture of china.

PROTOGENES, a celebrated painter of ancient Greece, was b. at Kaunos, in Caria, and practiced his art at Rhodes. Very little is known concerning him, except that he was a contemporary of Apelles, who was the means (see **APELLES**) of first drawing the attention of the Rhodians to his extraordinary merits. Pliny says that when Demetrios Poliorketes was endeavoring to conquer Rhodes, he took the utmost precautions to prevent any injury from happening to the studio of Protogenes, who then lived in a little cottage (*casula*) on the outskirts of the city, and even stole away at times from the turmoils of the siege to visit the painter, quietly and earnestly pursuing his work amid "the din of arms and the thunder of the battering-engines." Protogenes died about 300 B.C. He was a careful and elaborate painter, sparing no pains to secure a brilliant, natural, and finished piece of workmanship; and was apparently held in the highest estimation by the ancients. Cicero says that his pictures were perfect in every respect. The principal were: "A Satyr resting and holding his pipes;" "The *Paralos* and *Ammonius*" (or sacred ships of the Athenians, executed for the Propylæa at Athens); and "The Thesmothetæ" (for the Athenian senate-house of the five hundred).

PROTOHIPPIUS. See **HORSE FOSSIL**.

PROTONOPSIS. See **MENOPOME**, *ante*.

PROTO-NOTARY (Gr. *prōtos* first, and Lat. *notarius*, notary), the name given to a notary appointed by the holy see. Among the officials of the court of Rome is a body, twelve in number, called the college of notaries, who are to be distinguished from honorary or extraordinary apostolic notaries. The former are said to date from a very early time, and are charged with the official registration of all the solemn acts of the pope, whence they have a very special duty in relation to canonizations of saints, etc. Their number was fixed by Sixtus V. at twelve, and they enjoy many privileges. An apostolic notary-extraordinary, although called proto-notary, does not enjoy the same privileges. The proto-notary extraordinary may be named not only by the pope, but also by a legate (q.v.), and under certain restrictions, by the Roman college of notaries.

PROTOPHYTES (*Protophytā*, Gr. first plants), a name now frequently employed to designate the lowest or simplest organisms in the vegetable kingdom, corresponding to the *protozoa* of the animal kingdom. They are regarded as among the *algæ* (q.v.). Many of them are mere simple cells, which multiply by division, although perhaps they may yet be found to have also another mode of reproduction; others consist of cells united by a gelatinous substance, and the aggregate in some is a shapeless mass; in others, a plant-like structure, the form resulting from the mode in which the division of cells takes place. In none of them do the cells assume determinate characters in any part of the structure, so as to constitute different organs; in which they differ from all higher plants. It is sometimes very difficult to distinguish protophytes from *protozoa*; and perhaps the surest distinctive character is the nature of their food. Some of the *protozoa*, having no mouth, as the *protæus* or *amœba*, might be regarded as plants rather than animals; but they subsist by consuming organic particles, vegetable or animal, whilst protophytes live by appropriating inorganic substances, chiefly from the air or water around them. Among the protophytes are *palmellaceæ* (q.v.).

PROTOPLASM. See **CELLS**.

PROTOZOA (Gr. *prōton*, first, and *zōon*, animal), constitute the lowest animal sub-kingdom, and include a large number of animal beings of the lowest and simplest type of organization. Their bodies consist either of a simple cell or of an aggregation of cells, each of which seems to retain its independent existence. In none of the *protozoa* can a nervous system, or organs of sense, be detected; and except in one group (the *infusoridæ*)

there is no trace of a mouth. Excepting the sponges, they are generally of very minute size, and only to be observed with the microscope; and excepting a few that inhabit the bodies of other animals, all are aquatic animals. They generally present the appearance of a transparent gelatinous cell, containing a nucleus; in addition to which, one or more clear pulsating spaces, termed *contractile vesicles*, may be frequently seen. Excepting the infusoria, none present true reproductive organs, reproduction being usually accomplished by fission. They are divisible into the following groups or classes, each of which is noticed in a separate article: (1) *gregarinidae*, (2) *rhizopoda*, (3) *spongia*, and (4) *infusoria*; to which Green, in his *Manual of Protozoa*, adds *polycystina* and *thalassicolliada* (both of which are commonly included in the rhizopoda).

PROUD FLESH is the popular term for coarse and too luxuriant granulations (q.v.) springing up on wounds or ulcerated surfaces. Such granulations must be treated with nitrate of silver or sulphate of copper, either in the solid form or in strong solution.

PROUDHON, PIERRE JOSEPH, a noted French publicist and speculator on social and political subjects, was b. July 15, 1809, at Besançon, in which town his father was a poor cooper. Through the good offices of charitable friends, he received the rudiments of his education at the college of his native place, and from the first gave great promise of talent; while still very young, however, he quitted the institution in order to aid his family, which had fallen into great distress, and sought employment in a printing establishment. Here he was noted for the most punctual discharge of duty; and in the hours not occupied in work, he contrived, by a rare exercise of resolution, to complete and extend his education. In 1830 he declined an offer of the editorship of a ministerial journal, preferring an honorable independence as a workman, to the career of a writer pledged to the support of authority. He became partner in 1837 with MM. Lambert and Maurice in the development of a new typographical process; was engaged on an edition of the Bible, to which he contributed notes on the principles of the Hebrew language; and in 1838 published an *Essai de Grammaire Générale*; in approval of which, a triennial pension of 1500 francs was awarded to him by the académie de Besançon. On this accession of funds, he paid a visit to Paris; and subsequently contributed to the *Encyclopédie Catholique* of M. Parent Desbarres the articles *Apostasie*, *Alcoholypse*, and others. In 1840 he issued the work entitled *Qu'est-ce que la Propriété?* which afterward became so famous. The nature of the doctrine announced in it is sufficiently indicated in its bold paradox, soon to be widely popularized—*La Propriété, c'est le Vol*. At the moment it attracted little notice; and the sole results to its author were the withdrawal of his pension by the academy, on the score of his noxious opinions, and the threat of a prosecution, which, however, was departed from at the instance of M. Blanqui, the political economist, to whom reference in the matter was made. In 1842, for a repetition of offense in his *Avertissement aux Propriétaires*, he actually was prosecuted before the Cour d'Assises of Besançon, but succeeded in obtaining an acquittal. From 1843 to 1847 Proudhon was employed at Lyons, under MM. Gauthier, in the superintendence of a scheme of water-transport on the rivers Saône and Rhône; publishing during this time at Paris the two works entitled *De la Création de l'Ordre dans l'Humanité*, and *Système des Contradictions Économiques*.

With the outburst of the revolution of Feb., 1848, the opportunity of Proudhon had arrived. He instantly repaired to Paris, and on April 1st he came before the public as editor of the *Représentant du Peuple*, instantly, by his fierce and vigorous advocacy of extreme democratic and socialistic opinions, making his mark as a leading figure of the hour. His paper was suppressed in August following; but meantime, on June 4, no less than 77,094 enthusiastic admirers had voted him into the constituent assembly as representative of the department of the Seine. His career as a senator, if brief, brought him at least notoriety. *La Propriété, c'est le Vol*, though a maxim much commending itself to the moral sense of the hungry masses, naturally failed to find like acceptance with an audience mostly with some sous in the pocket. Proudhon soon ceased to address the assembly, for, so soon as he ascended the tribune, the indignant roar which saluted him rendered audible speech impossible. Under these circumstances Proudhon once more betook himself to his pen, and, as editor of three daily journals in succession, avenged himself on the adversaries who declined *viva voce* to listen to him, the chief victims of his savage personalities being MM. Ledru-Rollin, de Lamartine, Louis Blanc, Considerant, Cavaignac, etc. All three papers—*Le Peuple* (Nov. 23, 1848—April, 1849), *La Voix du Peuple* (Oct., 1849—May, 1850), *Le Peuple de 1850* (June 15—Oct. 13)—were in turn suppressed as anarchic and obnoxious. During their continuance he was repeatedly subjected to fines, which were defrayed for him by popular subscription.

In Jan., 1849, he attempted a reduction of his theories to practice by the institution of a *banque du peuple*. This project, which had for its object *la suppression du capital*, speedily experienced at the hands of "capital" the fate it had intended to inflict. The bank was closed by authority, and its originator fled to Geneva, to escape threatened imprisonment. In June, however, he returned, and his next three years were passed in the prison of St. Pelagie. While shut up there, he married. During his imprisonment he gave to the world the works entitled *Confessions d'un Révolutionnaire* (1849), *Actes de la Révolution* (1849), *Gratuité du Crédit* (1850), and *La Révolution Sociale démontrée par le Coup d'Etat* (1852); the last of which is remarkable, in the light of subsequent events,

for the clearness with which he states the alternative of *Fanarchie ou le Césarisme*, as pressed on Louis Napoleon, then president. In June, 1852, he was set at liberty; and quitting Paris, no longer a desirable abode for such unquiet spirits, went to Belgium, where he continued to publish from time to time on his favorite subjects of speculation. He died in obscurity at Paris, Jan. 19, 1865.

Monstrous as are the social theories with which, in the history of his time, the name of Proudhon remains connected, his power as a writer is not to be denied. It may be questioned how far he was at any time the dupe of his own paradoxes, or blind to the utter insufficiency of the premises from which, with a show of scientific rigor, he evolved his portentous results. It is related that in the negotiation of his marriage, he was very sharply solicitous as to the disposal of certain property possessed by the lady; and that on her notary venturing some surprised allusion to the famous *La Propriété c'est le Vol*, the philosopher gravely replied, "Be pleased, my dear sir, on such an occasion as the present, to be, if possible, a little serious."

PROUT, FATHER. See MAHONY, FRANCIS.

PROUT, SAMUEL, painter in water-colors, was b. at Plymouth in 1788. He evinced a strong love for nature at an early age. Mr. Britton, when about to collect materials for his *Beauties of England and Wales*, engaged his professional aid; and his drawings made for Britton's work attracted so much notice in London that he was induced to take up his residence in that city. In 1818, having been advised, on account of his health, which had always been delicate, to try a change of air, he went to Rouen by Havre; and the picturesque street-architecture and fine Gothic remains there made so strong an impression on his mind, that afterward, his principal works were those in which architecture had a prominent place; and from time to time, in his after-career, he made excursions, ransacking every corner of France, Germany, the Netherlands, and Italy, for picturesque architectural remains. Prout's name is dear to all the artists and amateurs of this generation, for there are few who have not been incited or instructed by his numerous elementary drawing-books, in the slightest of which talent and feeling for art are conspicuous. His water-color drawings are characterized by decision in handling, great breadth, and clear and pleasing coloring; good specimens are highly valued. He died at Camberwell Feb. 9, 1852. His character was amiable, and he was highly respected by his professional brethren.

PROVENÇAL LANGUAGE AND LITERATURE. See ROMANIC LANGUAGE; TROUBADOUR, *ante*.

PROVENCE, formerly a maritime province of France, in the extreme s.e. of the country, was bounded on the s. by the Mediterranean, and comprised the modern departments of Bouches du Rhone, Var, Basses-Alpes and the e. part of Vaucluse. It included a portion of the territory belonging to the Roman province of Gaul generally called *Provincia* ("the Province"), whence it derived its name.

PROVERBS (Lat. *proverbium*, a common saying or word, Gr. *paroimion*, a wayside saying, corresponding to Eng. byword) are pithy, practical, popular sayings, expressive of certain more or less general convictions. The definitions of the proverb are almost as numerous as its own varieties of form. Aristotle speaks of them as "remnants, which, on account of their shortness and correctness, have been saved out of the wreck and ruins of ancient philosophy." Agricola considers them "short sentences, into which, as in rules, the ancients have compressed life." Erasmus holds them to be "well-known and well-used dicta, framed in a somewhat out-of-the-way form of fashion." Cervantes explains them as "short sentences drawn from long experience." Johnson talks of them as "short sentences frequently repeated by the people." Less definitions of than general opinions on the proverbs, are sayings like that of Howell, that "sense, shortness, and salt" form their component parts. They are "the genius, wit, and spirit of a nation," according to Bacon. "The wisdom of many, and the wit of one," according to earl Russell. In them, it has been said, is to be found an inexhaustible source of precious documents in regard to the interior history, the manners, the opinions, the beliefs, the customs of the people; and their use has been strikingly pointed out by George Herbert, who entitled his collection of proverbs *Jacula Prudentium* (Darts or Javelins of the Wise), a term probably derived from Plato's *Protagoras*.

Yet there have, on the other hand, not been wanting those who, like lord Chesterfield, have deprecated their use in polite society, on account of their occasional vulgarity, and recommended stilted sentences à la Rochefoucauld instead. Of these solitary voices, however, no more notice was ever taken than they deserve. From the earliest historical times, proverbs have been household words, not merely among the people at large, but among the greatest and wisest of men. The prodigious amount of sound wisdom and good common sense they contain, the spirit of justice and kindness they breathe, their prudential rules for every stage and rank, their poetry, bold imagery, and passion, their wit and satire, and a thousand other qualities, have, by universal consent, made them the most favorite mode of imparting hints, counsels, and warnings.

Being emphatically sayings originated within or commonly adopted by the people, and handed down, in most cases, from the remotest antiquity, the question as to their origin and age is an exceedingly difficult one. Some of their sources have been pointed

out in the responses of oracles, in the allegorical symbols of Pythagoras, in the verses of the ancient poets, in mythological tales, in historical events to which they allude. That they existed to a great extent before the times of which written records have reached us, is clear from the number of them which lie imbedded—as a kind of well-known quotations—in these records themselves; and what tends still further to increase the difficulty of giving them a kind of fixed habitation within a certain country or age, is the circumstance that the same proverbs are found, as it were, among all nations and at all ages. From the east they were for the most part imported into Hellas, thence to Rome, and from thence they were scattered all over Europe, and partly brought back again, slightly altered, to the east. Even certain Jewish proverbs quoted by Christ and the apostles, which hitherto did not seem to offer any analogy in other languages, might be traced back to India, where they had existed for many long centuries before they found their way into the popular speech of Palestine and Babylonia, and thence into the Talmud. That the names of their authors should, as a rule, be lost, is not surprising; yet we do meet with single instances in which either the author of a proverb is well known, or others whose nationality and birthplace are easily recognized. In the former case, it is generally some memorable event in a celebrated man's life which is remembered in close connection with a certain striking sentence he then uttered. In the latter, the scenery, the circumstances, the history of a special country, may so unmistakably be pointed, that they leave no room for any doubts on the birthplace of the special proverb; and more than this, even the special period which gave it birth may be recognized by some trace of its character, manners, fashions, and occupations. "What is nearest and dearest to the heart of a nation, the aspect under which they contemplate life, how honor and dishonor are distributed among them, what is of good or of evil report in their eyes," as a recent writer has it, will surely be apparent in their national proverbs. Thus, for instance, the Greek proverbs may be designated as being fraught with a thorough knowledge of their own mythology, poetry, and history, bearing testimony to the high intellectual training that ran through all classes. The Roman ones—fewer in number, as far as they are the genuine growth of their own soil—have much less poetry about them, and are also deficient in the refinement and delicacy which were indigenous to Hellas. On the other hand, the character of the people comes well out in the constantly reiterated lessons of frugality, patience, perseverance, independence they inculcate; the practical hints as to marriage, education; and the various pursuits of that busy, vigorous, energetic nation—and among which agriculture played a prominent part. Of the proverbs now in use among European nations—calculated at about 20,000—the Spaniards are supposed to have a very large, if not the largest proportion. They may be recognized by a certain *grandezza*, a stateliness and thoughtfulness, blended though they be with humor and irony; and by the spirit of chivalry, honor, and freedom with which they are filled. The Italian proverbs, which come next as to quantity, are, to a certain extent, replete with a certain shrewdness and selfishness; and while they are fraught with unbridled passion, teach doctrines of cynicism and general distrust; yet, on the other hand, there are many of the noblest stamp, of a delicate refinement of beauty, of a subtle wisdom, teaching honor and honesty, plain-dealing and uprightness. In the same way, the French, the German, the English, as well as the Chinese and the Hindus, and every nation under the sun, impart a certain distinctive type and stamp to their homely sayings, which tells a distinct tale respecting their own inner life and national peculiarities. Of the Scotch proverbs, of which Kelly collected 3,000, it has been said that there is a shrewdness, although deficient in delicacy, about them; that they are "idiomatic, facetious, and strike home."

Of the general utility of the proverb it is needless to speak, after what we have said; we will only adduce the well-known frequent use made of them for ethical purposes in Scripture, which contains an entire book of them, ascribed, for the greater part, to the wise king himself; in the Midrash and Talmud, which contains, likewise, a whole collection of pithy sayings of the "fathers," or Mishnan teachers, and out of which several later collections have been compiled; in the patristic and later theological writers, who, like Luther, drew very largely upon these popular treasures.

Erasmus lays claim to be the first modern collector of proverbs, although Polydore Vergil, and not without a certain amount of truth, accuses him of plagiarism. His *Adagia* (Par. 1500) fired the learned in Europe with a desire to collect and to publish proverbs of their own countries. F. Nunez and the marquis of Santellama edited Spanish *Refranos*; Florio, an Italian, *Giardino di Ricerazione* (1591); which was followed by the Italian collections of Angelus Monozini and Julius Varini. Ondin published French proverbs as *Curiosités Françaises*. The first real German (Nether-Saxon) collection is due to Johann Agricola, whose *Gemeine Sprickwoerde* appeared in 1528. In England, Camden, Herbert, Howell, Fuller, Ray, Kelly, Behn, and others; in Germany, Weber, Sailer, Nopitzsch, etc., have issued national collections. Freytag and Burkhardt published *Arabie Proverbs*; Dukes, a small collection of Neo-Hebrew proverbs, etc. Thus, it may easily be seen, there is by no means a lack of material; and yet very little has been done toward the investigation and elucidation of the numerous points of interest connected with this subject. Disraeli's *Curiosities of Literature* contains a valuable essay on the "Philosophy of Proverbs," from which (as also from Eiselein's *Sprichwörter und Sinnreden*, 1840) archbishop Trench has derived a great deal of information for his excel-

lent little book, *On the Lessons in Proverbs*. Freytag's introduction to his collection of *Arabic Proverbs*, and that of Le Roux de Lincy to his French collection, make honorable exceptions to the general run of vapid prefaces to most modern collections.

PROVERBS, THE BOOK OF (Heb. *Mishle*, LXX. *Paroimia Salomontos*, Vulg. *Proverbia*), a canonical book of the Old Testament, containing an anthology of gnomes and sentences, the fruit of reflections on the Mosaic law and on the divine guidance of the people of the Israelites. It is also called the "Book of Wisdom," inasmuch as it embraces the doctrines of the old covenant crystallized into religious maxims of thought, will, and action. Practical piety is enjoined under the name of "life," while "death" represents sin throughout. The form of these proverbs is manifold—similes, enigmas, theses and antitheses, wise sayings, gnomes, comparisons, etc., vary constantly. The book is divided into three sections, to which the two last chapters form an appendix. The first section (chaps. i.-ix.) contains a description and a recommendation of wisdom as the highest good obtainable, and is further subdivided into three portions. The second (x.-xxiv. 34) is equally in three portions, in the first of which the sentences are very loosely strung together; while, in the second, they are joined into more continuous utterances, sometimes running through several verses; and the third, which has the inscription: "These, too, are of the wise men," contains, again, some single sentences, principally in the form of commandments and prohibitions. The third section (xxv.-xxix.) is inscribed: "These are also proverbs of Solomon, which the men of Hezekiah king of Judah copied out," and is somewhat different from the former by the more predominant form of theses and antitheses, catch-words by which an association of ideas is produced, and similes. The first chapter appended (xxx.) contains the proverbs of Agur, which, in a very artificial garb, teach the true wisdom and its practice in life; the second (xxxi.), inscribed: "Words of king Lemuel, the prophecy that his mother taught him," contains from verses 1-9 wise maxims for a king, anent chastity and temperance, and from 10-31, the praise and properties of a good wife, in the form of an alphabetical song. Tradition has ascribed the authorship of this book to Solomon, "the wisest of men;" but although neither the language, nor the structure, nor—as has principally been urged—the contents, are of a nature to convince us of the absolute necessity of assuming various authors and various epochs, there is no doubt a strong presumption in favor of this hypothesis. Who the Agur was that is mentioned as the author of the last chapter but one, is not easily conjectured. Equally unsatisfactory are the results of the speculations about the reputed author of the last chapter, Lemuel, by some supposed to be the brother of Agur. Probably it is nothing more than a symbolic name. The last section (xxxi. 10-31)—an alphabetical acrostic—probably belongs to the 7th c. B. C., and by its language and form, does not appear to belong to the author of the preceding part of the chapter. The nucleus of the book is formed by the second section (x.-xxii. 16), to which the first (i.-ix.) was added by way of introduction, and the third as the concluding portion. Whether that first anthology (from the 3,000 proverbs of Solomon mentioned 1 Kings iv. 32) was collected and redacted (into section two) during Solomon's lifetime, is very doubtful; so much, however, is certain, that the learned men at the time of Hezekiah undertook their additional collection with a view to a then already existing portion. It may not be superfluous to add, that Jerome, misled by 1 Kings iv. 32, erroneously states our book of proverbs to contain the 3,000 proverbs there ascribed to Solomon. The canonicity of the book is matter of controversy in the Talmud; there seems to have been at one time an objection to receive it among the number of sacred books, on account of certain contradictions contained in it; this objection, however, was overruled, and it occurs in the order of the Hagiographa (Kethubim) of the Masoretic code, generally between Job and Ecclesiastes. The order followed in the authorized version had been adopted already in the time of Jerome.—Principal writers on Proverbs are Ewald, Bertheau, Hitzig, Elster, Rosenmüller, Hirzel, Umbreit, M. Stuart, and Dr. Noyes.

PROVIDENCE, in theology, is God's wise and powerful preservation and government of his creatures and works. By preservation is meant that all creatures and things, with their powers and properties, are continued in existence by the will and power of God. Some regard this as a continual creation; which others deny, since, as they affirm, calling into existence is a different thing from continuing in existence; in the former there can be no co-operation with second causes; but in the latter God's power acts in connection with them. The question is one of metaphysics. The government of the universe includes the great end which God designs to attain, and the means and processes by which it is to be accomplished. These imply an intelligent control over all physical forces, intellectual powers, and moral agencies. 1. The fact of providence may be inferred from the fact of creation. The supposition that God would create this vast universe, and leave it without care, either for its preservation or its accomplishment of the design for which he created it, is absurdly contrary to the divine wisdom which creation itself displays. There must be a providence proportioned to creation, and as the whole universe has been created, providence must extend over it all. 2. Providence is actually exhibited through the universe, in the preservation of it, through long periods of time. The design to preserve it and processes by which it is preserved are manifested through it all. The continual exercise of government is like-

wise exhibited over its physical, mental, and moral forces. 3. The religious nature of man instinctively believes in a universal providence. It recognizes human dependence on God and responsibility to him. It believes in his moral government as exercised in this world. It believes in intercourse with him. It is naturally prompted to call on him in trouble, danger, and want. It fears the exercise of his justice towards transgressors; it feels its need of his mercy. All this would be a delusion, imposed on the nature of man by its creator, if there were no universal providence corresponding to it. Some indeed attribute the existence of all religious convictions to education. The answer to them is, that the sense of dependence, responsibility, and obligation, and of divine government over men, is too general to be accounted for by education. Who are the educators? it may be asked; and who educated them? 4. The Scriptures affirm the providence of God; declaring that he upholds all things by the word of his power; that in him men live, move, and have their being; that his government is universal, extending over all creatures and all their actions; that it is all-powerful, rendering certain the accomplishment of all his plans; that it is infinitely wise in the ends which it proposes, in the means which it employs, and the control which it exercises over creatures and things; and that it is holy, doing, requiring, and ultimately allowing, nothing inconsistent with justice, truth, and love. Some professing to believe in a general supervision and government over the universe deny that it extends to particular persons and things. To this it has been answered that there can be no general providence which is not also particular. The general is made up of the particulars. Care over the one includes care over the others. Some say that care over minute and insignificant things is beneath the greatness of God. To this the answers are: (1) If to create the little was not beneath God, to take care of it cannot be; (2) the greatest things are made up of things indefinitely small; (3) the qualities of things are lodged in the elementary particles, that are immeasurably little. Some deny that the providence of God can deal favorably in any wise with the unworthy and guilty. But in reply it is urged, that guilt increases the need that men should be cared for; transgressors cannot be neglected under a moral government; that God's goodness is displayed towards the evil as well as the good; and that his grace to sinners is manifested as the crowning wonder of his providential government.

PROVIDENCE, a co. in n. Rhode Island, adjoining Connecticut and Massachusetts; drained by the Blackstone and Pawtuxet rivers, intersected by the railroads centering in the city of Providence (q.v.); 400 sq.m.; pop. '80, 197,874—139,079 of American birth. The surface is uneven and well wooded. The soil is moderately fertile. The principal productions are hay, corn, and potatoes. Manufacturing of jewelry, machinery, cotton and woolen goods, and other articles is extensively carried on. Co. seat, Providence.

PROVIDENCE, a city, semi-capital, and seaport of the state of Rhode Island, U. S., situated at the head of navigation, on an arm of Narragansett bay, known as Providence river, 35 m. from the ocean, 43 m. s.s.w. from Boston, and 160 n.e. of New York. It is the second city in New England, covering nearly 15 sq.m. on both sides of the river, which, above its two bridges, expands into a cove, a mile in circuit, on the borders of which is a handsome park, shaded with elms. It is a city of large commerce, manufactures, and wealth, abounding with beautiful villas and gardens. Two small rivers afford water-power to extensive manufacturing establishments. There are 10 daily and other papers, the oldest of which was established in 1762; 76 churches, among them the oldest Baptist church in America, established in 1638 by Roger Williams; hospitals and asylums; a state prison, which had, in 1874, 67 convicts, making cabinet-work and shoes, and earning \$3,000 a year over their expenses. Among its institutions are: Brown university; an atheneum, with a library of 34,000 volumes; a liberally endowed college of the society of Friends; a Roman Catholic institute; Franklin lyceum; 4 grades of free schools; 45 banks; 20 insurance companies; 10 railways, all but two uniting in one central station; several lines of steamboats; 50 cotton factories, 25 woolen; numerous iron-works; several bleaching and calendaring mills; 5 large screw-mills, making 5,000 tons a year; and 150 manufactories of gold and silver ware and jewelry. Providence was settled in 1636 by a colony of refugees from Massachusetts under Roger Williams. Pop. '75, 100,675.

PROVIDENCE (*ante*), is the principal port of entry and one of the capitals of Rhode Island, and the shire town of Providence county. It was incorporated as a town in 1649, and as a city in 1832. During the 140 years after its settlement the town increased slowly, and in 1776 the population was only 4,355; but after the close of the revolution it began to increase steadily. By the last census, 1880, its population was 104,852. The city is a place of much wealth, the center of a large manufacturing district, and has an extensive trade, especially in cloths, chemicals, dyestuffs, coal, etc. Its manufactures include cotton and woolen goods, iron, gold, and silver wares, and numerous other articles. During 1875 the value of the products of woolen manufactures was \$4,291,573; of the cotton manufactures, \$1,874,300; of calico prints, \$3,850,338; and of iron manufactures, \$8,488,402. The manufacture of jewelry, however, is the most extensive industry in the city, the annual product being about \$5,000,000. The iron manufactures include steam engines and boilers, butt-hinges, screws, locomotives, muskets, iron castings, and

others of less importance. There are also several bleaching and calendering establishments, and manufactories of alarm bells, toilet and laundry soaps, ribbons, etc. The commerce of the city is confined chiefly to the coasting trade. For the year ending in June, 1875, the exports amounted to \$23,086 and the imports to \$566,459. Some of the receipts by vessels and railroad were: cotton, 249,897 bales; flour, 345,440 barrels; grain, 2,107,000 bushels; and coal, 691,847 tons. Of the railroads which connect the city with the principal points in New England, the most important are the Boston and Providence, the Hartford, Providence, and Fishkill, the Providence and Springfield, the Providence and Stonington, the Providence and Worcester, and the Fall River, Warren, and Providence. Steamboat lines connect the city with New York, Philadelphia, Baltimore, Norfolk, and Charleston.

The charitable institutions are numerous and well supported, and the incorporated educational institutions, as well as the public schools, have a high character. In 1874 there were 76 public schools, having 325 teachers, and a regular attendance of 12,439 pupils. The city is the seat of Brown university, (q. v.) The religious organizations include 13 Baptist, 2 Christian, 7 Congregational, 12 Episcopal, 1 Evangelical Lutheran, 5 Free Baptist, 1 Friends, 2 Jewish, 10 Methodist Episcopal, 1 Presbyterian, 10 Roman Catholic, 3 Unitarian, and 2 Universalist.

The city is divided into 10 wards, and its government is vested in a mayor, with one alderman and 4 councilmen from each ward. The valuation of real estate in 1874 was \$81,040,300; personal estate, \$42,642,500; rate of tax, \$14.50 per \$1000; amount of tax, \$1,793,400. The city's expenditures during 1874 were \$7,505,590, of which \$6,158,354 were classed as extraordinary, leaving a balance in the treasury of \$462,843. At that time the funded debt amounted to \$5,400,000, and the floating debt, \$2,043,800.

PROVINCE, ECCLESIASTICAL. After the state had become Christian under Constantine, the church took her model of ecclesiastical territorial division from the state, and as the empire was divided into provinces and dioceses, these terms continued to be used in regard to ecclesiastical jurisdiction. The term province now denotes a union of several dioceses under an archbishop, and may include several states, a country, or several countries. In the United States the Roman Catholic church has 12 provinces, each province comprising several dioceses. In the divisions for the order of Jesuits, North America is considered a province, having a superior to whom all the members are subject.

PROVINCETOWN, a t. in s. e. Mass., at the extremity of Cape Cod; pop. '80, 4,345. It is 4 m. long by 3 m. in width at its widest portion, forming a convenient curve to shelter a harbor s. e. of the town, 3 by 5 m. in area, 30 fathoms deep, and free from sand-bars and rocks, while the coast outside is the terror of seamen. It contains 3 marine railways, 30 wharves, a national bank with a capital of \$200,000, a savings-bank, and 3 marine insurance companies with an aggregate capital of \$250,000. It has a well-organized fire department, a weekly newspaper, public schools, hotels, a public library of 2,200 vols., and 5 churches. The houses are built principally of wood, the main street running parallel with the shore, crossed at right angles by shorter ones, the scorching heat of the sun on the sand being tempered by beautiful shade trees. As a summer resort it possesses peculiar attractions. Many of the inhabitants are engaged in cod and mackerel fishing, thousands of barrels of fish annually being caught, and in 1875, 185 vessels were owned in the town. It is 55 m. by water from Boston; 118 m. by rail, the Old Colony railroad terminating at one of its s. wharves.

PROVINCIAL OF AN ORDER is the superior of all the houses, and all the members of a monastic order, within any particular province. The office is generally held for a stated term of years, and in most orders the appointment to it rests with the general (q. v.).

PROVINS, an old t. of France, in the department of Seine-et-Marne, 59 m. e. s. e. of Paris, occupies a valley irrigated by two streams, the Darstein and the Voulzie, whose waters are employed to turn 50 or 60 corn-mills in the district. It is surrounded by ancient walls, flanked by ruined watch-towers, and is divided into the high and low towns. In the former is an ancient tower built during the middle ages, but vulgarly called the *tour de César*. The vicinity was long famous for its roses, still cultivated to a considerable extent. Pop. '76, 7,176.

PROVISION (Lat. *provisio*, from *providere*, to provide), in church law, means the bestowing an ecclesiastical benefice, and involves two stages—the designation of the person on whom it is bestowed, and the actual collation (Lat. *collatio*) of the benefice, which is completed by his taking possession. Both these acts fall properly to the ecclesiastical authority; but by usage of a very early date, the state, and often individuals, are admitted to a share in the provision of ecclesiastical benefices. In the mediæval church the claim of the sovereign to the provision of vacant bishoprics was often the subject of contention with the popes (see **INVESTITURE**), but at all times the right of final and complete provision was admitted to belong to the pope. In later times, this claim has commonly been regulated by concordat. In most Roman Catholic countries the crown elects to bishoprics, and the pope is bound to confirm the nominee of the crown, unless canonical cause of rejection should appear. In the Russo-Greek church the candidates are presented by the holy synod, and the czar names the bishop from among them. In Protestant countries the election to benefices and dignities in the Roman Catholic

church is generally by the chapters; but in some of them, as in Holland, Prussia, Hanover, a qualified veto is permitted to the crown. In the church of England the bishop is nominally elected by the chapter; but, in reality, the members of the chapter are only permitted to name the particular person whom the crown presents to them for election with the *congé d'élire*. In the Roman Catholic church of England and of Ireland, the parochial clergy, together with the canons, recommend three candidates, one of whom is commonly, although not necessarily, appointed by the pope. The conditions and usages of provision to parochial and other benefices have been explained under the head institution (q.v.). The completing act of provision is the installing in possession, which is described under the head induction (q.v.).

PROVISIONAL ORDER is an order granted under the powers conferred by an act of parliament, by a department of the government, by the secretary of state, or by some other authority, whereby certain things are authorized to be done, which could be accomplished otherwise only by an act of parliament. The order does not receive effect, however, until it has been confirmed by the legislature. Till that time, it is purely provisional; and even after it has been so confirmed, and is in reality an independent act, it retains the title of a provisional order.

Provisional orders have been in operation in England for many years, and have been found most useful in facilitating the modification or extension of the provisions of general acts, so as to adapt them to the special necessities of particular districts. A general statute, dealing with an extensive subject like police or sanitary improvement, could only embrace provisions suited to the requirements of the country generally, and could not be so framed as to meet exceptional circumstances. When these had to be provided for, private legislation was necessary; but the cost and delay attendant upon the promulgation of local acts in the usual way were so great as in many cases to be practically prohibitory. What was needed, therefore, was a ready and inexpensive mode of obtaining local legislation, and the system of provisional orders was devised to meet that want. The general act embodied legislation generally applicable, and gave power to some board or officer to issue provisional orders, whereby the general act might be better applied to special districts or under peculiar circumstances. Such powers were by the public health act, 1848 (11 and 12 Vict. c. 63), conferred on the general board of health thereby constituted, but were by the local government act, 1858 (21 and 22 Vict. c. 98), transferred to the secretary of state. The turnpike trusts act, 1851 (14 and 15 Vict. c. 38), empowered the same functionary to grant orders in reference to the objects of that act; while the piers and harbors act, 1861 (24 and 25 Vict. c. 45), authorized the board of trade, with the sanction, in certain cases, of the admiralty and commissioners of woods and forests, to issue provisional orders dealing with a variety of important matters connected with the construction of piers and harbors, and the levying of dues and rates. The lands drainage act, 1861 (24 and 25 Vict. c. 133), gave power to the inclosure commissioners to issue orders for the purposes specified in that act; and the merchant shipping amendment act, 1863, gave, relatively to its objects, corresponding powers to the board of trade.

All these acts were in full and beneficial operation in England when the general police and improvement (Scotland) act, 1862 (25 and 26 Vict. c. 101), was passed, and it conferred extensive powers on the secretary of state in relation to the granting of provisional orders for police and sanitary purposes. Subsequently, the Irish drainage and improvement of lands acts of 1863 and 1864 (26 and 27 Vict. c. 88, and 27 and 28 Vict. c. 72) enabled the commissioners of public works, and the oyster and mussel fisheries act, 1866 (29 and 30 Vict. c. 85), enabled the board of trade to issue orders in relation to the subjects of these acts respectively.

Nothing can be more diversified than the objects to be attained by provisional orders under the several acts above alluded to, and yet the course of procedure in relation to them all is substantially the same. A petition to the proper authority, specifying what is wanted, and supported by such evidence as can accompany the application, is made the subject of inquiry by a qualified person commissioned for the purpose. After due inquiry has been made, and the result has been reported to the authority to which the application is addressed, the petition is disposed of, either by giving or refusing what is asked, or by giving it in a modified form. When a provisional order is granted, steps are taken on behalf of the government to have it confirmed by parliament. In the case of orders issued under the general police and improvement (Scotland) act, for example, the requisite confirmation bill is framed, under instructions from the secretary of state, by the lord advocate, who takes charge of the measure through its various stages. When unopposed in parliament, ten days or a fortnight usually suffice for the passing of the requisite confirmatory act, which has all the facilities of a government measure. Of course, the whole expense connected with the preparation and passing of the order, and the relative confirmation act, is defrayed by the applicants; but the advantages of provisional orders, compared with ordinary private bills, are nevertheless considerable. A provisional order may be got with greater expedition and at much less cost than a private bill. It is exempted from the tedious and costly formalities of complying with standing orders and making deposits, with all the formidable fees of the house, and other incidental charges. When opposition is offered, the opponents are

fully heard by the commissioner appointed to make the requisite inquiries; and the grounds of opposition are deliberately weighed, first by him, and afterwards by the superior authority to whom he makes his report. The opponents have thus the satisfaction of knowing that their case has been considered, with probably the same result as if it had been submitted at much cost to a parliamentary committee. There is, therefore, little inducement in ordinary circumstances to appeal directly to the legislature; and, as a consequence probably, an opposition to a provisional order in parliament is exceedingly rare. No doubt, if an opposition on feasible grounds were offered to a provisional order in parliament, the whole subject would be referred to a select committee, who would probably proceed as in the case of an opposed private bill; but that, as has been observed, is of so rare occurrence, that it does not detract from what has been said in regard to the advantages of the system as a rule.

PROVISORS, STATUTE OF. The object of this statute, 25 Edward III. st. 6, was to correct, and put an end to, the abuses which had arisen in the exercise of the papal prerogatives as to the disposal of benefices in England. See **BISHOP; PATRONAGE.**

PROVOOST, SAMUEL, D.D., 1742-1815; b. New York. He was descended from a Huguenot family, but at an early age entered the Episcopal church; graduated at King's (now Columbia) college in 1758; went to England in 1761, and entered as fellow-commoner of St. Peter's college, Cambridge, and was ordained. Returning to New York he became assistant minister at Trinity church; resigned in 1770 and retired to a small farm in Dutchess co., devoting himself chiefly to literary and scientific studies until near the close of the war. In 1783, on the evacuation of New York by the British troops, he returned to the rectorship of Trinity church, where he remained for 17 years. In 1785 he was chaplain to the continental congress. In 1786, at the first general convention of the church, he was elected bishop, and proceeding to England was consecrated at Lambeth in 1787 by the archbishop of Canterbury. In 1789 he was chaplain to the United States senate. In 1800 he resigned the rectorship of Trinity church, and in 1801 the bishopric. The latter was not accepted, but Dr. Benjamin Moore was chosen his assistant. Bishop Provoost wrote a copious index to the *Historia Plantarum* of John Bauhin.

PROVOST (Lat. *propositus*, set over), in church law, the chief dignitary of a cathedral or collegiate church, from which use the title has also been transferred to the heads of other similar bodies, whether religious, literary, or administrative. Properly, however, the name is given to the highest dignitary in the metropolitan or diocesan chapter, and is often held conjointly with the archdeaconry. The provost is the next in dignity after the archbishop or bishop, a position which is also the right of the provost of a collegiate chapter. The name is also given to the superiors of certain religious houses of lesser rank, and the relation of which to the more important houses is analogous to that of the priory to the abbey. It was also given to certain lay officials, whose duties, in relation to the church and the maintenance of its material condition, were similar to those of the modern church-warden. In the Protestant church in Germany, the name provost is sometimes used as synonymous with that of dean or arch-priest; and occasionally, where several minor churches or chapels are attached to one chief church, the minister of the latter is called "provost."

In England the heads of several colleges in the university of Oxford, and the head of King's college, Cambridge, are designed provost. The head of Eton college is also so called. The provost of the mint is a judge appointed to apprehend and prosecute false coiners.

In Scotland the chief municipal magistrate of a city or burgh is called provost, the term corresponding to the English word mayor. The provost presides in the civic courts along with the bailies, who are his deputies. The chief magistrates of Edinburgh and Glasgow are styled lord provost, and the claims of the provosts of Aberdeen and Perth to the designation of lord, although at one time contested, are now held to be fully established. The right to this distinction does not seem to depend on anything peculiar in the nature of the constitution of these municipalities, but on its being expressly conferred by the crown, or sanctioned by royal usage. The lord provost of Edinburgh is entitled to the prefix "right honorable," which may be attached not merely to the name of his office, but to his Christian name and surname, a usage which probably originated in the circumstance that the lord provost of Edinburgh was *ex officio* a member of the old Scots privy council. Within the city and liberties of Edinburgh, the lord provost takes precedence next after members of the royal family. The lord provost of Glasgow is generally styled the "honorable," a prefix, however, which belongs only to his office, and cannot be attached to his name.

In France, there were formerly various descriptions of inferior judges, known under the name of provost (*prévôt*). The grand provost of France had jurisdiction in the king's house and over its officers.

PROVOST MARSHAL, in the *navy*, is a person appointed to have charge of a prisoner before a court-martial, and until the sentence of the court is carried into execution. In the *army*, the provost-marshal is an officer, with the rank of capt., appointed to superintend the preservation of order, and to be, as it were, the head of the police of any particular camp or district. He has cognizance of all camp-followers, as well as of members of the

army. His power is summary, and he can punish an offender, taken *flagrante delicto*, on the spot, according to the penalties laid down in the mutiny act.

PROW (from the Latin *prora*) means, generally, the fore-part of a ship, or more especially the beak or pointed cut-water of a galley, polacre, or xebec.

PROXY (contracted for procuracy), the agency of one person who acts as substitute for another. Every member of the house of lords can (by license, in theory supposed to be obtained from the sovereign) appoint another lord of parliament his proxy to vote for him in his absence. A spiritual lord can, however, only be proxy for a spiritual lord, and a temporal for a temporal lord, and no peer can hold more than two proxies at the same time. Proxies cannot be used in judicial cases, or where the house is in committee, nor can a proxy sign a protest.

PRUDENTIUS, AURELIUS CLEMENS, a Christian poet of the 4th c., was a native of Spain, and was b. 348 A.D. Nothing is known regarding him except what he has himself told in a poetical autobiography prefixed to his works. From this we learn that he received a liberal education, was admitted to the Roman bar, practiced as a pleader, discharged the functions of civil and criminal judge, and was ultimately appointed to a high office at the imperial court. The year of his death is not known. In his youth, Prudentius was fond of pleasure, and very dissipated; but as he grew old, he became very devout, and his writings (which are all in Latin verse) reflect the latter phase of his character. The principal are—1. *Cathemerinon Liber* (Book [i.e., of hymns] for Daily Use), being a series of twelve hymns, the first half of which were reckoned by the author suitable for devotional purposes at different parts of the day; 2. *Apotheosis* (a defense of the doctrine of the Trinity against heretics); 3. *Hamartigenia* (On the Origin of Evil, a polemic, in verse, against the Marcionites); 4. *Psychomachia* (The Triumph of the Christian Graces in the Soul of a Believer); 5. *Contra Symmachum, Liber 1* (a polemic against the heathen gods); 6. *Contra Symmachum, Liber 2* (a polemic against a petition of Symmachus for the restoration of the altar and statue of Victory cast down by Gratian); 7. *Peri Stephanōn Liber* (14 poems in praise of Spanish and other martyrs for the faith); 8. *Diptychon* (48 poems of four verses each, on Scriptural incidents and personages). Bentley calls Prudentius "the Horace and Virgil of the Christians," which may be true enough if the critic only meant to say that Prudentius is the first of the early Christian verse-makers; but is ridiculous if he intended to hint at a comparison with these masters of poetic elegance and grace.

PRUD'HOMMES, COUNCIL OF (from Latin *homo prudens*), municipal tribunals, which existed first in the middle ages at Marseilles, Lyons, and perhaps elsewhere in France, exercising an equitable jurisdiction as arbiters of disputes between masters and workmen. Similar tribunals, under the same name, were re-introduced by Napoleon I. in 1806, and have been found of great practical utility. They now exist—or recently existed—in Lyons and Paris. They were instituted in the former town in 1806, in favor of the silk trade and other trades immediately connected with it. The council consists of manufacturers, mercers, master-workmen, foremen, dyers, and common workmen, elected among themselves. The council is empowered to dispose finally of all differences between manufacturers and their workmen, or between master-workmen, companions, and apprentices, where the sum in dispute does not exceed 200 francs; and it may also take cognizance, subject to an appeal to the tribunal of commerce or tribunal of first instance, of similar disputes, whatever their amount. Other functions of a miscellaneous nature belong to the council of prud'hommes, including the inspection of the workshops, in order to obtain information regarding the number of looms and of workmen, and the giving an opinion, when required by the administrative authorities, on any question submitted to it. In 1844 a council of prud'hommes was established in Paris in favor of the metal trade, and all trades connected with it; and three new councils of the same kind were instituted in Paris in 1847—one connected with the manufacture of tissues of all kinds, another with the manufacture of chemicals, and a third having jurisdiction in all other trades.

PRUNEL'LA, a genus of plants of the natural order *labiata*, having the upper lip of the calyx 3-toothed, the lower lip bifid; the upper lip of the corolla arched and nearly entire; the lower lip 3-lobed; and four filaments, each with two teeth at the extremity, of which one bears the anther. Several species are natives of Europe; one only is found in Britain, *P. vulgaris*, popularly known as SELF-HEAL, a plant very frequent in moist and barren pastures, as it is also throughout most parts of Europe, central Asia, North America, and New Holland. It has oblong-ovate stalked leaves, and violet-blue flowers, very densely whorled, so as to form an imbricated oblong spike. It was at one time in considerable repute as a febrifuge. It is mildly aromatic and slightly astringent.

PRUNES are dried fruit of the plum-tree (*prunus domestica*), of the variety called *Juliana*, which is so largely cultivated in France, that not only is that country supplied, but Britain also imports from thence over 400 tons per annum. They are much used in the manufacturing districts of England by the operatives, who make puddings and pies of them when fresh fruit is out of season. The very fine kind which are sold in highly ornamental boxes are called French plums or table prunes; these are a much finer variety, viz., *Catherinea*, which are much larger, and, when ripe, are much sweeter.

They are more carefully prepared, being gathered by hand, and separately dried. They are used chiefly as a dessert fruit. The imports of these into Britain amount to upward of 200 tons per annum.

PRUNING, the removal of branches from fruit or forest trees, in order to the greater production of fruit, the improvement of the timber, or purposes of ornament. In pruning for ornamental purposes, taste must chiefly be consulted, but reference must be made to what has been too little regarded in pruning of every kind—the nature or habit of the tree itself. Some trees will bear clipping into fantastic forms, which would be utterly destructive of others. Such forms, once esteemed as the finest ornaments of a pleasure-ground, or the neighborhood of a mansion, are rejected by the simpler taste of the present age, and the *topiarian art* has few admirers. Much may be done, however, by the removal of branches, to give a finer form to ornamental trees; but in this, as in the pruning of trees grown for the sake of their timber, a great mistake is very generally committed in permitting branches to grow to a considerable size before they are cut off. It may be accepted as a general rule, that the branches removed should be small in proportion to the whole bulk of the tree. The removal of twigs and small branches is attended by no bad effects, and may be beneficial; but the removal of large branches is dangerous. The leaving of stumps or snags is an aggravation of the evil. They rot away, and spoil the timber of the stem; indeed, a hole is not unfrequently formed. But as to forest trees, pruning may with great advantage be in great part avoided, by taking care to plant at proper distances, and thinning out the plantations sufficiently in early periods of their growth. In this way, better timber is obtained, and a greater produce from the land. Pines and firs scarcely ever require pruning, and are probably in almost all cases the worse of that which they get, except in the removal of those lower branches which have actually begun to decay. In other trees, it is sometimes of importance to watch for branches that would divide the trunk, and to prevent the division, causing the main stem to ascend higher before it forms a crown; but to be of any use, this must be done while the branches are still very young. Plantations should, therefore, be examined with a view to pruning, at intervals of not more than two years, after they are six or eight years old.

In orchards and fruit-gardens, pruning is necessary, the object being not to produce timber, or the utmost luxuriance of trees, but fruit in the greatest perfection and abundance. The habits of each kind must be studied. Even in the pruning of gooseberry and currant bushes, regard must be had to natural diversities, the gooseberry and black-currant producing fruit chiefly on young wood, while the red and white-currant produce fruit chiefly on spurs from older branches. And so it is among trees; apricots, for example, producing fruit chiefly on young wood; cherries mostly on spurs, while plums produce both in the one way and in the other. The object of the gardener in pruning is to bring the tree into the condition best suited for producing fine fruit and in the greatest abundance; and to this the training of wall trees (q.v.) must also be accommodated. Sometimes, in order to produce particularly fine fruits for the improvement of the variety by seed, or for the sake of a prize at a horticultural exhibition, the gardener diminishes the number of branches likely to bear fruit, beyond what would otherwise be desirable.

The general seasons of pruning are winter and spring; but some trees, particularly cherries, are advantageously pruned in summer, as they then throw out less gum.

Pruning instruments are of various kinds—knives, axes, saws, bills of very various forms, etc., and the *avunculator*, which may be described as a pair of scissors, one blade hooked or crooked, attached to a long handle, and working by a cord and pulley. It is scarcely used except for standard trees in gardens and orchards.

PRUNUS. See PLUM.

PRUNUS VIRGINIANA. See CHOKE-CHERRY, *ante*.

PRURIGO is a non-contagious affection of the skin, in which intense itching is the most prominent symptom. Sometimes the parts affected present no marked deviation from the normal type, but most commonly they are covered with papule, which are nearly of the same color as the skin. Hence prurigo has been placed among the popular diseases of the skin. William makes three varieties of this disorder—viz., *P. mitis*, *P. formicans*, and *P. senilis*. This affection seldom affects the whole surface; its favorite seats being the neck, the shoulders, the back, the outer surface of the limbs, the arms, etc. In *P. formicans* there is not only intense itching, but patients complain of a feeling like the creeping of ants (hence the specific name) or the stinging of insects, or as if hot needles were thrust into the skin. All the forms of this disease are aggravated by exposure to the air, and by heat, and the sensations are often so distressing after the patient has become warm in bed, as to prevent sleep for many hours. *P. senilis*, occurring, as its name implies, in old persons, is characterized by the extreme severity and permanence of the itching, and by the obstinacy with which it resists every kind of treatment. The different varieties of this disorder may probably be often traced either to disease of the digestive system, or to want of personal cleanliness; but in most cases their origin is obscure.

In the treatment of this disease, attention should be paid to the diet. All stimulating condiments and drinks should be forbidden, and only a plain, easily digested food

allowed. Internal remedies are seldom of use excepting opium, which in severe cases is required in free or large doses, in order to procure rest. The local applications that have been recommended are very numerous. Lotions of spirit, diluted vinegar, solution of acetate of ammonia, glycerine, prussic acid, etc., and ointments containing creasote, iodide of sulphur, aconitine, etc., have been advocated by various physicians of eminence. Unless, however, the greatest attention is paid to personal cleanliness, no remedy is likely to be of permanent benefit.

PRUSA, or PRUSIAS. See BROUSA, *ante*.

PRUSSIA (Ger. *Preussen*), a kingdom embracing nearly the whole of northern Germany. It is bounded n. by the German ocean, Jutland, and the Baltic; e. by Russia and Poland; s. by Austria, Saxony, Saxe-Altenburg, Saxe-Weimar, Gotha, and others of the smaller German states, Bavaria, Hesse-Darmstadt, and Alsace-Lorraine; w. by Belgium and the Netherlands. Prussia owns besides the detached domains of Hohenzollern (q. v.) and Jaede or Jahde on the North sea, which lie within the boundaries of other German states.

The following table gives the area and population (1875) of the 12 Prussian provinces:

	Area in sq.m.	Pop. in 1875.
1. Prussia.....	24,116	3,200,484
2. Brandenburg.....	15,401	3,132,483
3. Pomerania.....	11,638	1,462,310
4. Posen.....	11,177	1,608,956
5. Silesia.....	15,558	3,851,960
6. Saxony.....	9,743	2,171,858
7. Sleswick-Holstein.....	7,224	1,074,812
8. Hanover.....	14,855	2,018,868
9. Westphalia.....	7,799	1,907,195
10. Hesse-Nassau.....	6,021	1,469,902
11. Rhenish Prussia.....	10,413	3,807,120
12. Hohenzollern.....	441	66,614
Total.....	134,376	25,772,561

The duchy of Lauenburg, with an area of 452 sq.m., and a population (1875) of 45,808, was incorporated with the province of Sleswick-Holstein in July, 1876, and is included in the estimate given.

In 1819 the total population of Prussia was 10,981,934. In 1858 it was 17,739,913. In 1867 the kingdom, increased from an area of 107,757 English sq.m. to its present size, had a population of 24,106,847. The census of Dec., 1871, gave a total of 24,689,252.

Physical Character, etc.—The larger portion of Prussia is a part of the great plain stretching from Holland to the Ural mountains, and, except in the s. of Hanover and Silesia, is an almost unbroken level. The Sudetic mountains, whose northern ranges, known as the Riesengebirge (q. v.), lie between the Oder and the Elbe, divide Prussia from Bohemia; while the Thüringerwald intersects the line dividing it from Saxony and some of the lesser German states. The Harz mountains (q. v.) of Hanover are now within the limits of Prussian territory. None of these ranges rise, even in their highest summits, above 5,000 feet. In the e. the surface of the great plain of Prussia is marked by two distinct tracts of more elevated land, one of which belongs to the elevation which, running generally parallel to the Baltic, may be traced from the mouth of the Elbe to the source of the Volga, and which in Prussia rises about 400 ft. above the sea-level. This tract is diversified with numerous lakes, none of which is more than 20 sq.m. in extent, but which altogether occupy an area of more than 300 sq. miles. The soil, consisting chiefly of loose sand interspersed with a large number of erratic blocks of granite, is sterile, covered in many places with heaths and belts of stunted pines. On the northern slope, terminating on the shores of the Baltic, there are several fertile districts, more especially along those rivers which have been carefully embanked, as the Niemen and the Vistula. The southern elevation of the Prussian plain, running between the Polish mountains of Sandomir in the s.e., and the Elbe between Magdeburg and Burg in the n.w., attains a height of about 1000 ft. near Breslau on the Oder, where it is known as the Trebnitz heights. Its general character is more fertile than the northern elevation; while the country between the two is, for the most part, extremely sterile. It includes the sandy waste in which Berlin, the capital, is situated. South of this tract, and in Silesia and Prussian Saxony, the country is fertile, including some of the most productive grain-growing districts of Prussia. Hanover has much the same character. Great marshes or peat-moors cover the n. and n.w. districts; but the valleys that lie among the Harz mountains in the s. are often fertile, and well adapted for agriculture. The coasts are low, and require to be protected from the overflowing of the sea by embankments and dikes. Sleswick-Holstein, the recently annexed territory n. of the Elbe, is in part sandy and heathy, like the plain of Hanover, but it has also numerous marshes. The great plain of northern Prussia is watered by five large rivers—the Weser, Elbe, Oder, Vistula, and Niemen; the numerous affluents of which, together with many smaller streams, con-

tribute largely to the facilities of intercourse throughout the country, as many of them are navigable for vessels of several hundred tons.

The western and south-western parts of Prussia, comprising Rhenish Prussia, Westphalia, and Hesse-Nassau, are quite distinct in their physical character from the rest of Prussia. They are divided by the Rhine into two portions, each of which has an elevated and a low plain. On the w. bank of the river, the level land terminates in the northern extremity of the Vosges, or, as they are here called, the Hardt, mountains, and extends northward as far as Aix-la-Chapelle. This table-land is broken along the banks of the Moselle by ranges of the Hochwald and the Soonwald, the highest summit of which, Walderbsenkopf, attains an elevation of about 2,700 feet. The plain n. of the Moselle, which is known as the Eifel and the Hohe Veen, has a mean elevation of 1600 ft., with a few higher hills. The level country between the Rhine and Maas, bordering the Eifel, is extremely fertile. On the e. side of the Rhine, the table-land, rising along the banks of that river and the Main, terminates in the ridge of the Taunus, whose highest summit, the Feldberg, attains a height of more than 2,800 feet. In the n., the plain ends in the Westerwald between the Lahn and the Sieg, and in the Sauerland between the Sieg and the Ruhr. The Teutoburgerwald and the Harz mountains cut off this region from the sandy and heathy wastes of northern Prussia. The soil is generally poor in these districts, which, however, possess special sources of wealth in their iron and coal mines. But Hesse-Cassel, which forms part of the central plateau of Germany, is particularly fruitful, cereals of all kinds growing abundantly.

The narrow valley of the Rhine is noted as one of the most picturesque and beautiful parts of Germany. The Rhine (q. v.) is navigable throughout its entire course in Prussia, which it traverses from s. to n., receiving numerous other rivers—as the Lahn, Wied, Sieg, Wupper, Ruhr, Lippe, Berkel, and Vechte on the right; and on the left, the Ahr and the Moselle, the latter of which is navigable for more than 150 m. within the Prussian dominions. The Weser, the Elbe, the Oder, and the Vistula, as also the Spree and the Havel, affluents of the Elbe, are of high importance for the inland navigation of Prussia, and are each discussed in special articles. The great rivers of north Germany are connected by an extensive system of canals, such as the Seckenburger, the Friedrichsgraben, the Finow, Bromberger, and Friedrich Wilhelms, and the Plauensche.

Climate, Products, &c.—The climate of Prussia presents great differences in the eastern and western provinces—the former being exposed to heavy snow-storms in the winter, and great droughts in the summer, and with a mean annual temperature of 43°, has a summer mean temperature of 61°, and winter, 23° Fahr.; while the latter, which have milder winters, and a larger fall of rain, have a mean annual temperature of 49°.5—summer, 63°, and winter, 35° Fahr.

Agriculture and the rearing of cattle constitute the principal sources of employment and wealth of the rural population of the entire monarchy, and the state has hitherto directed its unremitting attention to the furtherance of the one, and the improvement of the other; abrogating onerous land-taxes, advancing money to landowners, encouraging agricultural institutions, introducing approved breeds of animals, and improved farm implements, &c. About one-half, or 12,000,000, of the population of the kingdom are engaged in agriculture as their sole or chief occupation. Large estates, as a rule, are only to be found in the eastern and least populated provinces of the monarchy. A survey, taken in 1858, gave 1,099,000 landowners, possessing each less than 5 morgen, or 3½ acres. Wheat, rye, oats, barley, peas, millet, rape-seed, maize, linseed, tobacco, flax, hemp, hops, chicory, are extensively cultivated, and largely exported. The finest grain districts are the Börde, near Magdeburg, the low-lands on the Wartha and Netze, and on the Plöne and Müritze lakes, the north-eastern parts of Pomerania, the island of Rügen, the valleys of the Oder in Silesia, of the Saale, Moselle, Saar, and parts of Hesse-Nassau. Potatoes have of late years been largely grown. Western Prussia is noted for its excellent fruits and vegetables, and its provinces stand pre-eminent for their wines. Nassau is specially famous for its Rhine wines, Hochheimer, Johannisberg, Rudesheimer, and Asmannshäuser. The forest-lands, which are chiefly in East Prussia, Posen, Upper Silesia, Westphalia, Southern Hanover, and Hesse-Nassau, are of great value and considerable extent, occupying an area of 10,000,000 English acres. The mineral products of Prussia include coal, iron, lead, zinc, copper, cobalt, antimony, manganese, arsenic, sulphur, alum, nickel, black-lead, baryta, gypsum, slate, lime, freestone, salt, amber, agate, jasper, onyx, &c. All metals, salt, precious stones, and amber belong to the crown. The latter substance is found almost exclusively along the Prussian coast from Dantzic to Memel, where it is fished, dredged for, or dug up near the shore. Prussia has upward of 100 mineral springs, of which the most noted and efficient are the sulphur baths of Aix-la-Chapelle and Ems, the iron springs of Schwalbach, Wilhelmsbad, Driburg, and the hot and saline baths of Reinerz, Landeck, Flinsberg, Freienwalde, Lauchstedt, Wiesbaden, Schlangenbad, and Selters.

East Prussia is noted for its royal studs, and the excellent breed of horses which it now raises, and of which large numbers are annually exported. Westphalia enjoys a special reputation for the excellence of its hams and pork, Pomerania for its smoked geese, and Brandenburg and Hanover for honey and wax.

Fish of all sorts are abundant in the rivers and numerous lakes; seals are taken in the Baltic. The wooded districts abound in game of every kind; pheasants, partridges, and

wild-geese being often found in enormous quantities. Besides stags, fallow-deer, wild boars, foxes, otters, weasels, polecats, martens, badgers, hares, and rabbits, the lynx, bear, eagle, and beavers are occasionally met with.

Manufactures, Commerce.—The principal manufactures are linens, for which certain districts of Silesia, Prussian Saxony, and Brandenburg enjoy a European celebrity; while of late years, the cotton manufactories, worked by steam, have maintained a successful rivalry with the older linens, worked by hand-looms. Besides these, there are numerous manufactories of silk, wool, mixed cotton and linen fabrics; including fine-shawls and carpets in Brandenburg, stockings and ribbons in the Rhenish provinces, where, as well as in Westphalia and Hesse-Nassau, the flax, hemp, and silk and cotton thread is mainly prepared for the manufacturers. These districts, moreover, stand foremost in regard to the preparation and manufacture of iron, steel (the steel and gun works of Krupp, at Essen, being world-famous), and other metallic wares, paper, leather, soap, oil, cigars, and tobacco, and for the number of their distilleries and breweries; while Saxony and Silesia have the largest number of chicory, starch, beet-root, gunpowder, and glass works. Berlin and Elberfeld rank as the two most important centers of manufacture in the continent. The region of the Harz in Hanover is famous for its mining industries. In 1874 there were altogether in Prussia 2,525 mines, producing coal, lignite, and iron, zinc, lead, and copper ores, and employing 229,841 persons, the value of the produce being estimated at 143,200,842 thalers. In the same year the smelting-works and foundries amounted to 1074, employing 121,792 persons, the value of the produce being 194,798,375 thalers.

The commerce of Prussia is materially facilitated by her central European position, and the net-work of river and canal navigation, which makes her territories the connecting medium between several of the great European states, and which, with 11,000 m. of railway, 22,000 m. of public roads (all, or nearly all, formed since the time of Frederick the great), and a sea-line of 700 m. on the Baltic, and 200 on the German ocean, give her a free outlet to the rest of the world. The Prussian mercantile marine, in 1875, numbered 3,103 vessels, of 496,337 tons. The chief ports are Memel, Pillau, Königsberg, Dantzic, Colberg, Swinemünde, Stettin, Wolgast, Stralsund, Kiel, Flensburg, Altona, Harburg, Geestemünde, Leer, and Emden. The principal commercial towns are Berlin, Königsberg, Breslau, Barmen, Elberfeld, Dantzic, Stettin, Cologne, Magdeburg, Aix-la-Chapelle, and Frankfort-on-the-Main. Annual fairs are still held at Breslau, Magdeburg, and Frankfort-on-the-Oder.

The money, measures, and weights of Prussia are those in use throughout the German empire. In accordance with the law of 1872, the *mark* is the unit of reckoning, and has gradually displaced thalers (q. v.) and silbergroschen. The Prussian or Berlin bank, founded in 1765, with numerous branches in the provinces, is the most important of those banks which possess the right of issuing notes.

Religion, &c.—The dominant religion is Protestantism, and since 1817 the Lutheran and Reformed churches have been united under the head of one common evangelical church. Everything connected with the external administration of church matters is under the control of the minister of public instruction and ecclesiastical affairs, but every religious community manages its own internal concerns; the Protestant churches acting in conjunction with consistories or boards appointed by the government, one of which exists in each province, under the direction of the upper president, or provincial governor, and clerical superintendent generals, who, in Posen and Pomerania, bear the title of bishop, while the Roman Catholic church is directed by the two archbishops of Posen and Gnesen and Cologne, under whom stand the four bishoprics of Culm, Münster, Paderborn, and Treves. The two episcopal sees of Breslau and Ermeland are directly under the jurisdiction of the pope, while the district of Glatz, in Silesia, belongs to the archbishopric of Prague, and Katscher, in Upper Silesia, to that of Olmütz. The results of the census of 1871, as regards the numbers of the religious bodies, are as follows: the Protestants of Prussia numbered 16,041,215; the Roman Catholics, 8,268,309; other Christian sects, 53,993; Jews, 325,565. This gives a percentage of 64.96 of the population to Protestantism, and of 33.48 to Roman Catholicism, yet it is significant that the number of Roman Catholic clergy is nearly as great as that of the Protestant clergy. The higher Roman Catholic clergy are paid by the state, the archbishop of Breslau receiving £1700 a year, and the other bishops about £1135. The incomes of the parochial clergy of both sects arise mostly from endowments.

Education.—Education is compulsory in Prussia, and its management and direction are under the control of the state. In no country are better or ampler means supplied for the diffusion of knowledge among all classes of the community. Prussia has ten universities—viz., Königsberg, Berlin, Greifswald, Breslau, Halle, Göttingen, Münster, Bonn, Kiel, and Marburg, which, in June, 1875, numbered 881 professors and teachers, and 7,783 students. The Prussian schools are divided into eleven classes—viz., 1. *Elementary*, embracing village or town schools; 2. *Bürger* schools, or citizen schools; 3. *Real-schulen*, or schools in which arts, sciences, and languages are taught; 4. Seminaries, or schools for training elementary school-masters; 5. *Gymnasien*, or high-schools for classical education; 6. Industrial schools; 7. Schools of architecture; 8. Schools of mines; 9. Schools of agriculture; 10. Veterinary schools; and, 11. Universities. At the end of 1874, there were in Prussia 34,989 elementary schools, with 55,585 teachers and

3,993,323 pupils. The management of the elementary national schools is in the hands of the local communities; but the state appoints the teachers, and in part pays their salaries, the remainder being supplied by the public. In addition to the libraries of the several universities, there is the royal library at Berlin, with 700,000 volumes and about 15,000 MSS. Among the numerous scientific, artistic, and literary schools and societies of Prussia, the following are some of the more distinguished: the academy of arts, founded in 1699; the royal museum of arts; the academy of sciences; the natural history, geographical, and polytechnic societies of Berlin; the antiquarian society of Stettin; the Breslau natural history and historical societies, etc.

Justice.—The highest court of law is the upper tribunal in Berlin, and each province has its special court of appeal. Besides these there are 125 magisterial, 7 commercial, and numerous military courts. In the Cologne district, the *code Napoléon* is in force, and in Hither-Pomerania, the common German law; but in other parts of the kingdom the Prussian code (*Landrecht für die Preussischen Staaten*), compiled under Frederick the great's direction, and introduced in 1794, is followed. A new penal code was promulgated in 1850, by which all pre-existing seigniorial, municipal, or ecclesiastical rights of decreeing punishments were unconditionally abrogated. Members of the royal family are amenable to special laws and courts. Lesser courts for the settlement of minor debts and disputes, and juries, have been introduced in every province of late years, and publicity is demanded by the constitution in the conduct of criminal cases. The administration of military matters is under the control of the minister of war; military courts are presided over by two civil and three military officers, and are subordinate to the local provincial courts of appeal.

Army, Navy, etc.—In July, 1876, the strength of the Prussian army on a peace-footing, according to official returns, numbered 319,824, of whom 53,294 were cavalry and 26,690 artillery. On the war-footing, the numbers can be raised to 900,000. The army consists of the regular troops and the landwehr (q. v.), and in time of war an extra force can be called up under the title of the landsturm. Every able-bodied male Prussian is liable to be called upon to serve between 20 and 36 years of age (see GERMANY). Menonites (see ANABAPTISTS), clergymen of the Roman Catholic and Evangelical churches, and indispensable supporters of families are exempt. The time of active service is three years for some branches of the service and two for others. In peace, the army lies distributed over 309 garrison towns and 29 fortresses, of which latter the following are fortified places of the first rank: Mainz, Coblenz (with Ehrenbreitstein), Cologne, Königsberg, Magdeburg, Spandau, and Posen. Great care is bestowed on the education and military training of officers and men; and besides numerous admirable academies, there are several good schools of operative and veterinary surgery, etc., connected with the educational department of the army. The navy of the German empire is the navy of Prussia. See GERMANY.

Constitution, etc.—Prussia was an absolute monarchy till the crisis of 1848, when the decided movement in favor of liberal views compelled the late king to convoke a national assembly, and submit to the establishment of a constitutional form of government, which has been repeatedly modified. The national representative body consists of two bodies. 1. An upper chamber (*herrenhaus*, or "house of lords"), which is now composed of the princes of the royal family who are of age, the chiefs of the mediatised princely houses, recognized by the congress of Vienna, and numbering 16 in Prussia, the heads of the territorial nobility (about 50), life-peers chosen by the king from the class of rich land-owners, manufacturers, and "national celebrities," a titled representative chosen by all land-owners in each of the Prussian provinces, representatives of the universities, the burgomasters of all towns having more than 50,000 inhabitants, and an indefinite number of members appointed by the king for life or for a limited period. 2. A lower chamber (*abgeordnetenhaus*, or "chamber of deputies"), composed of 432 members, 352 for the old kingdom and 80 for the provinces annexed in 1867. Every Prussian who has attained his 25th year, and who has a municipal vote, has also a parliamentary vote, but not a direct one. Out of every 250 *wähler*, or electors in the first instance, is chosen a *wahlmann*, or direct elector. This is the man who, strictly speaking, votes for a member of parliament. Representatives are elected for three years. In addition to this general house of assembly, there are representative bodies for the provinces, communes, and circles, which debate and legislate in regard to local matters within their several departments. The council of state is composed of 8 ministers, under whose ministries are numerous departments, embracing almost every conceivable subdivision of foreign policy or internal legislation, since nothing can be done in Prussia independently of the state. By the modified constitution of 1850, all exclusive privileges arising from titles or station are abrogated, and perfect equality in the eye of the law fully recognized; liberty of the subject guaranteed in regard to religious persuasion, the right to hold meetings, unarmed, within closed doors, and become members of societies; immunity from domiciliary visits, and inviolability of letters, etc. The monarchy is hereditary in the male line. The sovereign and royal family must profess the evangelical confession of faith. The king, who is not responsible for the measures of his government, and whose decrees require the counter-signatures of his ministers, exercises the executive power, nominates and dismisses the ministry, summons and dissolves the chambers, orders the promulgation of the laws, is commander-in-chief of the forces, has

the right of proclaiming peace and war, granting reprieves, etc. He bears the titles of king of Prussia, markgraf of Brundenburg, sovereign-duke of Silesia, prince of Orange, grand-duke of Pomerania and the Lower Rhine, beside a host of lesser titles. The title "emperor of Germany," by which he is now best known, is not, of course, a Prussian dignity. The arms of Prussia are composed of four central shields, borne on the great shield of 48 fields, representing the different territories incorporated in the Prussian monarchy. The black eagle on a field argent, surmounted by the open crown, is the special cognizance of Prussia proper. The national colors are black and white; the standard is white, bearing the Prussian crowned eagle and an iron cross in the right corner. The eldest son of the king bears the title of crown-prince. The ordinary royal residences are the palaces at Berlin, Potsdam, and Charlottenburg. The royal domains were ceded to the state by Frederick-William III. in 1820, on condition of a rental of 2½ millions thalers being paid first from them for the king and his family, which, however, has been largely increased of late years by means of a *kronotation* ("crown-allowance"). Among the numerous military orders, the following deserve notice: The order of the swan, founded in 1443, and that of the black eagle, founded in 1701, regarded as of the highest dignity.

According to the budget estimate for 1877-78, the receipts and expenditure for that year were calculated at 651,638,414 marks, or £32,581,920; while the funded national debt in April, 1877, in addition to debts for railways, etc., amounted to 1,053,550,472 marks, or £52,927,523.

Population, Races.—About seven-eighths of the population of Prussia are Germans. Of the Slavonic tribes, the most numerous are Poles, numbering 2½ millions. In Brandenburg and Silesia, there are about 83,000 Wends; in East Prussia, upward of 146,000 Lithuanians; Western Prussia has rather more than 10,000 Walloons, using the French language; intermixed in its generally German population, Silesia has 50,000 Czechs, or Bohemians; Sleswick-Holstein, 150,000 Danes—making in all about 3,000,000 who do not use the German language, or who employ it only as secondary to their native tongues.

Ranks, Classes.—Three distinct hereditary classes are recognized in Prussia, viz., nobles, burghers, and peasants. To the first belong nearly 200,000 persons, including the higher officials of the state, although that number does not comprise the various mediatized houses, of which 16 are Prussian, and others belonging to different states, but connected with Prussia by still existing, or former territorial possessions. The burgher class includes, in its higher branches, all public office-bearers, professional men, artists, and merchants; while the peasantry—to which belong all persons engaged in agricultural pursuits—are divided into classes, depending on the number of horses employed on the land, etc.

History.—The lands bounded by the Baltic, which now form part of Prussia, were early occupied by Slavonic tribes, nearly allied to the Letts and Lithuanians. It is conjectured that they were visited by Phœnician navigators in the 4th c. B. C.; but beyond the fact of their having come into temporary conflict with the Goths and other Teutonic hordes, prior to the great exodus of the latter from their northern homes, little is known of the people till the 10th c., when they first appear in history under the name of Borussi or Prussians. In 997 bishop Adalbert of Prague suffered martyrdom at their hands, while endeavoring to convert the people to Christianity. Boleslas duke of Poland succeeded, however, about 1018, in compelling them to submit to baptism and subjection. After many futile attempts on the part of the people to throw off the yoke of Christianity and foreign domination, they finally made a successful stand against Boleslas IV. of Poland in 1161, and for a time maintained a rude and savage kind of independence, which the disturbed condition of Poland prevented its rulers from breaking down. The fear of losing their freedom if they adopted Christianity, made the Prussians obstinately resist every effort for their conversion; and it was not till the middle of the 13th c., when the knights of the Teutonic order entered upon their "famous" crusade against them, that the Christian faith was formally established among them. The aggressive inroads of the pagan Prussians on the territories of their Christian neighbors, and their advance into Pomerania, were the exciting causes of this important movement. The knights of the order, when appealed to by Conrad duke of Masovia to aid in the subjection of the heathen, gladly promised their services, on condition of being permitted to retain possession of the lands which they might conquer; and having entered the Prussian territories in considerable numbers, they entrenched themselves at Vogel-sang and Nesson in 1230, and at once entered upon the conquest of Prussia. For half a century the belligerent brotherhood were engaged in war with the people—winning lands and souls by hard fighting—until at length, in 1283, they found themselves undisputed masters of the country, which they had both civilized and Christianized after a fashion, namely, by almost exterminating the pagan population. During this period of struggle, the knights founded the cities of Thorn, Kuhl, Marienwerder, Memel, and Königsberg, repopled the country with German colonists, encouraged agriculture and trade, and laid the foundation of a well-ordered, prosperous state. The unhappy wars between the knights and the Poles and Lithuanians, together with the moral degeneracy of the order, led, in the 14th and 15th centuries, to the gradual decline of their supremacy. In 1454 the municipal and noble classes, with the co-operation of Poland, rose in open rebellion against the knights, who were finally compelled to seek peace at any

cost, and obliged, in 1466, to accept the terms offered to them by the treaty of Thorn, by which West Prussia and Ermland were ceded by them unconditionally to Poland, and the remainder of their territories declared to be fiefs of that kingdom. In 1511 the knights elected as their grand-master the markgraf Albert of Anspach and Baireuth, a kinsman of the king of Poland, and a cion of the Frankish line of the Hohenzollern family. Although his election did not immediately result, as the knights had hoped, in securing them allies powerful enough to aid them in emancipating themselves from Polish domination, it was fraught with important consequences to Germany at large, no less than to the order itself. In 1525 the grand-master was acknowledged duke of Prussia, which was converted into a secular duchy (afterward known as East Prussia), and renounced the Roman Catholic religion for Lutheranism, his example being followed by many of the knights. The country made rapid advances under the rule of Albert, who improved the mode of administering the law, restored some order to the finances of the state, established schools, founded the university of Königsberg (1544), and caused the Bible to be translated into Polish, and several books of instruction to be printed in German, Polish, and Lithuanian. His son and successor, Albert Frederick, having become insane, a regency was appointed. Several of his kinsmen in turn enjoyed the dignity of regent, and finally his son-in-law, Johann Sigismund, elector of Brandenburg, after having held the administration of affairs in his hands for some years, was, on the death of the duke in 1618, recognized as his successor, both by the people and by the king of Poland, from whom he received the investiture of the duchy of Prussia; which, since that period, has been governed by the Hohenzollern-Brandenburg house.

Here it will be necessary to retrace our steps in order briefly to consider the political and dynastic relations of the other parts of the Prussian state. In the 12th c. the northern mark, comprising probably the territory between the Elbe and the Oder, as far as its confluence with the Spree, was held by the immediate descendants of Albert the bear of Luxemburg, its first hereditary markgraf, who, during the next two or three centuries, extended their dominions eastward, beyond the Oder into Further Pomerania. On the extinction of this line, known as the Ascanian house, a remote kinsman, Frederick VI., count of Hohenzollern, and markgraf of Nürnberg, became possessed, partly by purchase and partly by investiture from the emperor, of the Brandenburg lands, which, in his favor, were constituted into an electorate. This prince, known as the elector Frederick I., received his investiture in 1417. He united under his rule, in addition to his hereditary Franconian lands of Anspach and Baireuth, a territory of more than 11,000 sq. miles. His reign was disturbed by the insubordination of the nobles, and the constant incursions of his Prussian and Polish neighbors, but by his firmness and resolution he restored order at home and enlarged his boundaries. Under Frederick's successors the Brandenburg territory was augmented by the addition of many new acquisitions, although the system of granting appanages to the younger members of the reigning house, common at that time, deprived the electorate of some of its original domains, as for instance the markgrafate of Anspach, which passed, on the death of the elector Albert Achilles in 1486, as an independent state to his younger sons and their descendants. The most considerable addition to the electorate was the one to which reference has already been made, and which fell to the elector John Sigismund through his marriage in 1609 with Anne, daughter and heiress of Albert Frederick the insane, duke of Prussia. In consequence of this alliance, the duchy of Cleves, the countships of Ravensberg, the Mark, and Limburg, and the extensive duchy of Prussia, now known as East Prussia, became incorporated with the Brandenburg territories, which were thus more than doubled in area. The reign of John Sigismund's successor, Georg-Wilhelm (1619-40), was distracted by the miseries of the thirty years' war, and the country was alternately the prey of the Swedish and imperial armies; and on the accession of Georg-Wilhelm's son, the great elector Frederick-William (q.v.), in 1640, the electorate was sunk in the lowest depths of social misery and financial embarrassment. But so wise, prudent, and vigorous was the government of this prince, that at his death in 1688 he left a well-filled exchequer, and a fairly equipped army of 38,000 men; while the electorate, which now possessed a population of one and a half million, and an area of 42,000 sq.m., had been raised by his genius to the rank of a great European power. His successors, Frederick III. (q.v.) (1688-1713), and Frederick-William I. (1713-40), each in his own way increased the power and credit of Prussia, which had been in 1701 raised to the rank of a kingdom. The latter monarch was distinguished for his rigid economy of the public money and an extraordinary penchant for tall soldiers, and left to his son, the great Frederick II. (q.v.), a compact and prosperous state, a well-disciplined army, and a sum of nearly nine million thalers in his treasury. Frederick II. (1740-86) dexterously availed himself of the extraordinary advantages of his position to raise Prussia to the rank of one of the greatest political powers of Europe. In the intervals between his great wars, he devoted all his energies to the improvement of the state, by encouraging agriculture, trade, and commerce, and reorganizing the military, financial, and judicial departments of the state. By his liberal views in regard to religion, science, and government, he inaugurated a system whose results reacted on the whole of Europe; and in Germany, more especially, he gave a new stimulus to thought, and roused the dormant patriotism of the people. Frederick was not over-scrupulous in his means of enlarging his dominions, as he proved by sharing in the first

partition of Poland in 1772, when he obtained as his portion nearly all west Prussia, and several other districts in east Prussia. His nephew and successor, Frederick-William II. (1786-97), aggrandized his kingdom by the second and third partitions of Poland in 1793 and 1795. Frederick-William III. (q.v.), (1797-1840), who had been educated under the direction of his grand-uncle, Frederick the great, succeeded his father in 1797, at a time of extreme difficulty, when continental rulers had no choice beyond being the opponents, the tools, or the victims of French republican ambition. By endeavoring to maintain a neutral attitude, Prussia lost her political importance, and gained no real friends, but many covert enemies. But the calamities which this line of policy brought upon Prussia roused Frederick-William from his apathy, and with energy, perseverance, and self-denial worthy of all praise, he devoted himself, with his minister count Hardenberg, to the reorganization of the state. In the ten years which succeeded the battle of Waterloo, Prussia underwent a complete reorganization. Trade received a new impulse through the various commercial treaties made with the maritime nations of the world, the formation of excellent roads, the establishment of steam and sailing packets on the great rivers, and at a later period the organization of the customs-treaty, known as the Zollverein (q.v.), between Prussia and the other states of northern Germany, and through the formation of an extended net-work of railways. The most ample and liberal provision was made for the diffusion of education over every part of the kingdom, and to every class, in like manner, the established Protestant church was enriched by the newly inaugurated system of government supervision, churches were built, the emoluments of the clergy were raised, and their dwellings improved; but not content with that, the king wished to legislate for the church in accordance with a set plan; and when the various Protestant churches refused to be joined in the union prescribed for them, difficulties arose. This tendency to over-legislation has long been the predominating evil feature of Prussian administration; and the state, without regard to the incongruous elements of which it was composed, was divided and subdivided into governmental departments, which, in their turn, under some head or other, brought every individual act under governmental supervision, to the utter annihilation of political independence. The people, when they gradually began to comprehend the nature of this administrative machinery, saw that it made no provision for political and civil liberty, and demanded of the king the fulfillment of the promise he had given in 1815 of establishing a representative constitution for the whole kingdom. This demand was not acceded to by the king, and its immediate fruits were strenuous efforts on his part to check the spirit of liberalism. Every measure taken by other sovereigns to put down political movements was vigorously abetted by him. Siding with the pietists of Germany, he introduced a sort of Jesuitical despotism, which was continued by his successor, Frederick-William IV. The Landstände or provincial estates, organized in accordance with the system of the middle ages, were the sole and inadequate mode of representation granted to Prussia in this reign, notwithstanding the pledge made to the nation for a full and general representative government. An attempt made forcibly to unite Lutheran and reformed churches excited universal indignation, while the imprisonment, at a later period, of the archbishops of Cologne and Gnesen for their conduct in regard to the vexed question of mixed marriages, involved the king in a long and fruitless dispute with the pope. The accession of Frederick-William IV. in 1840 seemed to open a better prospect to the friends of constitutional freedom, but the reality was scarcely equal to the expectations which had been warranted by the professions of the government. Still, new hopes and requirements had been excited, and a new life was infused into every department of the state. Every branch of science, art, and literature was understood to receive the attentive consideration of the sovereign, who professed to be (and, doubtless, in a sort of way, was) actuated by a love of universal progress. He made similar professions in regard to religious toleration, but the pietistic tendencies of his government exerted a forced and prejudicial influence in every department of the state; while the bureaucratic spirit of over-governing which characterized the administration was becoming daily more and more irksome to the nation, and gave rise to the formation of free churches or Protestant communities; while a contemporaneous excitement which had arisen in the Roman Catholic church of Prussia, as the result of the schismatic movement due to the stand taken by the chaplain Ronge (q.v.) on the exhibition of the so-called holy coat of Treves (q.v.), further complicated the relations between church and state. The king and his advisers, underrating the importance of the movement of 1848 in Germany, thought they had satisfied the requirements of the hour by granting a few unimportant reforms, and making equivocal promises of further concessions. When at length, however, the citizens and troops came into collision, and blood was shed, Frederick-William came forward as the professed regenerator of his country, offering to lay down his royal title and merge his kingdom in the common fatherland, for the salvation of which he recommended a cordial union of all German princes and people in one bond, and proposing himself as the guide and leader of this new Germany. His own subjects, and many Germans in other states, hailed with delight professions which seemed to give a living embodiment to the national desire for unity. The publication of a political amnesty, the nomination of a liberal ministry, the recognition of a civic guard, the retirement of the prince of Prussia, the heir-presumptive—with whom every arbitrary measure of government was believed to originate—and the summons of a representative chamber to discuss the proposed constitution—all tended to

ally the general discontent. It might have been well if the German states and the German democracy had resolved at this time to accept the leadership of Prussia, but the so-called national assembly at Frankfort declined to do this, and elected the archduke John of Austria lieut. gen. of Germany. A feeling of deep chagrin on the part of the Prussian king was the result of that extremely unwise and unpatriotic act, dictated by a fear of Prussian military strength, and oblivious of the fact that Prussia, in spite of its despotic government, was the country most thoroughly penetrated by Germanic ideas. His ardor in the cause of the fatherland cooled, his pledges to his own subjects remained unfulfilled as long and as completely as the occasion permitted, and his policy became more strongly tinged than before with a jealousy of Austria. His powerful co-operation in putting down the insurrection in Poland, and the democratic party in Baden, gave, however, ample proof of his determined opposition to every popular demonstration against absolutism. In the first war of the Sleswick-Holstein duchies, the Prussians acted in concert with the disaffected against their sovereign, the king of Denmark, occupying the dual provinces in the name and on the behalf of the diet. The latter years of this reign were characterized by great advance in the material prosperity and internal improvement of the country. Extensive lines of railway and post-roads were opened, the river navigation greatly facilitated, treaties of commerce formed with foreign countries, and great expansion given to the Prussian and north German zollverein (q. v.), the army put upon a footing of hitherto unprecedented efficiency of arms and artillery, and the educational system of the country still further developed. The political freedom of Prussia did not, however, make equal advance. The chambers which met for the discussion and framing of a constitutional mode of government, were constantly interrupted and obstructed in the prosecution of their task, and the constitution was modified every year between 1850 and 1857, until it retained few of its original bases. Wilhelm I., who succeeded his brother in 1861, and in 1871 became German emperor, was no more a lover of constitutional, or at least of popular, liberty, than any of his predecessors; and for some years he strove hard to check the progress of the popular movement, in so far as it aimed at interference with the absoluteness of the regal power, and he repeatedly rejected measures of reform recommended by the Prussian chamber of deputies; but, on the other hand, it must be allowed that he has shown himself zealous for the honor and greatness of Germany above all other princes of the empire; and the exigences of the great war with France (1870-71) have compelled the Prussian government to bring itself into closer relations with popular feeling, though constitutional freedom is still far from being fully enjoyed. For the later history of Prussia, both military and political, see GERMANY, also GERMANY in SLESWICK-HOLSTEIN; and BISMARCK.

PRUSSIA, one of the eleven provinces into which the kingdom of the same name is divided, is bounded on the s. w. by Pomerania and the Baltic sea, and on the e. and s. by Russia and Poland. Area, 24,115 sq. m.; pop. '75, 3,200,484. It is divided into two districts or sub-provinces—e. Prussia and w. Prussia, of which the former is considerably the larger. About two-thirds of the soil consists of good land, the remainder being chiefly sandy. Agriculture is by far the most important branch of industry, manufactures being confined to such articles as supply merely local wants. Wheat is extensively cultivated, especially in the district of Gumbinnen; and, as the inhabitants live chiefly upon rye, the larger half of the wheat grown is exported. Prussia possesses a larger number of horses than any other province in the kingdom. For the history of the province of Prussia, and for its principal physical features, see PRUSSIA, KINGDOM OF.

PRUSSIAN BLUE. See BLUE, CYANOGEN, FERRO-CYANOGEN, and FERRID-CYANOGEN.

PRUSSIC ACID. See HYDROCYANIC ACID.

PRUTH, an important affluent of the Danube, rises in the s. e. of the Austrian crown-land of Galicia, on the n. e. side of the Carpathian mountains, and near the base of mount Rusky in that range. It flows in a deep valley eastward past Kolomea and Czernowitz, and from the point at which it leaves Austrian territory to its embouchure in the Danube at Reni, 12 m. below Galatz, it forms again, as it used to do before 1856, the boundary between the Russian province of Bessarabia and Rumania. Length about 500 miles. Swift in its upper course, the Pruth becomes navigable near Jassy. Its affluents are numerous, but inconsiderable.

PRYNNE, WILLIAM, noted as a pamphleteer and active politician during the reign of Charles I., and the subsequent period of the commonwealth, was born near Bath in the year 1600. He received his early education there, and was afterward transferred to Oriel college, Oxford, where, in 1620, he took his bachelor's degree. Selecting the law as his profession, he entered himself at Lincoln's inn, where he became a bencher and reader; but it does not appear that he ever very seriously endeavored to obtain practice at the bar. He was early drawn into the vortex of ecclesiastical controversy, and speedily made himself heard of as a champion of the puritan party. In 1632 appeared his *Histrionastix, or a Scourge for Stage-Players*, a tasteless and scurrilous attack on the popular amusements of the period, which procured him the attention of the authorities. For this performance he underwent prosecution in the star chamber, with results sufficiently unpleasant. His sentence involved him in a fine of £3,000, degradation from the bar, expulsion from Oxford and Lincoln's inn, the loss of both his ears in the pillory, and the

shock to his vanity as an author of seeing his book burned in public by the hangman. He was, moreover, condemned to perpetual imprisonment, and immured in the tower accordingly. If the severity of the punishment seems, at first sight, astounding in its disproportion to the nature and amount of the offense, it is perhaps sufficiently explained by the fact that Prynne, by his previous issue of a series of anti-prelatical tracts, as by other indications of hostility, had made himself most obnoxious to archbishop Laud and the clergy. Three years after, the pertinacious offender found means to publish from his prison another pamphlet, in which he fiercely attacked the hierarchy, and was unsparing in his personal abuse of Laud and certain other bishops. For this he was again prosecuted; a fine of £5,000 was imposed upon him; he was once more pilloried, losing such stumps of ears as the executioner had before spared; and was branded on both cheeks with the letters S. L. (seditious libeler). He was then removed to Caernarvon castle, and afterward to that of Mont Orgueil, Jersey, where he remained a close prisoner, till, in 1641—the long parliament then sitting—he was released by a warrant of the house of commons, and a tumultuous expression of popular sympathy celebrated his restoration to liberty. Shortly afterward he was sent to parliament as member for Newport, in Cornwall, and for some years was actively, and at times even prominently engaged on the popular side in the proceedings of the house of commons. In the extreme measures, however, leading to the deposition and death of the king, he declined all share; and being one of those of whom Cromwell shortly after “purged” the house of commons, he proceeded to assail him in print with an asperity not inferior to that with which he had before made war upon the bishops, as a consequence of which imprudence he was once more subjected to several years' imprisonment. On Cromwell's death he returned to his place in parliament, zealously interesting himself in the royal cause; and after the restoration, the office was bestowed on him of keeper of the records in the tower. Subsequently his inveterate habit of venomous pamphleteering involved him in difficulties with the house of commons, from which, on a charge of seditious libel, he narrowly escaped expulsion. He died at Lincoln's inn in Oct., 1669. The continuous stream of writings on the perilous topics of the day, which brought him so constantly into trouble, represents but a fraction of Prynne's literary activity. He busied himself chiefly as a compiler of matter illustrative of constitutional and parliamentary history. His most valuable works in this field are the *Calendar of Parliamentary Writs*, and his *Records*, both of which contain much that is useful and important.

PRYOR, ROGER A., b. Va., 1828; son of a prominent clergyman; educated for the profession of law. In 1850 he edited the *Southside Democrat* at Petersburg, Va.; in 1852-63 was attached to the staff of the Washington (D. C.) *Union*. In 1854 he had a diplomatic appointment to Greece, but in the following year returned to Petersburg and resumed the editorial chair. He also edited the Richmond (Va.) *South*, and the Washington *States*, extreme southern journals. In 1859 he went to congress, where he made himself notorious by advocating secession, and by challenging John F. Potter, of Wisconsin, to fight a duel. At the very beginning of the rebellion Mr. Pryor attached himself to the fortunes of the seceding states, and became a volunteer aid-de-camp to gen. Beauregard when the latter was investing fort Sumter. He rose to be a brig. gen. in the confederate army, and commanded a division in the battles before Richmond, but resigned Aug. 26, 1863. He was a member of the confederate congress, and in 1864 was captured by the federals, and was for a while imprisoned in fort Lafayette. After the war he was for a time an editor in Tennessee, but removed to New York and began practice at the bar. He was one of the counsel employed in the celebrated Beecher trial.

PRZE MYSL, a t. of the Austrian empire, in the province of Easter Galicia, on the right bank of the San, an affluent of the Vistula, 53 m. w. from Lemberg. It is connected by railway with Cracow, and so with the w. and n. of Germany on the one hand, and with Lemberg on the other. Przemysl is a flourishing town, carried on a considerable trade, and has manufactures of linens and leather. Pop. '69, 15,400.

PRZI BRAM, a t. of the Austrian empire, in Bohemia, 33 m. s. s. w. from Prague, on the Litawka, a feeder of the Moldau. It derives its importance chiefly from extensive lead and silver mines in the neighborhood, and is the seat of a superior court of mines. Pop. '69, 9,299.

PSALMANAZAR, GEORGE, a somewhat remarkable impostor, was born about the year 1680. His real name and the place of his birth are unknown, but he is presumed to have been a native of Switzerland or the s. of France. He received a good education, and gave early indication of talent, more especially for the acquisition of languages. Impelled by a restless and impatient temper, which indisposed him to any regular pursuit, for some years he roamed over Europe as a mere vagabond adventurer, assuming at first the disguise of an Irish pilgrim, exiled on account of his religion; and afterward as soldier, menial, preceptor, beggar, or vagrant nondescript, living on his wits as he could, according to the whim or necessity of the hour. In the course of his wanderings he was thrown into contact with a col. Lauder, commanding a Scotch regiment at Sluys, on whom he first passed the imposture to which he subsequently owed his notoriety, assuming the name by which he is since known, and representing himself as a Japanese convert to Christianity and native of the island Formosa. The good col. seems to have been completely deceived by him; not so, however, the chaplain of the regiment, one Innes, a

man equally acute and unprincipled, who speedily detected the deception, but was not the less willing to use it for the furtherance of his own ends. By Innes, Psalmanazar was brought to England, and instantly became the religious lion of the day, his patron skillfully availing himself of the connection to secure for himself preferment in the church. Dignitaries of the church contended for the honor of being serviceable to him; and through the influence of the bishop of Oxford, apartments were assigned him at the university, in order that he might prosecute his studies there. The talent, ingenuity, and resource which he displayed in keeping up the deception, go far to account for what may seem to us the strange credulity with which his story was received. He published, in Latin, a fabulous account of the island Formosa, the consistency and verisimilitude of which imposed upon the learned world. He also invented a language, compact and somewhat complex in structure; and was able, in virtue of a memory not less than astonishing, to defy the ordinary methods of detection. In the midst of his success, however, at the age of about 32, he became the subject of religious impressions, and his conscience awoke to the ignominy of the deceit which he was practicing. Urged by what seems to have been a genuine feeling of penitence, he withdrew himself from public notice, and for the rest of his long life honorably earned his livelihood by literature, in which he had a moderate success. Besides much assiduous compilation for the book-sellers, of history, geography, and the like, he published several works anonymously, one of which, *An Essay on Miracles, by a Layman*, was for some time exceedingly popular. On his death in London, in 1762, it was found that he had also busied himself in preparing for posthumous publication an account of his curious career, which, under the title *Memoirs of —, commonly known as George Psalmanazar, a reputed native of Formosa, written by himself*, was some years after given to the world.

PSALMODY, in its widest sense, is the singing of the Psalms of David and other sacred songs; but from the beginning of the reformation period, the term has been restricted to the singing of metrical versions of the Psalms to short simple airs. Psalm-singing was of ancient date among the Jews, and was practiced from the first ages of Christianity; the charge of Pliny the younger against the Christians was, that they sang Psalms to Christ "*quasi Deo.*" No authentic record, however, exists of the kind of melodies sung to the psalms by the primitive Christians. The practice of singing psalms in a strophon, or by two choirs, as still practiced (see ANTIPHONY), was introduced at an early period; it is said to have been begun in the eastern church by Ignatius, bishop of Antioch, in the 2d c.; and in the western church by Ambrose, bishop of Milan, in the 4th century. At first the whole congregation, clergy and laity, joined in the psalm; but difficulties and abuses arose from the growing neglect of musical cultivation; and, with a view of restoring public decency and order, the council of Laodicea, in the year 363, considered it necessary to forbid the laity to sing in church at all, except in certain simple chants of a popular description. Down to the reformation, the music of the church was surrendered to the clergy and trained musicians.

Psalmody, in the more modern sense, began in the 16th c., when Clement Marot, the court-poet of Francis I. of France, translated 52 of the psalms into French verse, dedicating them both to his royal master—whom he likened to the Hebrew psalmist—and to the ladies of France. The sacred song-book, on its first appearance, not being accompanied by music, it became the practice to sing the psalms to favorite tunes—often those of popular ballads, and for a considerable time psalm-singing became a favorite fashion among the gay courtiers of Francis. Marot's collection was continued and concluded by Theodore Beza, whose psalms had the advantage of being set to music, Beza having in this the assistance of Calvin, who engaged the best composers of the day to unite his sacred songs with beautiful and simple airs of a devotional character. Psalm-singing was taken up by the reformers, first for private devotion, and soon as part of the service of the church, Luther and Calvin restoring to the people their share in the musical part of public worship, and furnishing them with the means of performing it. From the time that psalm-singing was adopted by the reformers, it was discountenanced by the Roman Catholics, and soon came to be regarded as a badge of Protestantism. Luther and Calvin differed, however, in their ideal of psalmody: the former was favorable to harmony in parts, while the latter confined himself to the bare unaccompanied melody. Once taken up by the Calvinists and Lutherans, psalmody spread over France, Germany, and the Low Countries, and reached England at the moment of her embracing the reformation. The first English metrical version of the Psalms was made in the reign of Henry VIII. by Thomas Sternhold, a native of Hampshire, groom of the robes to king Henry, aided by John Hopkins and William Whytinghame. Vocal psalmody was soon after introduced into the church-service, the choral mode of singing being still retained in cathedrals and collegiate churches, and the liturgic hymns being retained in the prayer-book. Of the psalm-tunes which came into use, some have been attributed to Claude Goudimel, Claude le Jeune, and Guillaume Franc, and a few owe their origin to Luther. The well-known 100th psalm is an adaptation of Gregorian phrases by Guillaume Franc. The first important collection of psalm-tunes for four voices published in England was made by Thomas Ravenscroft, Mus. Bac., and appeared in 1621; it was entitled "*The whole Booke of Psalms, etc., composed into four parts by sundry authors, to such several tunes as have been and are usually sung in England, Scotland, Wales,*

Germany, Italy, France, and the Netherlands." In this collection were included contributions by Tallis, Morley, Dowland, and all the great masters of the day, as well as by Ravenscroft himself, who contributed the tunes St. David's, Bangor, and Canterbury. The name of John Milton, father of the poet, appears as composer of the tunes, York and Norwich. According to the then prevalent usage, the subject of air was given to the tenor voice. This custom was first departed from in the *Whole Book of Psalms, in Three Parts*, published in 1671, compiled and arranged by John Playford—whom sir J. Hawkins calls the "father of modern psalmody"—where we have the more proper practice, which has since obtained, of making the melody the soprano part. Croft, Courteville, Cary, the Bachs, and Handel have, since that time, contributed to the psalmody in use in Britain.

Among other metrical versions of the Psalms produced was one of doubtful origin which was attributed to James I.; and which, notwithstanding a strong recommendation by his son, was never much used in churches. The version of the Psalms by Sternhold and Hopkins came to be supplanted in England, toward the beginning of the last c., by that of Nahum Tate, poet laureate under William III. and Anne, and Dr. Nicholas Brady, less literal in its renderings than its predecessor, and somewhat commonplace as regards poetical character. This *New Version of the Psalms* first appeared in 1698, with the royal authority allowing its use in churches. Of late years modern hymns, selected according to the taste and at the will of the incumbent, have to a large extent taken the place of metrical psalms in the church of England.

In Scotland the early reformers paid great attention to singing. In John Knox's Psalter, arranged for use in churches, the metrical psalms are set to music in harmony of four parts. Several early translations of the Psalms were produced in n. Britain, but that of Sternhold and Hopkins was used in worship from 1564 down to the middle of the 17th century. In 1632, an attempt made by Charles I. to supersede it by king James's version, was more resolutely and decidedly opposed than in England. The version now in use in Scotland was introduced during the commonwealth by the general assembly, and founded on the metrical translation of Francis Rous, a member of Cromwell's council. This new version was in 1649 appointed by the general assembly to be the only paraphrase of the Psalms sung in the kirk of Scotland. About the beginning of the 18th c., an agitation began for the enlarging of the psalmody of the kirk, by adding to it paraphrases of other portions of scripture. A collection of such paraphrases was published in 1745, and was widely used. In 1775 a committee was appointed to revise it; and in 1781 the collection which has been so long in use was sanctioned by a *permissive* act of assembly. In addition to these, separate hymn-books are now sanctioned in the established and free churches of Scotland, and have long aided in the worship of the U. P. church.

PSALMS (Heb. *Tehillim*, Songs of Praise, or *Tefilloth*, Prayers; Jerome, *Liber Hymnorum*), the well-known canonical book generally ascribed to David. The single hymns contained in the book are variously designated either as "Prayer" (Tefilla), as "Praise" (Tehillah), or from some special characteristic. "Song" (Shir), or a song of deeper meaning, (Michtam), "Instruction" (Maskil), or a dithyrambic poem (Shigayon). Respecting the general contents of the book, it may be said that it comprises, in the form of pious lyrics, written for and on behalf of the congregation, the quintessence of the dogmatical, ethical, historical, and theocratical portions of the Old Testament. The divine essence and qualities, providence and its guidance—especially of Israel—the rule of the universe, the nature of the human heart and its relations to God and his revelation, the blessings of the theocratic community: these and similar reflections form the themes of its ever-varying modes. A certain more spiritual conception of the ordinances of the Pentateuch is visible throughout, and although the strictest adherence to these is enjoined, yet their deeper meaning is impressed more strongly still. Used as a liturgical hymn-book in the temple, it has been bodily received for the same purpose in the Christian church; and certain additional hymns which occur in the Greek and Syriac Psalter have not been sanctioned by the authority of the general church. There are, in all, 150 canonical hymns or psalms, which, after the model of the Pentateuch, have been divided into five books—thus: i.—xli.; xlii.—lxxii.; lxxiii.—lxxxix.; xc.—cvi.; and cvii.—cl. The Syriac, the LXX., and the Vulgate versions differ in some respects in their counting. The authorized version, however, follows strictly the Masoretic Jewish text, except with regard to the numbering of the verses; for while the latter includes the superscriptions among the verses, the former does not reckon those. This division into five books is as it is traditional, also the most natural; and the doxologies at the ends of psalms xli., lxxii., lxxxix., and cvi., further mark authoritatively the respective ends of the special divisions. A further division, or rather classification, has been attempted according to the contents; but, considering the constantly changing variety of moods and sentiments of manner and contents which these songs exhibit, it is a most precarious one.

The Psalms have generally—thirty-four only excepted—superscriptions more or less expressive of the contents of the special hymn, and sometimes with, sometimes without, the name of an author. In some, certain notes, referring to the musical and liturgical part, are added, which are far from being quite clear now, e.g., "On the octave," "For the chief musician," "On Machalath" (illness?), "In the time of death to the son," "The

hind of Aurora," "Lilies," "Dumb dove of the far ones," etc. One of the greatest puzzles is the word *Selah*, which occurs several times at the end, or in the middle of some psalms, and which the LXX. render *Diapsalma*, "Interlude," but about the real signification of which, numerous yet very unsatisfactory suggestions have been made at various times. Thus, it has been identified with *amen*, *hallelujah*, *piano*, etc. So much seems certain, that it was a kind of catchword or sign for the performers. These headings belong very probably to the individual poets themselves, and not to the collectors, as has been surmised.

The authorship of the Psalms is ascribed by the headings of the various chapters as follows: Psalm xc.—one of the most ancient in form and contents—is attributed to "Moses, the man of God." Seventy-three psalms are inscribed with David's name; two with Solomon's; twelve with that of Asaph, the Levite and singer, of which five, however, belong to the times of Jehoshaphat, Hezekiah, and the beginning of the Babylonian exile respectively. Eleven psalms go under the name of the sons of Korah, or the Korahites—a family of singers descended from the Levite Korah, known from the Pentateuch. Their head at the time of David was Heman. Part of these psalms belongs to the time of David; others, to that of Solomon, and others are of an uncertain later period. Respecting the psalm inscribed "Prayer of Moses," there seems, indeed, to be no valid reason against its authenticity; it is quite worthy of the great legislator, and to a certain extent similar to other compositions of which he is reasonably regarded as the author. The numerous body of psalms attributed to David, manifest (those at least which can fairly be believed to be his work) a vivid and profound feeling and rare poetical gifts. The singer abandons himself entirely to whatever feeling of joy or grief, repentance or revenge, piety or despair, sweeps over his soul. This also accounts to a certain extent for the violent manner in which he calls down at times the vengeance of God upon the heads of his adversaries; while at others, he humbles himself to the dust on account of his own iniquities. On his style and manner, we cannot enlarge here; suffice it to add, that his lyrics have deservedly been counted among the gems of all human literature for well nigh 3,000 years—quite apart from their sacred liturgical character. Asaph's psalms show their author to have been a didactic poet of high order; but, as we said before, many of those ascribed to him belong to poets later than the schism, and even posterior to the exile. The Korahite hymns, although all more or less fraught with the same depth of feeling, the same conciseness, the same grandeur and lyrical exaltation, exhibit signs of being written partly during the time of Solomon, or even during the exile. Of the anonymous psalms, some may fairly be added to the number of those that issued from the hand of the royal singer himself; others, however, belong to the post-exilian times. Some of these (the *hallelujahs*, for instance, or the "Songs of Degrees") were, in all probability, pilgrim-songs, chanted during the ascent to the sanctuary. Whether other psalms belong to the Maccabean period or not—a question hotly disputed—we cannot discuss here.

There is a great deal in favor of the opinion that the collection and redaction of the book, such as we have it now, is owing to one man, who arranged the single hymns according to their contents and tendency. Thus, following all the while the law of analogy, the redactor gave the first place to David's and his contemporaries' (Asaph, Ethan, Heman) compositions. These were further classified according to the prevalent use of the peculiar divine name (Jehovistic and Elohistic), and were divided into three books—the first of which contains the Davidic Jehovistic psalms; the second, the Elohistic ones of the Korahites, of Asaph, David, Solomon, and some unknown poets; the third, the rest of Asaph's and the Korahite psalms of a mixed (Jehovah-Elohistic, or purely Jehovistic) nature. The arrangement within these larger classes was made, again, according to the inner nature and relation of these hymns to each other, and by a certain likeness in phraseology, similes, etc. Psalms i. and ii. were then prefixed, on account of their generally introductory matter and manner. The same laws have also been followed in the remaining portions of the collection.

It is difficult to fix the period of the redaction. Assuming, however, the collecting and editing to be the work of one man, he could not possibly have lived before the time of Nehemiah, even according to those who affirm the non-existence of Maccabean psalms in our canon. If, on the other hand, various single collections are assumed, out of which our present book has grown, there is no reason why some of those should not be placed at a much earlier date. We forbear to add a list of writers on the subject of psalms. Nearly all the principal authorities in biblical literature, in the Jewish, Roman, and Protestant churches, have contributed their share toward the elucidation of the Psalms; and to the individual works of the chief biblical commentators, the reader is referred for special information. Le Long, in his *Bibliotheca Sacra*, enumerates more than 500 commentators on the Psalms, and Calnet carries the number up to a thousand. Of these, some are very voluminous, that of Le Blanc filling no fewer than six folio volumes.

PSALTERY, a stringed instrument of music, to accompany the voice. The Hebrew *nebel* is so rendered in the authorized version wherever it is used, except in a few passages in Isaiah and in Amos, where it is translated viol. The ancient viol was a six-stringed guitar. In the prayer-book version of the Psalms the Hebrew word is rendered

lute. These three instruments resemble each other, though they are different. The Greek *Psalterion* from which our word is derived, denotes an instrument played with the fingers instead of a plectrum or quill. With what instrument the nebel corresponded it is impossible to say. The psalter of David was made of cypress, that of Solomon of the algum tree. The psalter was one of the instruments played before Nebuchadnezzar's golden image.

PSAMMENTITUS or PSEMETEK. See PSAMMETICHUS, *ante*.

PSAMMETICHUS, the name of three kings of Egypt, of the 26th dynasty, distinguished on the monuments by different prenomens, and of two other persons of ancient history. The first and most notable Psammetichus was the son of Necho I. After the defeat and death of his father, he fled into Syria, and thence, by means of foreign aid, appears to have established himself as one of the twelve monarchs who then reigned over Egypt, with the rest of whom he was connected in a kind of federation. An oracle having declared that the monarchy of the whole country should go to that one who made a libation out of brass, Psammetichus fulfilled the condition by pouring it out of a brazen helmet. By the answer of another oracle, he was told that he should succeed by means of brazen men who would appear from the sea. Some Carian and Ionian pirates who appeared soon after in panoplies of brass on the shores of Egypt, answered the response of the oracle. Psammetichus engaged them in his service, and by their means finally subdued his rivals at Momemphis, after a struggle of fifteen years' duration. He strengthened his power by employing Greek mercenaries, whom he settled at Daphnon and Pelusium, to protect the eastern borders of Egypt, and whose head-quarters were subsequently transferred to Memphis. To them he assigned the right wing, or post of honor, in the army—their arms and discipline being far superior to that of the native troops. This proceeding gave great disgust to the Egyptian army, and on his refusing to send the Greeks home, after their term of service, the Elephantine garrison of 240,000 men deserted the country, and marched into Ethiopia beyond Merot. Although exhorted, they refused to return. To protect Egypt from the Syrians, he besieged Azotus, which he finally took, after 20 years' siege. Psammetichus fostered in every way the Greek influence in Egypt, divided among them lands, encouraged the study of the language, and contracted alliances with the Athenians. He also facilitated the commerce, and opened the ports which had been hitherto closed. Under Psammetichus the arts revived, the sculpture and architecture imitated the older prototypes, and the government was remodeled on the plan of the ancient dynasties. In literature, a new handwriting, the demotic, was introduced. Egypt, however, had fallen into a national decadence, and its old polity and institutions, subverted by the foreign influence prevalent in the country, could not be restored. Psammetichus reigned, according to Manetho, 54 years; his reign closed about 609–10 B.C. The other personages of this name are of little importance.—Herodotus, ii. 154; Pliny, *Nat. Hist.* vi. 35; Diodorus, i. 67, Champollion-Figeac, *L'Egypte*, pp. 367–70; Sharpe, *Hist. Egypt*, p. 58.

PSEUDEPIGRAPHA, "false additional writings," a large number of books and fragments which were designed by their authors to be added to the canonical books of the Old and New Testaments. While the apocryphal books, which many branches of the Christian church append to the Old Testament as at least "deutero-canonical," are valuable for various purposes and in different degrees, the pseudepigrapha, whether pretending to belong to the Old or New Testament, are as a class entirely worthless, most of them being manifest forgeries, some of ancient, and others mediæval date; of various origin, Jewish, Gnostic, and Christian. Some of those relating to the Old Testament are: *History of Antiochus*; *History of Azenath*; *Epistle of Baruch*; *Book of Elias*; *Books of Jasher and Jezirah*; III., IV., and V. of *Maccabees*; *Assumption of Moses*; *Preaching of Noah*; *Testament of the Twelve Patriarchs*; *Psalms of Solomon*; *Books of Zohar*; *Enoch*; *Jubilees*; IV. of *Esdra*s; the Apocalypse, and vision of *Esaias*. Many of them are happily lost, and some are known only by name. The number of spurious books relating to New Testament times is still greater. Among them are the so-called "*Gospels*," of *James*; *Muthias*; *Nativity of Mary*; *History of Joseph the Carpenter*; *Thomas*; *The Infancy*; *Nicodemus*; *Egyptians*; *Andreu*; *The Twelve Apostles*; *Judas Iscariot*; *The Manichees*; and *Marcion*. The spurious "*Acts*," "*Epistles*," and "*Revelations*" are very numerous. None of these various classes that are extant have any even plausible claims to canonical authority.

PSEU DOSCOPE (*pseudos*, false, and *skopein*, to see), an optical instrument invented by prof. Wheatstone, and so called from the fact of its exhibiting objects, viewed through it, under aspects the exact converse of their natural appearance. Its construction is shown by the annexed figure: *abc*, two rectangular prisms of flint-glass, the hypotenuses of which measure $1\frac{1}{2}$ in. in length, and $1\frac{1}{4}$ in. in depth. The prisms are hinged at *c*, so that they may be inclined toward each other in any desired degree, and are fixed each in a wooden framework, fastened together by the hinge or pivot *d*. By means of the pivot *d*, the distance between *c* and *c* may be made to accommodate itself to the different interval between the eyes in various observers. In using the instrument the eyes are placed at *E* and *E* respectively. The thumb-pieces attached to the prisms at *a* and *a* are used in adjusting the instrument for distinct vision of any particular object. The optical

effect of each prism is twofold: it displaces the object, and it procures the lateral inversion of the image. From the latter circumstance, it follows that the right-hand side of a cube, for example, is seen on the left, and *vice versa*; this inversion being occasioned by the reflection of the rays upon the side of the hypothenuse within each prism. By the two refractions undergone by the rays as they enter and leave the prisms, the axis of the emergent pencil is no longer directed toward the real place of the object, but is diverted in such sort that the convergence of the optic axes diminishes as the distance of the object diminishes; and increases as its distance increases—a complete reversal of the ordinary conditions of sight, and one which, in conjunction with the lateral inversion before mentioned, gives rise to very curious visual phenomena. See VISION. It is essential to the efficient use of this instrument that the object be seen by both eyes; and therefore the observer, having placed the object at the usual distance for distinct vision, should, by closing the eyes alternately, ascertain that it is within the field of each prism. He should then adjust the prisms until the two images coincide in point of space, when they will coalesce, and, at first, the object will probably retain its natural aspect; but on a sudden it undergoes a change, and the converse appearance stands out to view with the utmost distinction and reality. A hat will appear to be turned completely inside out; the interior of a basin will appear convex and protruding; and “a bust regarded in front becomes a deep hollow mask.” To facilitate the illusion, the object should be equally illuminated on either side, so as to prevent shadows.—For a full account see the original paper by Wheatstone, *Phil. Trans.*, 1832, p. 11, *et seq.*

PSIDIUM. See GUAVA.

PSITTACIDÆ. See PARROT.

PSKOV (Ger. *Pleskau*), a government in the n.w. of European Russia, lies s. of the governments of St. Petersburg and Novgorod. Area, 17,045 sq.m.; pop. '70, 775,701, almost all Russians, except in the western districts, where there is a small number of Finns. The climate is temperate, the surface is hilly in the w., and the soil is of average fertility. Lake Pskov and lake Ilmen receive almost all the drainage of the government, the river Velikaia falling into the former, and the Shelon, the Polista, and the Lovot into the latter. The rivers are navigable for rafts, and, nearer their mouths, for barges and ships. Lakes abound in the eastern and south-eastern districts. Agriculture is the staple employment; flax-growing being the most remunerative branch. The manufactures carried on in the government are inconsiderable. The St. Petersburg and Warsaw railway, by which ready access is afforded to the metropolitan market for the agricultural productions of Pskov, has exercised a most beneficial influence in developing the industry and resources of the government.

PSKOV, a t. in the n.w. of European Russia, capital of the government of the same name, stands on the banks of the Velikaia, 180 m. s.s.w. of St. Petersburg by railway. During the 14th and 15th centuries it made one of the confederation of the Hanse towns, and had then a population greater than at present. In 1510 it was annexed to the kingdom of Moscow. During the wars with Lithuania, Pskov was a stronghold of great importance. It contains a cathedral, 42 churches, and 4 monasteries. Fish, obtained from lake Peipus, and flax, are the principal articles of a foreign commerce which is not extensive. Pop. '37, 12,981.

PSOPHIIDÆ, a group of birds allied to the cranes, which has been ranked as a family, for the reception of the genus *psophia*, which contains five species, found in Brazil and northern parts of South America. They are represented by the *trumpeter*, which is a bird about the size of an ordinary barnyard fowl, but with long legs and neck, like other cranes. It inhabits the forests and wild uplands, never visiting fens or the borders of lakes or rivers. It walks and runs very swiftly, but rises in flight only a few feet from the ground. The name of the bird is derived from the hollow internal sound which it is said to make without opening the bill, and is attributed to the passage of air from the lungs into two large membranous bags which are attached to the windpipe as it enters the chest. See AGAMI, *ante*.

PSORALEA, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*, having the calyx permanent after flowering, and its tube sprinkled with callous points; the legume one-seeded, sometimes ending in a beak. The flowers are blue, purple, or white. The leaves are of various forms, but in general abruptly pinnate. Some of the species are natives of India, others of other warm countries.—*P. esculenta*, the BREAD-ROOT of North America, and *prairie apple* of the Canadian boatmen, is an herbaceous perennial about a foot high, with a carrot-like root, swollen above the middle, and abounding in farinaceous matter. It is used as an article of food, both boiled and raw. In Britain it requires the protection of a frame, in order to produce an abundant crop or large roots.

PSORIASIS (from the Greek word *psora*, which signifies a cutaneous eruption, supposed by some to be the itch) is now employed to signify a disease characterized by slight elevations of the surface of the skin covered with whitish scales. There are various forms of this disorder, such as *P. guttata* (which is the simplest kind, and derives its specific name from the scales not coalescing, but remaining distinct, like isolated drops of water on the skin); *P. diffusa*, when the disease spreads over large portions of the skin, and often renders the patient hideous to look at, the scaly incrustations being often interspersed with bleeding cracks and fissures in all directions; *P. inveterata*, which is merely the severest phase of the preceding form, and occurs chiefly in aged persons of broken-down constitution; and *P. gyrata*, a rare form, in which the disease occurs in narrow stripes or rings. The causes of psoriasis are very obscure. It is certainly not contagious, but there appears to be in some families an hereditary tendency to it. It is occasionally associated with gout and rheumatism. Persons of both sexes, of all ages, and of all conditions of life, are liable to it, although it is more common in middle and advanced life than in childhood. The *treatment* varies with the condition of the patient. A middle-aged, vigorous patient should be purged two or three times a week with sulphate of magnesia, should be restricted in his diet to vegetables and milk, should be debarred from all stimulants, and should take a warm bath daily. The internal remedies of most repute for this disease are—1. Decoction of dulcamara, from half a pint at first to a pint being taken in divided doses through the day; 2. Liquor potasse, in doses of from half a dram to a dram, three times a day, in a glass of milk or beer; 3. Liquor arsenicalis, in doses of from three to four minims, three times a day, to be taken after meals; 4. Iodide of potassium, in five-grain doses, three times a day; and 5. Pitch pills. In very inveterate cases, tar ointment, first diluted with lard, or a weak ointment of iodide of sulphur, should be applied locally; but these should not be tried unless internal treatment fails.

PSYCHÉ (Gr. breath, or soul), a creation of the later mythology of Greece, or perhaps we should rather say, a personification of the human soul, devised by the later poets. Appuleius (q. v.) relates the following story about her, which is obviously allegorical. Psyché was the youngest of three daughters of a king. She was so exquisitely beautiful that mortals mistook her for Venus, and did not dare to love, but only to worship her. This excited the jealousy of the goddess, who sent Eros (Cupid) to inspire Psyché with a passion for the most contemptible of all men; but Eros was himself wounded as deeply by her glances as ever he had wounded other with his darts. Meanwhile, Psyché's father wished to see his daughter married, and inquired about her at the oracle of Apollo, by whom he was told to bear the maiden in funeral robes to the summit of a hill, and to leave her there alone, as she was destined to be the bride of a huge all-destroying snaky monster, that terrified both gods and men. Amid loud wailing and lament, Psyché was borne to the fatal spot, and left trembling in horrible solitude, when suddenly a light-winged zephyr flew round her, and bore her off to a beautiful palace of pleasure belonging to Eros, who visited her, unseen and unknown, every night, and left her before morning broke. Here Psyché would have enjoyed perpetual delight, had she remembered the advice of her unknown lover, who warned her not to seek to know who he was. But her jealous sisters, whom, against Eros's injunction, she had allowed to visit her, working upon her curiosity, persuaded her that she was embracing a monster in the darkness of night; and having lighted a lamp when Eros was asleep, she saw with rapture that she was the mistress of the most handsome of gods. In her excitement, she let a drop of hot oil fall on the sleeper's shoulder, who awoke, upbraided her for her mistrust, and vanished. Psyché gave way to the most passionate grief; she even thought of drowning herself. After wandering about for some time, she came to the palace of Venus, where she was seized by the goddess, and kept as a slave. Eros, however, who still loved her, invisibly helped and comforted the hapless maiden, reconciled her to his mother, and was finally united to her in immortal wedlock. All critics have agreed to consider the story an allegory of the progress of the human soul through earthly passion and misfortune to pure celestial felicity.

PSYCHOL'OGY. See MIND, *ante*; CAUSE; CONSCIOUSNESS; EMOTION; INTELLECT; WILL; SOUL.

PTAH, or **PTHATH**, an Egyptian deity, supposed to be the same as the Greek Hephaistos and the Latin Vulcan. He was worshipped chiefly at Memphis.

PTARMIGAN, *Lagopus*, a genus of *tetraonidae*, differing from the true grouse (q. v.) chiefly in having the toes thickly clothed with short feathers as well as the legs (*tarsi*). Hence the name *lagopus*, a name used by Pliny, from the resemblance of the foot to that of a hare. The bill is very short, and clothed at the base with feathers. The species are natives of the northern parts of the world, and either of elevated or of strictly arctic regions. They are not polygamous, like the true grouse, nor do the males strut with erected and expanded tail. Most of the species change color very much on the approach of winter, assuming a white, or nearly white plumage, and the diversities of color have caused some confusion and difficulty concerning them. They are all much esteemed for the table. The COMMON PTARMIGAN, or GRAY PTARMIGAN (*L. vulgaris* or *L. mutus*), is a native of the most northern parts both of the old and new worlds. In Britain, it is now seldom seen much further s. than the Grampians, and occurs only on high moun-

tains. It was formerly an inhabitant of those of Cumberland and Wales. It is not found in Ireland. It is abundant in Norway, from which great numbers are annually brought to the London market. In arctic countries the haunts of the ptarmigan are not mountain-tops, but low valleys and plains even to the sea-shore. In form and habits, it much resembles the moor-fowl (q.v.), but is rather smaller. The winter plumage is pure white, except a black band above the eye of the male, and some parts of the quill and tail feathers. The summer plumage is as beautifully adapted to the concealment of the bird from enemies, by its harmony with the general aspect of the ground, as that of winter; the male being mostly brownish-gray, with undulating lines of black; the wings, middle tail-feathers, and under parts of the body, white; the female similar, but with a prevalent yellow tinge. The plumage, however, varies very much, according to age, sex, and the season of the year. Ptarmigans seem to trust very much for safety to the facility with which they are able to elude observation, whether among the snows of winter or the lichen-covered rocks in summer, and an unaccustomed sportsman is often startled by a covey springing up close beside him, of which he had not previously observed one. The ptarmigan is capable of being tamed, and has even been found to breed in confinement. The voice of the ptarmigan is a low croaking cry. The name ptarmigan is a modification of the Gaelic name. The *rock ptarmigan*, said to occur in the n. of Scotland, and to be common in Norway, seems to be merely the common species in a particular state of plumage.—The moor-fowl (q.v.) is a species of ptarmigan.—Another is the WILLOW PTARMIGAN, or WILLOW GROUSE (*L. salsicola*), of the northern parts of the world, abundant in the arctic parts of America, and in Norway, from which great numbers are brought to the London market. Its summer plumage much resembles that of the moor-fowl, but its winter plumage is white. It does not inhabit regions so cold or lofty as the common ptarmigan, but loves thickets of willow and dwarf-birch. It is found in Europe as far s. as the valleys of the Alps. In North America it is partially migratory.—There are other species in Siberia, Iceland, the Rocky mountains, the mountains of Mexico, etc.

PTERICHTHYS (Gr. wing-fish), a genus of ganoid fishes, peculiar to the beds of the old red sandstone measures. Fragments of the bony case had been found in Russia as early as 1813; in 1840 they were described as belonging to a fish to which the generic name *asterolepis* was given. In the same year the late Hugh Miller exhibited to the members of the British association the first specimen which gave an idea of the form of the fish, and to this Agassiz applied the generally-received name of pterichthys, from the wing-like appearance of the pectoral spines.

The head and anterior half of the body were covered with hard ganoid plates, fitting closely to each other, and forming a strong protecting case. The remainder of the trunk was flexible, and covered with small scales. The fish was furnished with a small dorsal fin, and the body terminated in a heterocercal tail; but neither of these, from their soft texture, is common in the fossil specimens. The creature was not fitted for rapid motion. The pectoral spines, which were at first erroneously supposed to be fins, were more probably used as weapons of defense, and perhaps they were also of service in assisting the pterichthys to move along the sandy bottoms on which it lived. The spines were composed of two segments, and were covered with tubercles like the trunk. Twelve species of the genus have been described.

PTEROCARPUS. See KINO, *ante*.

PTEROCLES. See GANGA.

PTERODACTYL (Gr. wing-finger), a remarkable genus of fossil lizards, peculiar to the secondary strata. Its anomalous structure was long a puzzle to comparative anatomists. Blumenbach considered it a palmipede, or web-footed bird; while its original describer, Collini, and other more eminent naturalists, referred it to the mammalia, finding its nearest ally in the bat. The careful investigations of Cuvier, however, showed that the pterodactyl was a true lizard, but possessed of the power of flight, which it performed, not by a membrane stretched over its ribs, like the living dragons, but more as in the bats, except that the wing was attached, not to several, but only to a single finger—the fifth—the others being free and short. The bones of the fifth finger were very greatly elongated, and the last joint terminated in a long, slender, unguarded apex; the terminal joints in the other fingers were furnished with strong claws. Mantell thus graphically describes the genus: "With a long-snouted head and long neck much resembling that of a bird, bat-like wings, and a small trunk and tail, with lacertian affinities in its skull, teeth, and skeleton, and with a bird like structure of sternum and scapular arch, these creatures present an anomaly of structure as unlike their fossil contemporaries as the duck-billed ornithorhynchus of Australia to living mammals. The cranium is small; the jaws are long, and either armed with numerous, sharp-pointed teeth, or toothless, like those of a bird. The eye-orbit is very large; the sclerotic consists of a ring of bony plates, and the nostrils are placed near the orbits. The cervical vertebræ are large and strong, and capable of great flexibility backward and forward, probably to allow the head to fall back to the center of gravity during flight. The dorsal vertebræ are from 17 to 20 in number. The sacrum is formed by the coalescence of two vertebræ only, as in existing reptiles, and not of many, as in birds and certain extinct saurians. The tail is generally short, an unusual character with saurians; but a species with a

long tail occurs at Solenhofen. There are five toes or digits on each foot; the outer finger of the forearm is immensely elongated for the support of a membranous expansion (the impression of which is preserved in some instances); and the other digits of fore and hind feet terminated in long curved claws. The size and form of the extremities show that the pterodactyl was capable of perching on trees, of hanging against perpendicular surfaces, and of standing firmly on the ground, when, with its wings folded, it might crawl on all-fours, or hop like a bird." The famous quarry of lithographic stone at Solenhofen, of upper oolite age, has supplied a great variety of these flying lizards; but the largest species have been found in the secondary beds of this country. In the upper greensand, at Cambridge, the remains of a species that must have had a spread of wing of 25 ft. across have been found; and in the Kentish chalk another has been met with very little short of this in its dimensions. The various species vary as much in structure as in form, so that the original genus has been lately raised to the position of an order, under the name of PTEROSACRIA, and the species have been arranged under the following genera, characterized principally by the structure of the jaw and teeth: *pterodactylus*, in which the jaws are furnished with long slender teeth along their whole length; *ramphorhynchus*, with the extremities of the jaws smooth, probably furnished when living with a horny bill, and toward the bases of the jaws having four or five strong teeth; and *dimorphodon*, with large strong teeth in front, and small shorter ones behind. Nearly 30 species have altogether been described.

PTEROMYS. See FLYING SQUIRREL.

PTEROPIDÆ, a family of bats belonging to the section *frugivora*. They are commonly called *for bats*, from the resemblance of the head to that of the fox. The ears are simple and of moderate size, and the nose is destitute of any appendages, as in many other bats. Both jaws are armed with cutting incisors, and although their principal food is fruit, they also eat insects, as well as small birds and mammals. The molars are not cuspidate, but are furnished with blunt tubercular crowns. The tail is very short, sometimes absent. The index and pollex (thumb) are generally armed with claws. The pteropidæ are among the largest of bats; the *pteropus edulis*, or kalong, sometimes measuring 5 ft. from tip to tip of wing. They are principally found in Java, Sumatra, and Borneo; also in Asia, Australia, and Africa. They are not found in America. According to Dr. Horsfield, the kalong is very abundant in the lower parts of Java, and uniformly lives in society. Numerous individuals select a large tree for their resort, and suspending themselves with the claws of their posterior extremities to the branches, often in companies of several hundreds, present a curious sight. A species of figs (*caoutchouc*) is a favorite retreat, and sometimes the branches are covered with them. They pass the greater portion of the day in sleep, hanging motionless, ranged side by side with the head downward, the membrane folded and drawn about the body, and would be mistaken by a stranger for a part of the tree, or some kind of suspended fruit. In consequence of the sharpness of their claws their attachment is so strong that they cannot readily leave their hold without the assistance of the expanded membrane; and if shot while hanging, they continue suspended after death. Soon after sunset they pursue their nocturnal flight in search of food. They are very destructive to the gardens, delicate fruits, such as mangoes, jambus, lansas, etc., being devoured by them with great voracity, and it requires much care and perseverance in saving fruit. The flight of the kalong is slow and steady, pursued in a straight line, and capable of long continuance. The hunting of these bats sometimes affords amusement to the inhabitants during moonlight nights, which in Java are very serene. There are several genera and species. The species just described, *pteropus edulis*, is sometimes named *P. Jacanicus*. A species with tails is *P. stramineus*, with reddish-yellow fur; expansion of wing, 2 feet. Brought from Timor and Péron by Lesueur. One genus, *cephalotes*, has a conical head, short ears, very short tail. Dental formula, $i, \frac{2-2}{3-3}; c, \frac{1-1}{1-1}; m, \frac{5-5}{4-4} = 32$. In *C. peronii* the wings spring from the middle of the back. Another genus, *harpya*, found in the Moluccas, is about the same size, with grayish fur. Another genus, *macroglossa* (F. Cuvier), resembles *pteropus*. Its character depends on the extreme length of the head, the absence of false molars, the great development of the posterior molar, and the extensible tongue. Dental formula, $i, \frac{2-2}{2-2}; c, \frac{1-1}{1-1}; m, \frac{5-5}{6-6} = 34$. *Epomophorus* of Gray, *pteropus epomophorus* of Bennett, pale brown back, belly white; total length, 6 to 7 in.; length of head, $2\frac{1}{2}$ in.; expansion of wing, 12 inches.

PTEROPODA (Gr. wing-footed), a class of mollusks having for their only organs of locomotion wing-like fins attached to the sides of the head or neck, one to each side, by which they make their way through the water, flapping them as a bird or an insect does its wings in the air. They are allied to *gasteropoda*, but are inferior to them in organization; and their wings are not at all homologous to the foot of that class. They are hermaphrodite. The head is perfectly distinct in some, but obscurely distinguished from the body in others. Those which have the head most distinct, as *clio* (q.v.), have no shell, and form the order *gymnosomata*; those with the head indistinct, the order *thecosomata*, have a thin external shell, which in some is globular, with slits for the wings to

pass through, in some triangular and pyramidal, in some conical, in some slipper-shaped, etc. All the species are marine; they are small and delicate creatures, very lively and active, always in quest of food, and affording food to fishes and cetaceans. They are found in all parts of the world, some of them in immense numbers in tropical, and some in arctic seas. None of them are common on the British coasts. The genera and species are few.

PTOLEMAIC SYSTEM of astronomy, so called from Ptolemy (q.v.), its chief expounder, was originated, however, long before his time, and was, in fact, merely an attempt to reduce to a scientific form the common and primitive notions concerning the motions of the heavenly bodies. It was implicitly adopted by Plato, Aristotle, Hipparchus, and (with the exception of the Pythagoreans, and probably of Pythagoras himself) all the eminent physicists and philosophers of ancient times; passing from them to the Byzantines and Arabs, who, especially the latter, were the means of disseminating it through western Europe, where it continued to be the universally established doctrine till the 16th century. The primary and fundamental doctrines of this system are that the earth is the center of the universe, and that the heavenly bodies revolve round it in circles, and at a uniform rate. These notions, which are naturally suggested by the first general aspect of things, having, previous to any accurate observation, established themselves as unquestionable axioms, phenomena which were found, on closer examination, to be inconsistent with them, were explained by the introduction of additional hypotheses. The belief that the earth is the center of the universe was supported by its being in accordance with the relation of the primary elements of which the material world was supposed to be composed. Thus, earth, the most stable of the elements, held the lowest place, and supported water, the second in order; above water was placed air, and then fire, ether being supposed to extend indefinitely above the others. In or beyond the ether element were certain zones or heavens, each heaven containing an immense crystalline spherical shell, the smallest inclosing the earth and its superincumbent elements, and the larger spheres inclosing the smaller. To each of those spheres was attached a heavenly body, which, by the revolution of the crystalline, was made to move round the earth. The first or innermost sphere was that of the moon, and after it in order came those of Mercury, Venus, the Sun, Mars, Jupiter, Saturn, and the fixed stars, eight in all. To this system later astronomers added a *ninth* sphere, the motion of which should produce the precession of the equinoxes (q.v.), and a *tenth*, to cause the alternation of day and night. This tenth sphere, or *primum mobile*, was supposed to revolve from e. to w. in 24 hours, and to carry the others along with it in its motion; but the Ptolemaic astronomers do not venture to explain how this was done, although since the axis of motion of the *primum mobile* was that of the equator, its extremities being the poles of the heavens, while that of the ninth sphere was the axis of the ecliptic, some explanation was certainly necessary. As observations of the heavens became increased in accuracy, it was found that the heavenly motions were apparently not uniform, and this was explained as follows: The acceleration of the sun on one side, and retardation on the other side of his orbit, is only apparent, and results from the earth not being in the center of his sphere, C (see Fig.), but at E, and consequently his motion appears to be slowest at P, and quickest at R. The alternate progression and regression of the planets was accounted for by supposing them to move, not directly with their crystallines, but in a small circle, whose center was a fixed point in the crystalline, and which revolved on its axis as it was carried round with the latter; thus (fig.) the planet was carried round the small circle ABD, as that circle was carried round PQR (now supposed to represent the planetary crystalline). The planet, while in the outer portion of its small circle, would thus have a forward, and in the inner portion a backward motion. The larger circle was called an *eccentric*, and the smaller an *epicycle*. This theory of eccentrics and epicycles satisfied the early astronomers; but further investigation showed its incompleteness, and in later times it was found necessary to explain newly discovered discrepancies by heaping epicycle upon epicycle, till such a complication of the system had been produced as drew from Alfonso X. of Castile, to whom the Ptolemaic system was being explained, the humorous though somewhat blasphemous remark, that "if the Deity were now to reconstruct the world, he (Alfonso) could give him a few useful hints." As soon as astronomers came to understand and test the *Copernican theory* (q.v.), the venerable and disorderly pile of hypotheses, the then representative of the Ptolemaic system, which had received the papal seal of infallibility, and had in various forms held supreme sway over the minds of men for twenty centuries, at once crumbled to atoms, and sunk into oblivion.

PTOLEMAIS. See ACRE.

PTOLEMY, a celebrated astronomer and geographer, whose proper name is CLAUDIUS PTOLEMAEUS, was a native of Egypt, though it is uncertain whether he was born at Pelusium or Ptolemais in the Thebaid. Nothing is known of his personal history, except

that he flourished in Alexandria in 130 A.D. and there is probable evidence of his having been alive in 161 A.D. The chief of his writings are: *Megalē Synaxis tēs Astronomiās*, which, to distinguish it from the next-mentioned, was probably denominated by the Arabs *meqistē*, the greatest, whence was derived the name *Almagest* (Arab. article *al*, the), by which it is generally known; *Tetrabiblos Syntaxis*, with which is combined another work, called *Karpos* or *Centiloquium*, from its containing a hundred aphorisms, both works treating of astrological subjects, and held by some on this account to be of doubtful genuineness; *Phasēis aplanōn asterōn kai synagōgē episēmaseiōn*, a treatise on the phenomena of the fixed stars, or a species of almanac; the *Geographikē Hypthēsis*, his great geographical work, in eight books. The rest of his works are of inferior importance, and consist of descriptions of various kinds of projections (q.v.), the theory of the musical scale, chronological and metaphysical treatises, and a summary of the hypotheses employed in his great work, the *Almagest*. Others of Ptolemy's works have been lost, and it is still a moot-point whether or not they contained a treatise on optics, as a Latin version of what is said to have been an Arabic translation of Ptolemy's original treatise on that subject is still in existence.

Ptolemy, both as an astronomer and geographer, held supreme sway over the minds of almost all the scientific men from his own time down till about the 15th c.; but, and in astronomy specially, he seems to have been not so much an independent investigator as a corrector and improver of the work of his predecessors. In astronomy he had the labors of Hipparchus to guide him; and, indeed, scrupulously distinguishes between Hipparchus's labors and his own. To Ptolemy belongs the invention of a planetary theory, the discovery of the moon's evection (q.v.), and the singular distinction of being the sole existing authority on the subject of ancient astronomy. From this last-mentioned fact, the system of astronomy which he sets forth in the *Almagest* received his name; and, as the *Ptolemaic system* (q.v.), obtained the homage of succeeding generations till the time of Copernicus. His great work, the *Almagest*, is divided into 13 books. Ptolemy seems to have been little of an independent observer, trusting implicitly to his predecessor, Hipparchus; but his geometrical powers were of a very high order, unless, as Delambre suggests, but with little probability, the elegant demonstrations here and there occurring in the *Almagest* were borrowed from other sources.

As a geographer, Ptolemy occupies a similar position to what he holds in astronomy; he appears before his readers as the corrector and improver of the works of a predecessor, Marinus of Tyre, about whom, except from Ptolemy's writings, little is known. Ptolemy here appears to more advantage as an independent investigator, and his improvements and suggestions are at once more valuable and correct; but it is sometimes difficult to separate his data from those of Marinus. His geography is divided into eight books, all of which, with the exception of the first, eighth, and a portion of the seventh, are nothing more than a catalogue of places, with their latitude and longitude (to 12ths of a degree), with a brief general description prefixed to each continent and country or tribe, and interspersed here and there with remarks of a miscellaneous character on any point of interest. The rest of the work contains details regarding his mode of noting the positions of places—by latitude (*mēkos*) and longitude (*platos*)—with the calculation of the size of the sphere of the earth, and of the extent of surface then known. He also describes the mode adopted by him of projecting the surface of a hemisphere on a flat surface, and shows its superiority over the projections of Eratosthenes, Hipparchus, and Marinus. He also constructed a series of twenty-six maps, together with a general map of the world, in illustration of his work.

The *Almagest* and the *Geography* were the standard text-books to succeeding ages, the first till the time of Copernicus, the second till the great maritime discoveries of the 15th c. showed its deficiencies. They have passed through numerous editions, the best of which are, for the *Almagest* and the most of Ptolemy's minor works, that by Halma (Paris, 1813-16-19-20, quarto); and for the *Geography*, the Latin versions of 1482 and 1490, published at Rome, the *editio princeps* of the Greek text by Erasmus (Basel, 1533, 4to), and the Elzevir edition (Lugd. Bat. 1619, fol.). The catalogue of stars has been frequently reprinted separately, the last and best edition being that of Francis Baily, in vol. xiii. of the *Memoirs of the Royal Astronomical Society* (London, 1843).

PTOLEMY I., son of Lagns, is also known by his surname **SOTER**, or the preserver. He was believed by some to be the son of Philip of Macedon, because his mother, Arsinoë, had been a concubine of that king, his father being a Macedonian of humble station. Ptolemy acted as one of Alexander's generals in his eastern campaigns; and when the possessions of the great conqueror were divided, after his death at Babylon, 323 B.C., Egypt fell to the lot of the son of Lagus. Troubles soon followed such an acquisition; but Ptolemy was a man of energy and valor, and not only warded off danger from his own realm, but also extended his dominions by the addition of Phenicia and Cœle-Syria, capturing Jerusalem, too (most probably in this expedition), by assaulting it on the Sabbath day. In 316 B.C., war again broke out between Ptolemy, Lysimachus, and Cassander on the one hand, and Antigonus on the other. (See these names.) It lasted till 301 B.C.; and at its conclusion Ptolemy was left in possession of almost the same territory as he ruled at its commencement, with the exception of Cyprus, which, by the naval battle off Salamis in that island (306 B.C.), was gained by Antigonus. Ptolemy,

however, recovered Cyprus in 295 B.C., and it was thereafter attached to the Egyptian kingdom. After said battle of Salamis, in 306 B.C., Antigonus assumed the title of king, which example Ptolemy and the other successors of Alexander followed. In 305 B.C. Ptolemy compelled Demetrius, the valiant son of Antigonus, to raise the siege of Rhodes, for which deliverance the Rhodians were so grateful that they worshiped him as a deity, and conferred on him the title of *soter*, or preserver. The latter part of his reign was peace. He governed his kingdom with an enlightened and vigorous policy, and so laid the foundation of that prosperity which Egypt enjoyed for many succeeding generations. He encouraged commerce, and soon made Alexandria the great mart of the Mediterranean. He fostered literature, science, and art; and not only founded the famous museum and library of Alexandria, but also entertained at his court the votaries of the muses; Euclid, the geometrician; Stilpo, the philosopher; Philetas, the elegiac poet; Zenodotus, the grammarian; Antiphilus and Apelles, the painters; with many others. The history of Alexander's wars, by Ptolemy, is the basis of Arrian's work on the same subject. Two years before his death, which occurred in 283 B.C., he abdicated in favor of his son, Ptolemy Philadelphus. His reign extended from 323 to 285 B.C.

PTOLEMY II., surnamed **PHILADELPHUS**, was the son of Ptolemy I. and Berenice. He was born, 309 B.C., in the island of Cos. His reign is remarkable rather for the successful cultivation of the arts of peace than of the practice of war. Excepting a contest with his half-brother, Magas, for the province of Cyrene, his wars against Syria are almost the only military exploits which interfered with the prosecution of those designs, for the improvement of his kingdom, which have rendered his name famous among wise and enlightened sovereigns. He carried on, with even increased zeal, the good work which his father had begun. He enriched the library of Alexandria with all the literary treasures of his own and of earlier times, and the museum was crowded with the learned from all countries—with such men as Theocritus and Philetas, the poets; Euclid, the geometrician; Aristarchus and Aratus, the astronomers; Theodorus and Hegesias, the philosophers; and many more. Tradition alleges that it was by his orders the Hebrew Scriptures were translated into Greek, and the version called the "Septuagint" (q.v.) thus formed. He induced Manetho to write, in Greek, a political history of Egypt, and an account of the religious tenets of the Egyptians. He encouraged the study of natural history; and to facilitate the pursuits of those who devoted themselves to it, he formed a collection of rare and curious animals in the preserves, which we may call the "royal zoological gardens" of Egypt. He founded many colonies in those parts of his empire which seemed specially suited to become centers of trade and of enlightenment, and thus spread more widely the seeds of civilization and Greek culture; among these was Ptolemais (Acre), in Palestine. He ruled over Egypt, Phœnicia, and Cœle-Syria, Lycia, Caria, Cyprus, and the Cyclades, with parts of Arabia, Libya, and Ethiopia. His son Ptolemy married Berenice, the daughter of Magas, and the province of Cyrene was thus peacefully brought back to his empire. Under Ptolemy Philadelphus, Egypt rose to a high rank among the nations in power and in wealth. The surname of Philadelphus was assumed by Ptolemy to indicate his great affection for his sister Arsinoë, whom he married after the death of her husband, Lysimachus. His former wife, Arsinoë, daughter of Lysimachus, was banished by him, and two of his brothers were put to death. It is with reference to this last circumstance that some have explained the name Philadelphus, as in irony. By his first wife he had two sons, Ptolemy, his successor, and Lysimachus; and one daughter, Berenice, married to Antiochus II., king of Syria. He reigned from 285 to 247 B.C.

PTOLEMY III., surnamed **EUERGETES**, succeeded his father Philadelphus, and reigned from 247 to 222 B.C. He made war on the kingdom of Syria, to avenge the death of his sister Berenice, who had been murdered at the instigation of Laodice, former wife of Antiochus. He overran all the provinces as far s. as Babylonia and Susa; those on the n. and e. as far as Bactria and India offered him homage; and he might have extended the bounds of his empire much further, had not domestic troubles compelled him to hasten back to Egypt. The treasures he brought with him were immense; and among the things most highly prized were the statues of the Egyptian gods which Cambyses had carried off to Babylon in 525 B.C. It was the restoration of these to their proper temples which gained for Ptolemy III. the title of Euergetes (the benefactor). His fleets gained many possessions on the coast of the Mediterranean, such as Pamphylia, Cilicia, and Ionia, which remained for a long time subject to Egypt, though the eastern provinces recently conquered soon returned to their former sovereign. He pushed the limits of the home-empire further s., by conquering part of Ethiopia, where he formed a colony and center of trade at Adule. Ptolemy III., like his predecessors, patronized learned men, and encouraged the study of the arts and sciences. He added so largely to the library of Alexandria that he has by some been called its founder. Among the celebrated men who adorned his court, and kept up the fame of the "museum," were Apollonius Rhodius, Eratosthenes, and Aristophanes, the grammarian. In his reign, the Egyptian kingdom reached the highest point of military glory, prosperity, and wealth.

PTOLEMY IV., surnamed **PHILOPATOR**, reigned from 222 to 205 B.C. He was the unworthy son of the preceding king. His reign began in blood by the murder of his

U. K. XII.—17

mother Berenice, his brother Magas, and his uncle Lysimachus; and it ended in blood by the violent death of his wife Arsinoë. He abandoned himself to debauchery, and intrusted the management of his kingdom to favorites. Antiochus, king of Syria, profiting by his indolence, wrested from him in war some of the provinces which his father had gained; but Ptolemy IV. at length roused from his lethargy, took the field in person, and defeated Antiochus at the battle of Raphia. When peace was concluded, Ptolemy IV. returned to his capital, and plunged with increased zest into every vice and indulgence. He died in 205 B.C., his death being hastened by his excesses. He followed the example of his father and grandfather in patronizing arts and letters, and cultivated friendship with the Romans, to whom he sent large supplies of grain during the second Punic war; but persecuted the Jews, against whom he had conceived a hatred in consequence of being refused admittance to the sanctuary at Jerusalem by the high-priest.

PTOLEMY V., EPIPHANES, succeeded to the throne of his father Philopator, when only five years of age, and reigned from 205 to 181 B.C. His dominions were invaded by Antiochus, king of Syria, and Philip, king of Macedonia, while he was still an infant, and several provinces were severed from the Egyptian kingdom; but the Romans at length interfered, and peace was concluded, it being arranged that Ptolemy V. should marry Cleopatra, daughter of Antiochus, and receive as her dowry those parts of his empire in Syria which had been taken from him. He was declared of age in 196 B.C., and his coronation was performed with unusual splendor. The decree published on this occasion is that which forms the inscription on the far-famed Rosetta stone (q.v.). Ptolemy V. married Cleopatra in 193 B.C. The affairs of the kingdom were managed by the wise and virtuous Aristomenes, and so long as Ptolemy V. followed his counsels, all went well. But the king's ear was gradually opened to insinuations against his great minister, whom he ultimately compelled to drink poison. While Ptolemy V. was preparing for an expedition against Syria, he was poisoned by some of his followers, whom he had alarmed for their own safety. Under him Egypt rapidly sank in prosperity, power, and reputation.

PTOLEMY VI., PHILOMETOR, reigned from 181 to 146 B.C. He was very young at his father's death, and the affairs of the kingdom were therefore directed by his mother Cleopatra, who acted with remarkable prudence and energy. When she died in 173 B.C., the administration fell into the hands of two worthless ministers, Eukeus and Lenaus, who, engaging in war with Antiochus, brought the kingdom to the brink of ruin. The young king was taken prisoner by Antiochus (170 B.C.), who hoped to obtain possession of the whole of Egypt; but his younger brother, also called Ptolemy, immediately declared himself sovereign under the title of Euergetes II., and took vigorous measures to defend the kingdom. By the intervention of the Romans, Antiochus was compelled to return to his kingdom. The brothers reigned jointly for some time, but at length quarreled, and a civil war ensued in which Euergetes II. was ultimately worsted. The deputies of the Roman senate, who now did as they pleased in Egypt, arranged that Ptolemy Philometor should retain Egypt proper, while Euergetes II. should obtain Cyrene as a separate sovereignty. This settlement substantially held during the lifetime of the former. Ptolemy VI. reigned 35 years, and died in 146 B.C., from injuries received by a fall from his horse in a battle against the Syrian usurper Alexander Balas. He is celebrated for his mild and humane disposition, which was strikingly evinced in his magnanimous treatment of his unworthy brother.

PTOLEMY VII., or EUERGETES II., best known by the nickname **PHYSCON,** or *Big-belly,* ascended the throne after the death of his brother. He married his brother's sister and widow, Cleopatra (who was also his own sister), and on the same day murdered her infant son Ptolemy Eupator, whom she had at first declared king. The history of his reign is one unbroken record of murder and blood, whence his subjects nicknamed him *Kakergetes* ("the malefactor"). Not only relatives who stood in his way to the throne, but those who opposed his accession, and even innocent persons, were butchered with savage cruelty. His private vices and debaucheries were equally infamous. He divorced his wife and sister Cleopatra to marry her daughter by her first husband—his own brother; and when temporarily driven from his throne, 130–127 B.C., by the indignation of his subjects, who chose the divorced Cleopatra in his room, the monster took a diabolical revenge by murdering his own and Cleopatra's son, and sending the head and hands as a present to the latter on her birthday. One is almost ashamed to add that he retained the hereditary taste for learning, and patronized learned men. He himself wrote a work of 24 books called *Memoirs (Hypomnemata)*. He reigned from 146 to 117 B.C.

Besides these, there are several Ptolemies of less note—as, for example **PTOLEMY VIII.,** or **SOTOR II.,** otherwise called **LATHYRUS** or **LATHURUS,** who reigned first from 117 to 107 B.C., and again from 89 to 81 B.C.; also **PTOLEMY IX.,** or **ALEXANDER I.,** youngest son of Ptolemy VII., who reigned from 107 to 90 B.C.; **PTOLEMY X.,** or **ALEXANDER II.,** son of Alexander I., 81–80 B.C.; **PTOLEMY XI.,** or **DIONYSUS,** or **AULETES,** an illegitimate son of Ptolemy Lathyrus, who reigned from 80 to 51 B.C.; **PTOLEMY XII.,** who reigned for some time in conjunction with his sister Cleopatra, and who was ultimately drowned in the Nile, after being defeated by Cæsar; and lastly, **PTOLEMY XIII.,** younger brother

of the preceding. Cæsar appointed him joint ruler with Cleopatra, his sister and intended wife. He died by violence in 43 B.C., at the instigation of Cleopatra.

PTOSIS (from the Gr. *pipto*, I fall) signifies a drooping or falling of the upper eyelid, and arises from palsy of the third or *motor-oculi* nerve. It may arise either from debility, in which case it may be removed by tonics; or from congestion of the brain, when it is usually accompanied with giddiness, headache, etc., and should be treated by bleeding, purgatives, and low diet; or from organic disease of the brain, in which case remedies are of little use. If it occurs without any apparent cause, and resists medical treatment, it may be removed by a surgical operation, by which the eyelid is brought under the action of the occipito-frontal muscle, which receives its nervous power from another source.

PTYCHODUS, a genus of cretaceous fish, founded on large square crushing teeth, which occur in considerable quantity in the chalk beds. The crown of the teeth are raised in the center into a number of parallel transverse ridges, and the flat margin is finely granulated. They were set, as in the Port Jackson shark, like a pavement on the borders of the mouth, and were admirably adapted to crush the shells of the crustacea and mollusca on which they fed. Large dorsal spines have been found associated with the teeth; but as no materials exist for the restoration of the external form of the fish, the analogy of their modern representative, the Port Jackson shark, alone suggests that they belonged to the ptychodus.

PUBERTY, that period of life at which sexual development takes place. It differs somewhat among different races and nations, and is also affected by the climate, taking place rather earlier between the tropics than in the temperate zones. As a general rule the period is later in those races and in those families which are long-lived, and in consequence a more perfect development is attained. It is during this interesting period of life that the nervous system, and particularly the brain, makes its most rapid growth, attaining a greater volume in the Caucasian than in any other race. It is in accordance with all that is known in biology and physiology that a certain period is required to produce a well-developed brain, and during this time the most favorable circumstances ought to attend the development, for on them depends a happy or an unhappy life, or good or bad health. There is such a wonderful tide of vitality coursing through the veins and along the nerves during these years of adolescence that under good training a fair constitution may be formed upon a defective organization; but if the subject is exposed to degenerating influences of any kind, either from vicious personal habits, or errors in diet and exercise, or exposure to malarious and poisonous atmosphere, the inheritance of the most splendid organization may be completely squandered. Too long confinement in the vitiated air of our crowded school-rooms, and to a too uniform sitting posture, it may be feared, has worked, and is working, more mischief than many who take pride in the handsome buildings and the order which reigns within them are willing to admit. Those nations who have attained a general condition of good physical and intellectual development have paid great attention to the training of their youth and maidens, but the subject has never been well enough understood.

PUBLICANI (from Lat. *publicum*, that which is public or belongs to the state), the name given by the Romans to those persons who farmed the public revenues (*ecctigalia*). These revenues were put up to auction by the censors, and were "sold" for a period of 5 years. They were derived chiefly from tolls, tithes, harbor-duties, *scriptura* (the tax paid for the use of public pasture-lands), mining and salt duties. As the state required the publicani to give security for the sum at which they had purchased the collecting of the taxes, and as this sum was usually much greater than the wealth of any single individual, companies (*societates*) were formed, the members of which took each so many shares, and were thus enabled to carry on conjointly undertakings far beyond the capabilities of the separate shareholders. Their contract with the Roman government was made in the name of a single person, who was called *manceps*, and who was held responsible for his *socii* to the state. Every *societas* had also a head-manager (*magister*), who resided at Rome, and transacted all foreign correspondence with the inferior officers who directly superintended the collection of the taxes. In general, a *societas* farmed only one branch of the revenue, but exceptions occur. Only Roman citizens were eligible as publicani, and, as a matter of course, only the wealthiest among these could become such. After the middle of the 2d c. B.C., the farming of the public revenues fell into the hands chiefly of the Equites (q.v.). By a wise regulation, no governor of a Roman province was allowed, during the period of his governorship, to have anything to do with these tax-gathering companies. The design of this was to place the governor in such a position that he could afford to act justly toward the people, who were often cruelly oppressed by the exactions of the provincial underlings—the "publicans" of the New Testament.

PUBLIC BURDENS is a phrase in Scotch law to denote the usual taxes or charges on land, in respect both of its ownership and possession. Such are the land-tax, minister's stipend, manse assessments, schoolmaster's salary, poor-rates, rogue-money, road and bridge assessments. Public burdens, where no stipulation is made to the contrary, fall upon the landlord, and not on the tenant, except in the case of schoolmaster's salary, which is equally divided between landlord and tenant.

PUBLIC DOMAIN OF THE UNITED STATES, or the lands owned by the government in trust for the people, amounted in all, including sales and grants that have been made from them to 2,912,734 sq. m., or 1,864,382,233 acres. The larger portion had not been surveyed when the government adopted the system of survey into townships 6 m. square, containing 36 "sections," each 1 m. sq., containing nominally 640 acres. Each section is subdivided by "quarter posts," midway in the side lines of the section, into quarter sections of 160 acres, in the center of the section; and these are subdivided into halves or 80 acre lots, with stakes midway in the side lines of the quarter sections. See **SURVEYS OF PUBLIC LANDS**. The n. and s. lines of the township are known as range lines, and the e. and w. as township lines. The cession of the claims of Virginia, New York, Connecticut, and New Hampshire to the lands w. of the original 13 states, embraced all the territory now occupied by the states n. of Georgia and e. of the Mississippi. The purchase of Florida from Spain, and of Louisiana from France, in 1800, confirmed a disputed title to all the region between the Mississippi river and the Rocky mountains, and even to the country now occupied by the states of Wisconsin and Illinois. The discoveries of capt. Robert Gray at the mouth of the Columbia river, and the explorations of capt. Lewis and Clarke under the direction of president Jefferson in 1804-5, gave the United States a claim on all the valley of the Columbia river, subsequently strengthened by a cession from Spain of her claims to the same region, and finally confirmed by a treaty with England, 1846, fixing the boundary on the Pacific slope at lat. 49°. Texas achieved independence from Mexico, and was annexed to the United States in 1845, by which a territory of 274,356 sq. m. was added to the area, most of which became public domain. The war with Mexico, which followed, resulted, in 1846, in the acquisition of California, and a considerable area of country now embraced in New Mexico and Arizona. The last acquisition, exceeded in area only by the cession of French Louisiana, is Alaska. Much the larger part of this national domain has been surveyed for sale, and marked in sections and quarter sections. The unsurveyed portions are mostly on the great plains between the Rocky mountains and the states bordering the Missouri, among the great mountain ranges, in the territories of New Mexico and Arizona, and the regions between the Rocky mountains and the Pacific. Even in these territories, wherever the land has invited settlement by its fertility, surveys have been ordered, and are constantly in progress.

The system of sales adopted by the government has varied considerably by the passage of successive acts to encourage actual settlers and give them preference over speculators. Formerly public lands could be located and bought to any extent anywhere at \$1.25 per acre wherever surveys had been completed. Legislation laws known as pre-emption acts now restrict sales to actual settlers, and not exceeding 160 acres to each. All public lands to which the Indian title has been extinguished are subject to pre-emption, except those reserved by proclamation of the president for some public use; Spanish or French grants; lands occupied by, or selected for, the site of a town; land occupied for purposes of trade or business, and mineral lands. Any person who makes a settlement in person, by erecting a dwelling on any unoccupied land, and lives in it, is authorized to enter with the register of the land-office of the district his claim to such land at the minimum rate of payment required; provided, that he does not own as much as 320 acres of land elsewhere in the United States; that he does not abandon the land claimed to reside on other public land in the same state or territory; nor make more than one such pre-emptive claim; and that he has never before had the benefit of such a claim. Military bounty land-warrants, and agricultural college scrip are receivable for pre-emption payments. Lands pre-empted for homesteads are relieved from liability for former debts. Sections 16 and 36 are reserved to the state for school purposes, and if pre-empted before they are surveyed and numbered, other sections instead are assured to the state. Mineral lands (except in Michigan, Wisconsin, and Minnesota) are reserved from pre-emption and sale, except under special laws. Mining claims upon veins or lodes of quartz or other rock in place bearing gold, silver, cinnabar, lead, tin, copper, or other valuable deposits, may be made 1500 ft. in length on such vein, and not exceeding 300 ft. on each side of the vein, or less, as may be limited by miners' law, authorized by congress, and of record in the local district. "Placer claims" for mineral not in rock-in place, are made in conformity to land surveys in squares not exceeding 160 acres; but if many locators claim within that limit, the tract is divisible into 10-acre squares, and no one locator is entitled to more than 20 acres, and no association of persons to more than 160 acres by right of location. All patents granted, or pre-emption, or homesteads allowed, are subject to any vested and accrued water-rights or rights to ditches and reservoirs used in connection with such water-rights and to rights of way for public highways. Grants of public lands to states or corporations reserve all mineral claims for location under special laws. Coal-mine lands or unsold public domains may be pre-empted, 160 acres by one individual, or 320 acres by an association, at \$10 per acre if not within 15 m. of a completed railroad, and at \$20 per acre if within that limit. All lands offered at public sale are sold in half-quarter sections, or 80-acre lots, to the highest bidder. Private sales are made for cash only at \$1.25 per acre, unless within the lines bounding railway grants of alternate sections, which are \$2.50 per acre. The president is authorized to reserve from the public lands, whether surveyed or unsurveyed, town sites on the shores of harbors, or any natural prospective centers of population. Section

2381-2394 of the revised statutes contain the provisions governing such lands. There are 39 land districts with established offices for the sale of government lands, each under the charge of a "register of the land-office" appointed by the president and confirmed by the senate; and 17 land survey districts, each with a public office under the charge of a surveyor-gen. similarly appointed. For public domain reserved for park see YELLOWSTONE PARK, etc.

PUBLIC HEALTH. See HEALTH ASSOCIATION; HEALTH, METROPOLITAN BOARD OF; HEALTH, MUNICIPAL BOARDS OF; HEALTH, NATIONAL BOARD OF; HEALTH, STATE BOARDS OF.

PUBLIC HEALTH ACT is an important act in England regulating sanitary matters (11 and 12 Vict. c. 63). It enabled local boards of health to be created all over England. The initiative was given to one-tenth of the rated inhabitants of cities, boroughs, parishes, and places having a defined boundary, to take proceedings to have the act applied to their district, whereupon and so to deal systematically with sewerage, drainage, water-supply, paving, lighting, watching. The general board of health first send an inspector to report, and afterward direct the act to apply. The act has been further supplemented by a family of kindred acts called the local government acts, the nuisances removal acts, the prevention of diseases acts, etc. The state of the law produced by these combined statutes is very complicated, but the result is greatly to extend sanitary improvements.

PUBLIC-HOUSES in England are known under two classes, viz., ale-houses, also called inns (q.v.), and beer-houses. The former give board and lodging to travelers, while the latter are mere shops for the sale of beer to be consumed on or off the premises.—1. An ale-house must be first licensed by the justices, before the keeper of it can sell excisable liquors to be consumed on the premises. The granting of the license may be opposed by any inhabitant. The justices' license, if new, must be confirmed by the confirming authority of other justices; and an excise license must follow, and not precede the justices' license. The license is in force for one year; and if any offense or misconduct is committed, the renewal of the license may be opposed, and refused on the next meeting. The statute compels the keeper to keep unadulterated liquor, to use only legal measures, not to permit drunkenness or unlawful games, or bad characters, to keep good order, and lastly, not to open his house, except to travelers, on Sundays during the morning and afternoon divine service. The law as to the opening of public-houses during Sunday may be varied by the country justices within certain narrow limits, and is as follows: No public-house can be opened for the sale of fermented or distilled liquors before half-past 12 at noon on Sunday, or in London before 1, or elsewhere before 1 if so ordered. It must be again shut between 3 and 6 P.M., and shut altogether at 11 P.M., in London, but at 10 P.M. elsewhere. Christmas-day and Good-Friday, but not public fast or thanksgiving days, are treated as Sundays. On week-days, such houses cannot be opened before 5 A.M., or after 12½ P.M., in London, and elsewhere before 6 A.M. and after 10 or 11 P.M. Travelers are expressly excepted from the above rule, and the decisions and statutes have settled the point that a traveler is a person who walks or drives 3 m. distance, whether for pleasure or on business. As regards public-houses, constables have the power of entering them to keep order, and it is an offense in the publican to refuse them admission.—2. Beer-houses are subject to the same rules as ale-houses on Sundays. They also now require to have certificates or licenses from justices, and so do all wine-house keepers and grocers who sell beer, wine, spirits, sweets, and any intoxicating liquor. All houses licensed for the first time after 1872, for consumption on the premises, must be of higher values than formerly—namely, £12 to £50.

In 1872 many of the previous statutes were modified by the intoxicating liquor licensing act, 35 and 36 Vict. c. 94, and in 1874 by 37 and 38 Vict. c. 49. The chief new features were to define the opening and closing of the houses on Sundays and week-days, and to allow country justices to vary these hours a little. Though travelers are still entitled at all hours to enter inns, persons are subjected to penalties for falsely pretending that they are travelers, and also for being found within licensed premises without sufficient reasons, during the hours when such houses ought by law to be closed. Any constable may enter one of these houses for cause, and demand the name and address of and persons found therein during prohibited hours, and it is an offense to give a false name and address. While the hours of opening and closing are now clearly defined, a power is given to the local justices or the metropolitan police commissioners to relax them for houses near any night-work or market. A power was also given to record convictions on the licenses, and after three convictions the keeper of the house was to forfeit his license and remain disqualified for 5 years, and even the premises themselves were to be disqualified from receiving a license for 2 years. The other chief feature was that justices were divided into two bodies for granting new licenses, one of them being a select committee to review the other, while there was no appeal allowed from the refusal to grant a license for a new inn. The justices thus had larger powers of refusal than before. The English act of 1872 applied in most respects to Ireland; and many of its provisions were made applicable to Scotland by an act passed in 1876.

In Scotland the law affecting public-houses has been considerably altered of late years, and the governing statute is now 25 and 26 Vict. c. 35. Certificates for the sale of excisable liquors must be applied for to the justices of the peace, who meet for the purpose

in April and October. The justices have a discretion in particular localities as to fixing the hours of closing within certain limits. Certificates to sell wines and spirits include power to sell beer and cider also; but they may be granted for the sale of wine, porter, ale, beer, cider, and perry only; or for beer, porter, ale, cider, and perry only; so that there are three kinds of certificates, corresponding to what exists in England. The justices' certificate also must be obtained for the spirit and wine license, before application for the excise license. The justices have power, in special circumstances, to regulate the hours of closing; but the general hours of closing in all cases are as follows: the houses shall not be open for sale or drinking before 8 A.M., nor after 11 P.M., with the exception of refreshment to travelers, or to persons lodging in the premises; and the house shall not be opened for the sale of any excisable liquors, or drinking thereof, on Sunday, except for the accommodation of lodgers and travelers. Though, however, on Sundays, travelers and lodgers only are to be supplied with drink, this is only so in the case of inns and hotels; for with regard to public-houses proper, and spirit or beer-shops, these are not allowed to be open on Sundays even to travelers or lodgers. The certificate of justices is granted on the same conditions as to good order as in England. The owner of any property in the neighborhood may object to the granting or renewing of the certificate. Constables may enter at any time eating-houses, if they suspect excisable liquors are unlawfully sold there. The chief officer of police is to report to the procurator-fiscal the places where intoxicated persons are seen frequently to issue. Persons keeping shebeens, or uncertificated places where spirits or excisable liquors are sold or drunk, are punished heavily, and also the persons found drunk there may be fined 10s. The main difference between English and Scotch inns and public-houses is the shutting up these for the whole Sunday in Scotland. In both countries travelers are excepted; and the same definition will and ought to be given to that word in both countries, and there is a penalty imposed in Scotland of £5 on any person who falsely represents himself to be a traveler, so as to procure entertainment and drink in an inn; as there now is also in England, where the burden of proof that the person served is a traveler is thrown on the publican; yet, if the latter take all precautions to ask and satisfy himself on the point, English statutes have now decided that he incurs no penalty. The policy of these restrictions on the opening of inns and public-houses on Sunday has been much discussed of late years.

PUBLICOLA, **PUBLIUS VALERIUS**, a Roman consul, described by Livy and Plutarch as a magnanimous patriot. Having witnessed the suicide of Lueretia and sworn to avenge the outraged matron, he bore a chief part in expelling the Tarquins, and foiled the attempts of the family to regain the crown. After the death of his colleague Junius Brutus, having heard of the suspicions of the people that he was aiming at despotic power, he took measures to remove the apprehension. He demolished in the night a palatial edifice which he had reared, and ordered that the fasces which were carried before him as the emblem of power should be lowered when he came before the people. Stringent laws were enacted to protect the liberties of the citizens. It was decreed that convicts should have the right of appeal from the consuls to the people, and that whoever attempted to be king might be slain by any man at any time. For his services he was raised to the highest place of honor. The surname of *Publicola*, "friend of the people," was conferred upon him and his descendants forever. He was thrice elected consul. On his death, 503 B.C., he was buried at public expense, and lamented by Roman matrons for 10 months.

PUBLIC PROSECUTOR. See **PROSECUTOR**.

PUBLIC SCHOOLS. See **SCHOOLS**; **NATIONAL EDUCATION**, *ante*; **COMMON SCHOOLS**.

PUBLIUS, **SYRUS**, a native of Syria; brought to Rome when a boy as a slave; but his master was kind, educated him, and finally gave him his freedom. He excelled in writing mimes, which were in great vogue at Rome in the latter times of the republic. Julius Cæsar gave him the preference over all other mimographers. His works are lost, but some of his moral apothegms, which have been preserved by Seneca and other ancient writers, are remarkable for their laconic precision and justness of sense. They have been collected and printed at the end of some editions of Phædrus.

PUCGINIA, a genus of fungi, of the division *coniomycetes*, all very small and parasitic, on the leaves or stems of plants, within the tissue of which the mycelium creeps. One of the most common species, and the most important, is the **CORN MILDEW** (*P. graminis*), which is almost always present in corn fields, and in some years is very injurious to wheat and other cereal crops. It is pitchy brown or black, and grows in irregular lines, somewhat following the venation of the leaf, the lines sometimes confluent. The spores are supposed to find their way from the root upward, with the juices of the plant on which they vegetate, but this has not yet been proved by observation.

PUCCOON, a name applied in America to several kinds of plants or the colored juices which they yield. In the s. it is applied to *sanguinaria* (q.v.); in the s.w. to certain species of borage, as *lithospermum hirtum* (hairy puccoon), and *L. canescens* (hoary puccoon or alkanet). The yellow puccoon, otherwise called Indian dye, Indian turmeric, yellow root, orange root, and golden seal, is *hydrastis Canadensis*, a member of the crow-foot family (*rannunculacea*). This perennial herb is indigenous to Canada and the United States e. of the Mississippi river, growing in rich woodland; confined to the mountainous

districts in the south. It has a low stem, and near the summit two heart-shaped leaves and a single greenish-white, apetalous, terminal flower, the sepals of which soon fall from the calyx, leaving numerous stamens and a cluster of twelve or more pistils, the ovaries of which form a bright crimson compound berry, resembling a raspberry or a blackberry in its crimson immature state. There is only one species in New York and westward. A decoction or a poultice of the root was used by the Indians as a stimulant-dressing to ulcers, and also as a dye. It has also been vaunted as a remedy for various affections, as intermittent fever, cancer, leucorrhœa, and ophthalmia, and recently it has been claimed to be serviceable in uterine hemorrhage and in dysmenorrhœa. It is, however, not much relied upon by experienced medical practitioners.

PÜCKLER-MUSKAU, HERMANN LUDWIG HEINRICH Prince von, 1785-1871; b. Germany; educated at Leipsic, and entered the army. He traveled extensively in Europe and Asia. Among his works are *Briefe eines Verstorbenen*, 1830-31; *Tutti Frutti*, 1834; and *Aus Mehemet Ali's Reich*, 1844. He was made prince in 1822.

PUD, or **POOD**, a Russian weight which contains 40 Russian pounds—almost equivalent to 36 English pounds avoirdupois.

PUDDING, although a word in such common use, and so generally understood, is very difficult to define, for there are few preparations of cookery so varied. It may be considered one of the national dishes of Great Britain; in no other country is it used so extensively by all classes of the people. The plum-pudding is the glory of an English table, and is regarded as an essential on all festive occasions. Puddings are either made of dough simply boiled in a cloth or basin, and with or without other materials; or they may be made of a batter of flour, or other farinaceous material, and water, and poured into the pudding-cloth and boiled; or into a dish and baked. It is common also to make fruit and meat puddings, by rolling out dough or paste into large flat sheets, and inclosing the fruit or meat entirely in them, and then tying them up in the pudding-cloth and boiling them. These are the general characters of this dish, but the recipes for varying the details are innumerable.

PUDDING-STONE, a rock composed of water-worn pebbles, cemented together by a firm paste. It is now more generally known as conglomerate (q. v.).

PUDDLING, a process by which wells, ponds, canals, etc., are lined with clay or loam impervious to water. See **EMBANKMENT**.

PUEBLA, a state in s. e. Mexico, between 16° 20' and 20° 15' n. lat. and 97° and 99° 15' w. long.; bounded by Vera Cruz on the n. and e., by Mexico, Tlascala, and Hidalgo on the w., by Oajaca on the s. and by Guerrero on the s. w.; 12,015 sq. m.; pop. '69, 697,788. The principal river is the Cordillera. The country belongs in great part to the Anahuac table-land, and within its bounds is the volcano Popocatepetl, the highest mountain in the republic. The chief exports are grain, fruit, sugar, cotton, silver, marble, and alabaster. There are manufactures of glass, steel, iron, and other articles. The chief towns are La Puebla, Tehuacan, and Cholula. There are many ancient ruins of great interest.

PUEBLA, or **PUEBLA DE LOS ANGELES**, a city of Mexico, capital of a state of the same name, stands on a fruitful plain, 7,381 ft. above sea-level, and 76 m. e. s. e. of the City of Mexico. In the vicinity are Orizaba, Popocatepetl, and other lofty mountains. It was founded in 1531, and is one of the most populous, as well as one of the most industrious cities in the empire. Its streets are regular, broad, and well paved. The houses, which are frequently three stories in height, are flat-roofed, covered with variously colored tiles, and profusely ornamented, both inside and out, with fantastic paintings resembling frescos. There are 44 fountains, and the water is supplied by means of an aqueduct. It contains 72 churches, 9 monasteries, 11 convents, and 23 theological colleges. On the great square stands the cathedral, an imposing building, the interior of which is decorated in the most sumptuous manner with ornaments of gold and silver, paintings, statues, etc. Among the numerous educational institutions, there are several of the highest class. There are also hospitals, the government and the bishop's palaces, charity schools, and other benevolent institutions. The more wealthy inhabitants are accomplished, refined, and benevolent; but the lower classes are esteemed the most demoralized in the empire. Glass, earthenware, soap, woolen fabrics, and sword-blades are manufactured. Pop. 70,000. After a siege of three months, Puebla surrendered temporarily to the French in May, 1863. See **MEXICO**.

PUEBLO, a co. in s. e. central Colorado, drained by the Arkansas, Greenhorn, and Huerfano rivers, and Squirrel and Fontaine qui Bouille creeks; traversed by the Atchison, Topeka, and Santa Fé and the Denver and Rio Grande railroads; about 2,200 sq. m.; pop. '80, 7,615—6,718 of American birth. The surface is hilly. The soil is fertile. The principal productions are corn, wheat, oats, and live stock. Co. seat, Pueblo.

PUEBLO INDIANS, the name given by the Spaniards and afterward by the Americans to a number of Indian tribes living in villages (*pueblos*) in the present New Mexico. They were composed of a number of tribes speaking different languages. The existing tribes are Jemes, Queres, Toltos, Tegnas, and Zuñis. They number about 7,000 persons. The Mexican government recognized them as citizens, and in 1857 it was decided

that they were citizens of the United States; but they are not allowed to vote by the statutes of New Mexico. They live in 19 pueblos, each of which has its elective governor and a court composed of three old men. They live in houses of adobe, sun-dried brick, or stone, each containing several families. They are Roman Catholics, and several schools are supported among them.

PUPERAL FEVER is the most fatal disease to which women in childbed are liable. It has been described under various other names than that which is now assigned to it—as *childbed fever*, *peritoneal fever*, etc. A careful investigation of the records of more than two centuries shows that the disease prevails epidemically, and that it is more virulent in lying-in hospitals than in private practice. The essential nature of the disease is a subject that has led to the expression of many different opinions. The views that it is (1) *inflammation of the uterus*, (2) *inflammation of the omentum and intestines*, (3) *peritonitis, either alone or connected with erysipelas*, (4) *fever of the special nature*, (5) *disease of a putrid character*, or (6) *a disease of a complicated nature*, have all been advocated by physicians of high reputation; and prof. Seanzoni, one of the highest German authorities in the department of midwifery, maintains that the disease originates in an altered condition of the blood, and consists mainly in the presence of pus in that fluid. This variety of views is doubtless, in a great measure, due to the varied characteristics of different epidemics. When a disease is epidemic, it is always difficult to ascertain whether it is contagious; but in the case of puerperal fever, there is an overwhelming amount of evidence, not only that the virus can be carried by the practitioner from one parturient woman to another, but from various other morbid sources; the peculiar condition of childbirth, and possibly certain atmospheric conditions, rendering the mother peculiarly susceptible of such contagion. Numerous series of fatal cases have been traced back to the medical man or nurse having immediately before been in attendance on a case of erysipelas, of sloughing sores, of gangrene, or of typhus fever. It is the opinion of Rokitsansky and others that the morbid matter acquired by the dissection of subjects not dying from this disease, may excite the disease, in a patient shortly afterward delivered by the dissector; and there is no doubt that any one who assists at the *post-mortem* examination of a puerperal patient, becomes, as it were, a focus of intense contagion. Considering the extreme severity and undoubted contagious nature of this disease, the practitioners and nurses who come in contact with it should wash their hands either with a weak solution of chlorine (which has been found of great service in destroying the contagion in the great lying-in hospital at Vienna), or in a solution of chloride of lime, as well as with soap and water. Moreover, persons much engaged in midwifery would do well not to take any part in *post-mortem* examinations, especially when the death resulted from this disease; and when of necessity they are present, they should wear a special dress for the occasion, and take every precaution as to ablution.

Puerperal fever occurs in such varied forms that numerous divisions or species of it have been suggested. The late Dr. Gooch, one of the highest authorities on this subject, divided puerperal fever into (1) the *inflammatory* and (2) the *typhoid*; while Dr. Robert Lee and Dr. Ferguson (two of the chief authorities) make four divisions.

Inflammatory puerperal fever is most commonly due to peritonitis, but may depend upon inflammation of the uterus, the ovaries, and uterine appendages, the uterine veins, etc. The ordinary symptoms, in the most common form (namely, when there is peritonitis), are rigors, followed by heat of skin, thirst, flushed face, quickened pulse, and hurried respiration. The abnormal heat of the skin soon subsides, and is followed by nausea, vomiting, pain in the region of the womb, commencing at one spot, and extending over the abdomen. This pain increases as the inflammation extends, till the patient presents the symptoms described in the article PERITONITIS. The pulse is uniformly high; the tongue coated; the urinary secretion diminished, and often passed with difficulty; while the intellectual faculties are rarely affected. Five or six days are the average duration of this disease, which may prove fatal on the first day, or may extend to 10 or 11 days. In some epidemics (as, for example, in Paris, in 1746; in Edinburgh, in 1773; and in Vienna, in 1795), none recovered. Dr. Ferguson states, that "to save two out of three may be termed good practice in an epidemic season." The treatment so closely resembles that which is required in ordinary acute peritonitis (q.v.), that it is unnecessary to enter into any details regarding it.

Typhoid or malignant puerperal fever may commence in various ways, but is always accompanied with fever of a low typhoid character, and with the symptoms which usually are associated with such fever. Treatment is of little or no avail, and the patient usually sinks at the end of a few days, or even hours.

PUPERAL MANIA comprehends many forms and degrees of mental derangement. In the experience of Esquirol, these forms presented the following proportions: of 92 cases, 49 exhibited symptoms of mania; 35, those of monomania; and 8, those of dementia. The points of agreement between these widely-differing moral phenomena are, that they occur during some stage of child-bearing, and that they can be traced to physical, but not necessarily common physical causes. Insanity is developed either during pregnancy, shortly after parturition, or during nursing. Under whatever circumstances the malady may arise, it is one of exhaustion, debility, and prostration; and

this is nearly equally true, whether it be characterized by depression, languor, and passiveness, or by extreme excitement and violence. The latter are the features by which it is generally recognized, and which have justified the name by which it is generally known. The similarity to ordinary frenzy is great: there is the same watchfulness, fury, incoherence, the same vitiation of the secretions, and emaciation; and the chief differences between these affections consist in puerperal insanity being invariably traceable to disturbance of the circulation, or to animal poisoning, and in the short duration of the great majority of cases. The prognosis is in fact, so favorable, recourse to seclusion in an asylum so painful, that it has been proposed to treat all such cases at home, or that a distinct hospital or sanatorium should be established exclusively for them. When it is stated that a physical cause may be detected in the puerperal condition, this must not be construed as excluding the psychical elements which enter into the production of all such affections. Thus, it was found by Macdonald, that of 66 cases, only 6 could be attributed to a purely physical origin; and that in the majority, fright, or anxiety, or anger had formed the last or principal of that series of conditions which culminated in alienation. It not merely affects feeble and hysterical females more than others, but in a marked manner those belonging to tainted families. Of 66 patients in the Bloomingdale asylum, 17 labored under a hereditary tendency to mental disease. As connected with this point, it may be mentioned that unmarried are more liable to the disease than married women, in the proportion of 11 to 2. This great disparity may partly be explained by the fact that the fallen and unfortunate are, more than any other class of females, compelled to seek shelter in those institutions from which such statistics are obtained.—Reed on *Symptoms, Causes, and Treatment of Puerperal Insanity*; Marcé, *Folie des Femmes Encintes, des Nouvelles Accouchées et des Nourrices*.

PUERTO BELLO, a small decayed seaport t. of the United States of Colombia, on the northern shore of the isthmus of Panama, and 40 m. n. of the town of that name. It is surrounded by mountains, has an excellent harbor, is very unhealthy, and has fallen into decay since 1739, when it was stormed by admiral Vernon, during the war between England and Spain. Pop. 3,500.

PUERTO-CABELLO, or PORTO-CABELLO, a t. of Venezuela, in the province of Caracas, 78 m. w. from Caracas. It stands on an island in the Golfo Triste, separated from the mainland by a channel so narrow as to be crossed by a bridge. The situation is very unhealthy, but the harbor is safe and commodious; its imports in 1877 amounted to £1,171,522; exports, £1,535,757. Puerto-Cabello is the port of Valencia, which is about 20 m. inland. Pop. '73, 8,467.

PUERTO DE SANTA MARIA (usually called EL PUERTO, the port), a seaport of Spain, in the modern province of Cadiz, stands at the mouth of the Guadalete, in a most fertile district, on the bay of Cadiz, 6 m. n.e. of the city of that name, and 9 m. by railway s.w. of Xeres. Suspension-bridges cross the Guadalete and the Rio de S. Pedro. The mouth of the Guadalete forms the harbor, but the bar is dangerous and much neglected. Puerto de Santa Maria, a pleasant and well-built town, resembling Cadiz in its houses, and containing only one long and handsome street, while the others are narrow and ill-paved, is the port for the shipment of Xeres wines. The wines are lodged in numerous *bodegas*, or wine-stores, lofty buildings built with thick walls and narrow windows, in order to secure an even temperature inside. This town vies with Cadiz and San Lucar as a wine-exporting place; the principal exporting houses are English or French. The bull-fights which take place here in May are among the most famous in the country. Steamers ply frequently between this town and Cadiz, and Puerto de Santa Maria supplies that city with drinking-water at a cost of several thousand pounds a year. Pop. 21,278.

PUERTO PRINCIPIÉ, SANTA MARIA DE, an important inland town, in the e. of the island of Cuba, about 325 m. e.s.e. of Havana, and 45 m. s.w. of its port, Las Nuevitas, with which it is connected by railway. Pop. 30,000.

PUERTO RICO, an island in the West Indies, belonging to Spain, is one of the Greater Antilles, and lies e. of Hayti or St. Domingo, lat. 17° 55'—18° 30' n., long. 65° 39'—67° 11' w. It is in size somewhat less than Jamaica, being fully 100 m. from e. to w., 40 m. from n. to s., and closely resembling a rectangle in shape. The island is traversed from e. to w. by a range of mountains, 1500 ft. in average height, though rising in one peak to 3,678 ft. above the sea. From the base of the mountains, rich alluvial tracts extend to the sea, and there are numerous well-wooded and abundantly watered valleys. The soil is remarkably fertile. The principal crops are sugar, coffee, and tobacco of the finest quality, and cotton remarkable for its length of fiber, tenacity, and whiteness. Cattle and sheep are extensively reared, of a quality superior to any others in the West Indies. The imports consist of cotton, woolen, linen, silk, and embroidered goods, metals, hardware, and provisions, as ale, porter, fruits, wines, etc. The exports are sugar, tobacco, coffee, cotton, molasses, rum, hides, and cattle. The chief ports are San Juan, commonly called Puerto Rico, in the n.e., Ponce in the s.w., and Mayaguez in the west. Puerto Rico is one of the coolest and healthiest places in the West Indies. Area, 3,600 sq. m.; pop. 625,000, of whom 338,000 are whites. Of the colored race, 20,000 were still slaves in 1871. The value of the annual exports is over £3,000,000; of

the imports, £3,500,000. In 1875, 1,500,000 cwts. of sugar, and 200,000 cwts. of coffee were exported. The trade is mainly with Britain, but owing to duties and port charges, it is carried on in Spanish bottoms.

The frequent changes in the executive government of Puerto Rico do not appear to affect its commercial stability. The commerce of the island is almost wholly in the hands of foreigners and Spaniards from the peninsula. The preliminary act of emancipation, which came into operation at the beginning of 1871, decreased the number of slaves by 100,000. The slave-trade was already extinct; and in 1873 slavery was entirely swept away. There is a unanimous feeling against any immigration of laborers, whether Chinese, coolies, or others. A deep-sea cable now unites Puerto Rico with Europe, America, and the other Antilles; railways, irrigation, drainage, etc., are still things in embryo. It is remarkable that, notwithstanding the fertility and healthiness of Puerto Rico, the poverty of the island flora and fauna is very great; there are hardly any flowers, birds, or wild animals.

PUFF-ADDER, *Clotho arietans*, a serpent of the family *viperidæ*, having a short and broad flat head, with scales so sharply keeled as to end in a kind of spine. It is one of the most venomous and dangerous serpents of s. Africa. It attains a length of four or almost five ft., and is thick in proportion to its length, often as thick as a man's arm. Its head is very broad; its tail suddenly tapered; its color brown, checkered with dark-brown and white; a reddish band between the eyes; the under parts paler than the upper. Its movements are generally slow, but it turns very quickly if approached from behind. Its usually creeps partially immersed in the sand of the s. African deserts, its head alone being completely raised above ground. When irritated it puffs out the upper part of its body, whence its name. The puff-adder is easily killed by the oil, or even by the juice of tobacco. Its poison is used by the Bosjesmans for their arrows. S. Africa produces several other species of *clotho*, similar in their habits to the puff-adder, and almost equally dangerous.

PUFFBALL *Lycoperdon*, a Linnæan genus of *fungi*, now divided into many genera, belonging to the section *gasteromyces*, and to the tribe *trichospermi*. They mostly grow on the ground, and are roundish, generally without a stem, at first firm and fleshy, but afterward powdery within; the powder consisting of the spores, among which are many fine filaments, loosely filling the interior of the *peridium*, or external membrane. The *peridium* finally bursts at the top, to allow the escape of the spores, which issue from it as very fine dust. Some of the species are common everywhere. Most of them affect rather dry soils, and some are found only in heaths and sandy soils. The most common British species is *L. gemmatum*, generally from one to two and a half in. in diameter, with a warty and mealy surface. The largest British species, the GIANT PUFFBALL (*L. giganteum*), is often many feet in circumference, and filled with a loathsome pulpy mass, when young; but in its mature state, its contents are so dry and spongy that they have often been used for stanching wounds. Their fumes, when burned, have not only the power of stupefying bees, for which they are sometimes used, in order to the removal of the honey, but have been used as an anæsthetic instead of chloroform. The same properties belong also to other species. Some of them, in a young state, are used in some countries as food, and none of them is known to be poisonous.

PUFF-BIRD. See BARBET.

PUFFENDORF, SAMUEL, son of a Lutheran clergyman, was b. in 1632 at Chemnitz, in Saxony. He received the early part of his education at Grimma; whence he removed to the university of Leipsic. There he studied theology for several years. In 1656 he went to the university of Jena, where he seems to have devoted himself at first chiefly to mathematics, and subsequently to the study of the *Law of Nature*, as he, and others who have treated on the same subject, have termed the law which regulates the duties of men to one another, independent of the mutual obligation which is enforced by political government, or by revelation of divine will. After quitting Jena, he was appointed tutor to the son of the Swedish ambassador at Copenhagen. Soon after he had received this appointment, a rupture having taken place between Denmark and Sweden, Puffendorf was detained as a prisoner in the Danish capital. The power of his mind here showed itself in a remarkable manner. Deprived of books and of society, he threw himself vigorously into meditating on what he had formerly read in the treatise of Grotius, *De Jure Belli et Pacis*, and in the writings of Hobbes on the principles of general law. The result was the production of the *Elementa Jurisprudentiæ Universalis*—a work which was the foundation of its author's fortune. It was dedicated to the elector Palatine; and by this prince, Puffendorf was appointed to the professorship of the law of nature and nations at the university of Heidelberg. He now gave his attention to the tissue of absurdities which existed in the constitution of the Germanic empire. As was to have been expected, the work (*De Statu Reipublicæ Germanicæ*, 1667), in which he exposed the defects of the system, raised a storm of controversy. Austria was especially furious. Puffendorf had taken care to publish it under a pseudonym—that of Severinus a Mozambano, but still, to avoid the possible consequences, he accepted an invitation from Charles XI. of Sweden, in 1670, to become professor of the law of nations at Lund. During his residence there, he published the

work on which his fame now principally rests, *De Jure Nature et Gentium*. He then removed to Stockholm, where the king of Sweden made him his historiographer, with the dignity of a counselor of state. In his official character, he published a very uninteresting history of Sweden, from the expedition of Gustavus Adolphus into Germany to the death of queen Christine. In 1688, the elector of Brandenburg invited him to Berlin to write the history of his life and reign. Puffendorf accepted the invitation, and executed the required work in 19 dreary volumes. His intention was to have returned to Stockholm, but death overtook him at Berlin in 1694. Puffendorf lacked the genius to render the subjects on which he wrote generally interesting, but his intellectual power was nevertheless very considerable, and it appears to have throughout been honestly exercised with unflagging industry.—See Jenisch's *Vita Puffendorfi* in the *Memoirs of the Academy of Stockholm*, 1802.

PUFFIN, *Fraterculi*, a genus of birds of the auk (q.v.) family, *alcadae*, having the bill shorter than the head, very much compressed, its height at the base equal to its length, the ridge of the upper mandible as high as the top of the head, both mandibles arched, and transversely grooved. The bill gives to the birds of this genus a very extraordinary appearance. They have short legs, very short tail, and short wings; their legs are placed far back, and they sit very erect, like auks and penguins, resting not merely on the foot, but on the tarsus. Notwithstanding their shortness of wing, they fly rapidly, although they seem incapable of long-sustained flights. They swim and dive admirably. The best known and most widely distributed species is the COMMON PUFFIN (*F. arctica*), a native of the arctic and northern temperate regions, breeding not only in high northern latitudes, but as far s. as the coast of England, and migrating from the colder regions in winter, when it is to be found even on the coasts of Spain and Georgia. The puffin is a little larger than a pigeon; the forehead, crown, back of the head, a collar round the neck, the back, wings, and tail are black, the other parts of the plumage white. The puffin lays only a single egg, sometimes in a rabbit burrow, but more frequently in a borough of its own, which often extends three feet, and is not unfrequently curved; sometimes in deep fissures or crevices of cliffs. Great numbers congregate together, and their chosen breeding places are crowded with them. These are mostly on unfrequented islands and headlands, where there is some depth of soil. In some of them, the ground is covered by puffins, old and young, in thousands. The eggs are sought after by fowlers, and also the young birds, the flesh of which is used for food. The Scilly isles were held in the 14th c., under the king as earl of Cornwall, by Ranulph de Blacminster, for an annual payment of 6s. 8d., or 300 puffins at Michaelmas. The puffin is also known by the name *coulterneb*, and on the e. coast of Scotland it is familiarly called *tamaïenorie*. Their food consists of small crustaceans and fishes. Other species are found in different parts of the world; one in Kamtchatka, the Kurile islands, etc., with two silky tufts of long feathers on its head.—The name puffin is given in France to the *shearwaters* (q.v.), or *puffin petrels*, the genus *puffinus* of some ornithologists.

PUG, or **PUG-DOG**, a kind of dog much like the bull-dog in form, and in particular, in its much abbreviated muzzle. The nose is often a little turned up. The disposition is, however, extremely unlike that of the bull-dog, being characterized by great timidity and gentleness. Pug-dogs are only kept as pets. They are often very affectionate and good-natured, bearing without resentment the roughest handling to which children can subject them. They are all of small size. The common English pug is usually yellowish with a black snout, the tail firmly curled over the back. New breeds have of late been introduced from China and Japan, interesting from their peculiar appearance, gentleness, and docility, with extremely short *puggish* muzzle; the Chinese breed very small, with smooth hair; the Japanese rather larger, with an exuberance of long soft hair and a very bushy tail.

PUGATCHEFF, YEMELYAN, 1726-75; b. Russia; fought against the Prussians in the seven years' war, and in the campaign against Turkey in 1769. On his return he was put in prison for alleged revolutionary attempts. In personal appearance he very much resembled Peter III., and on his release he pretended to be that sovereign, and declared his purpose of reasserting his right to the crown and of dethroning Catharine II. He issued a proclamation in the name of Peter III. in 1773, and the same year the rebellion began. He succeeded in capturing the fortress of Yaitzkoi, attached to his cause the Raskolniks, whose religion he embraced, and won over several Finnish and Tartar tribes, and a large number of the peasantry. After the capture of many fortresses on the Ural and the Don, he marched against Moscow, but was sold by some of his companions for 100,000 rubles. His insurrection is said to have cost 100,000 lives.

PUGET, PIERRE, 1622-94; b. France; in youth a wood-carver on decorated ships; at 17 went to Italy, became a painter and attracted attention in Rome, but in 1643 was in Marseilles carving on ships the sculptured figures that adorned the high poops of the war-ships of those days. In 1652 he went to Rome with a priest commissioned to do some important architectural work for Anne of Austria, and took up the study of architecture. Returning to Marseilles in 1656, he designed a portal for the hotel de ville at Toulon, which established his reputation both as architect and sculptor—the caryatides exhibiting an originality and power that won him the *sobriquet* of the Michael Angelo of

France. He was soon after employed in Paris, on the new châteaux of France, and in Genoa, where he designed several churches and palaces adorned with sculpture. One of these, the "Hercule Gaulois," is now in the Louvre. He was summoned to Paris by Colbert in 1668 to be made director of naval decorations of frigates building at Toulon, which he so loaded with wooden sculptures that the naval officers complained that their comfort and the ships' service were impaired by them. When done with these, he returned to execute large architectural works at Marseilles, and then went to Paris, where he died. A special hall in the Louvre is devoted to his sculptural works, among which are the "Milon de Crotoné," and "Hercule au Repos."

PUGET SOUND, a collection of inlets on the north-western border of Washington territory, forming the southern termination of Admiralty inlet, which communicates with the Pacific by the strait of St. Juan de Fuca, s.e. of Vancouver's island. It forms a sheltered bay and harbor of about 15 sq.m., surrounded by a fertile, well-timbered country.

PUGGING, a coarse kind of plaster laid on deafening-boards between the joists of floors, to prevent sound.

PUGH, GEORGE ELLIS, 1822-76; b. Ohio; educated at Miami university, where he graduated in 1840. He was a capt. of volunteers in the Mexican war, served in the state legislature, was city solicitor of Cincinnati in 1850, attorney-general of Ohio in 1851, and was elected U. S. senator in 1855.

PUGHE, WILLIAM OWEN, 1759-1835; b. Wales; went to London at the age of 17; applied himself to the study of Welsh literature; assisted Owen Jones in editing Welsh poems. These two, in 1801, associating Edward Williams, another Welshman, with them, published the *Myrriam Archaeology of Wales*. Pughe published, 1793-1803, *The Welsh and English Dictionary*, prefaced by a Welsh grammar, containing 100,000 words; *The Cambrian Biography* in 1803; edited the Welsh magazine *Y Greal*, and translated into Welsh Milton's *Paradise Lost*, bishop Heber's *Palestine*, and other English poems. His name was originally simply William Owen.

PUGILISM, or **BOXING**, is the art of defending one's self or attacking others with the weapons which nature has bestowed—viz., fists and arms. The origin of boxing, or the use of the fists, is likely as old as man himself. We find numerous allusions to it in the classic authors. Pollux, the twin-brother of Castor in the heathen mythology, was reckoned the first who obtained distinction by the use of his fists, conquering all who opposed him, and obtaining, with Hercules, a place among the gods for his sparring talents. The ancients were not, however, satisfied with the use of the weapons of nature, but increased their power by the addition of the cestus (q.v.). With the ancients, pugilism was considered an essential part in the education of youth, and formed part of the course of training practiced in their gymnasia; it was valued as a means of strengthening the body and banishing fear; but it was practiced in public rather with a view to the exhibition of the power of endurance than for mere skillful self-defense. The earliest account we have of systematic British boxing is in 1740, when public exhibitions of professors of the art attracted general attention. Up to this period, the science of self-defense had made but little progress, and strength and endurance constituted the only recommendations of the practitioners at Smithfield, Moorfield, and Southwark fair, which had long had booths and rings for the display of boxing. Broughton, who occupied the position of "champion of England," built a theater in Hanway street, Oxford street, in 1740, for the display of boxing; advertisements were issued announcing a succession of battles between first-rate pugilists, who never quitted the stage till one or other was defeated, the reward of each man being dependent upon, and proportioned to, the receipts. Broughton was for 18 years champion of England, and with him commences the first scientific era of pugilism. He propounded some rules for the regulation of the ring, and these remained in authority till 1838, when they were materially altered. Rule 1 is, that a square of a yard be chalked in the middle of a stage, and that in every fresh set-to after a fall, the seconds are to bring their men to the side of the square, and to place them opposite each other, and until this is done, it is not lawful for one to strike the other. Rule 2, that if either of the combatants is unable to be brought up to the square within 30 seconds after a fall and the close of a round, he shall be deemed a beaten man. No man is permitted to hit his adversary when he is down, or to seize him by the breeches, or below the waist, and a man on his knees is to be reckoned down. These rules laid the foundation of fair play, and robbed boxing of half its horrors. To Broughton also is due the introduction of gloves for "sparring-matches," where lessons could be taken without injury. The greatest professor of the art was Jackson, who was champion in 1795. He was not only the most scientific boxer of his day, but he gave his art such a prestige and popularity that half the men of rank and fashion of the period were proud to call themselves his pupils. He opened rooms for the practice of boxing in Bond street, and for years these were crowded by men of note. His "principles of pugilism" were, that contempt of danger and confidence in one's self were the first and best qualities of a pugilist; that in hitting, you must judge well your distances, for a blow delivered at all out of range, was like a spent shot, and valueless; that men should fight with their legs, using all possible agility, as well as with

their hands; and that all stiffness of style and position was wrong. Jackson is still regarded as the best theorist on the "noble art," and since his time, it has received no essential improvement. Shaw, the life-guardsmen, who immortalized himself at Waterloo, was a pupil of his, and the prowess which he so brilliantly displayed on that occasion, was owing as much to his scientific training as to his great strength. At this period, pugilism was actively supported by many persons of high rank—the dukes of York and Clarence, the earls of Albemarle, Sefton, etc., lords Byron, Craven, Pomfret. In 1814, when the allied sovereigns were in England, among other entertainments, a "sparring" display was provided under Jackson's management; and the distinguished foreigners expressed the great gratification they had experienced from the exhibition of so much science and fine physical development. Besides Jackson, Belcher, Guley, and Critch were noted champions at this period. George IV. was a stanch patron of boxing in his youth, and although he discontinued by his presence to give countenance to the sport, frequent indications were observable of his desire for its promotion. At the time of the coronation, when the popular feelings were much enlisted in behalf of queen Caroline, who was excluded from the throne, a body of pugilists were employed to preserve order; and so well did these men perform their duties, that the king presented each man with a gold medal, to commemorate the event, and to show his satisfaction. This period may be termed the "palmy days of the ring;" and from various causes, its decline has since then been uninterrupted. Among other causes, several cases occurred of prize-fighters who were tempted to lose fights on which large sums had been staked, and to deceive their most influential backers. The more distinguished patrons of the ring gradually seceded; the "pugilistic club," which had been established in 1814, and which included all the aristocratic patrons of the ring, was broken up. The magistracy of the country set their faces against the lawless assemblies of "roughs" and pickpockets who latterly formed the greater part of the spectators at prize-fights. The electric telegraph, and the establishment of an efficient rural police, have given the finishing touches to an already expiring profession. Matches can now only be got up by stealth, and the place of meeting is kept a profound secret to the last moment, for fear of interruption. A few years ago, however, the international combat between Tom Sayers, the Englishman, and John Heenan, the American, revived for a moment public interest in the art; but apart from exceptional matches, the popular feeling is that prize-fighting should not be countenanced, and we may look for its gradual extinction. The art of boxing, as an active and healthy exercise, is likely to be maintained; and the display of science between two accomplished boxers is very interesting, while it is deprived of all the horrors of the prize-ring; the rapidity of the blows, the facility with which they are mostly guarded or avoided by moving the head and arms; the trial of skill and maneuver to gain a trifling advantage in position, all give a wonderful interest to the spectator, who can watch the perfection of the art devoid of the brutalities of the ring. The pugilists of the present day are mostly publicans; their friends and the patrons of the "fancy" meet at their houses for convivial evenings, sparring-matches, ratting, and the like. It has constantly been urged in defense of pugilism that, were it abolished, the use of the knife would increase, and Englishmen would lose their present manly system of self-defense. This may be true, if the use of the fist in self-defense depended on the mercenary exhibition of pugilistic encounters, which, however, is mere assumption.—The best authority on the subject of pugilism is *Fistiana*, 1868, office of *Bell's Life*.

PUGIN, AUGUSTIN WELBY NORTHMORE, 1811–52; b. England, 1812; son of Augustus Pugin, a well-known draftsman of Normandy. In 1830 he joined the Roman Catholic church and devoted himself to reviving church architecture in England. He was an admirer of the Gothic style and advocated its general adoption. He wrote a large number of treatises on church architecture and kindred subjects; among them *An Apology for the Revival of Gothic Ornament*, *Principles of Pointed or Christian Architecture*, and *Examples of Gothic Architecture*. He was a victim of religious monomania in the latter part of his life.

PUGIN, AUGUSTUS, 1769–1832; b. Normandy; removed to London, where he was at first employed as a draftsman. He soon began to make architectural drawings for engravings, and among his first works were the buildings in Aekerman's *Microcosm of London*, 1801. He afterward studied mediæval architecture, and published, 1821–23, *Specimens of Gothic Architecture*. In 1824, in conjunction with John Britten, he published *Architectural Illustrations of the Buildings of London*; and 1825–28, *Specimens of the Architectural Antiquities of Normandy*. In this, his best work, he was assisted by his son, as also in his *Gothic Ornaments*, 1831.

PUGIN, EDWIN WELBY, 1834–75. b. England; son of Augustin Welby Northmore. He finished a number of his father's works, and designed many, including the Carmelite church at Kensington, and the Queenstown cathedral.

PUJOL, ABEL DE. See ABEL DE PUJOL.

PULASKI, a co. in central Arkansas, drained by the Arkansas river, bayou Metoc and Maumelle creek, traversed by the Memphis and Little Rock, the Little Rock and Fort Smith, and the Cairo and Fulton railroads; about 900 sq.m.; pop. '70, 32,066—30,370 of American birth, 5,948 colored. The surface is level or hilly, and heavily

timbered. Iron, granite, limestone, and slate are found. The soil is fertile. The principal productions are cotton, corn, and live stock. Co. seat, Little Rock.

PULASKI, a co. in s. central Georgia, drained by the Ocmulgee and Little Ocmulgee rivers, and traversed by the Brunswick and Macon railroad; 420 sq.m.; pop. '80, 14,058—14,022 of American birth, 8,234 colored. The surface is level and in great part covered with pine forests; corn, cotton, pork, and live stock are the staples. Co. seat, Hawkinsville.

PULASKI, a co. in s. Illinois, bounded on the s.e. by the Ohio river, drained also by the Cache river; traversed by the Illinois Central, and the Cairo and Vincennes railroads; about 190 sq.m., pop. '80, 9,507—9,146 of American birth. The surface is hilly, and well-wooded. The soil is fertile. The principal productions are corn, wheat, oats, and live stock. Co. seat, Mound City.

PULASKI, a co. in n.w. Indiana; drained by the Tippecanoe river, and traversed by the Pittsburg, Cincinnati and St. Louis and the Louisville, New Albany and Chicago railroads; about 450 sq.m.; pop. '80, 9,851—8,729 of American birth. The surface is mostly prairie, and there are many oak groves; corn, wheat, hay, and wool are the staples. Co. seat, Winamac.

PULASKI, a co. in e. central Kentucky; drained by the Cumberland river and its branches, and traversed by the Cincinnati Southern railroad; 750 sq.m.; pop. '80, 21,318—21,198 of American birth; 1,196 colored. Tobacco, corn, wool, oats, and honey are the chief products. Coal and other minerals of value are found. Co. seat, Somerset.

PULASKI, a co. in s. central Missouri; drained by the Gasconade river and its creeks and intersected by the Atlantic and Pacific railroad; about 500 sq.m.; pop. '80, 7,250—6,987 of American birth. The surface is hilly and the valleys fertile; corn, wheat, pork, and live stock are the staples. Limestone is found. Co. seat, Waynesville.

PULASKI, a co. in s.w. Virginia; drained by the New river, and traversed by the Atlantic, Mississippi and Ohio railroad; 350 sq.m.; pop. '80, 8,750—8,701 of American birth; 2,452 colored. The surface is mountainous; tobacco, corn, wheat, grass, and pork are the staples. Coal and lead are found. Co. seat, Newbern.

PULASKI, CASIMIR, 1747-79; b. Lithuania; son of the patriot count Pulaski, who organized the confederation of Barr in 1768. In the same year Casimir, who had gained military experience in the service of the duke of Courland, joined enthusiastically in the movement to liberate his country. He commanded in many battles and sieges against the Russian invaders, but in 1771 was sentenced to outlawry and death, owing to an unsuccessful attempt to secure the person of king Stanislas Augustus. He escaped to Turkey, and in 1777 arrived at Philadelphia to enter the service of the United States. He first served as a volunteer; but having won distinction at the battle of Brandywine, received from congress the appointment of commander of the cavalry with the rank of brig.-gen. After serving in that capacity for 5 months, he obtained the sanction of congress in 1778 to enter the main army at Valley Forge, for the purpose of organizing an independent corps of cavalry and light infantry. This body was called Pulaski's legion, and was ordered to South Carolina. He reached Charleston in May, 1779, and attacked the British army then before the city, but was defeated. In October of the same year Pulaski commanded the French and American cavalry at the siege of Savannah, where he was mortally wounded.

PULCI, LUIGI, an Italian poet of distinguished family, was b. at Florence, Dec. 3, 1431, and devoted his life to study and to literary composition. He was one of the most intimate friends of Lorenzo de Medici and of Poliziano, from the latter of whom he derived no little assistance in the composition of his poem *Il Morgante Maggiore* (Morgante the Giant). This celebrated work, a burlesque epic (in 28 cantos), of which Roland is the hero, is a vivacious parody of the romances of Carolingian chivalry, which had become (as Pulci thought) undeserved popularly in Italy. His mocking imagination took a pleasure in turning into ridicule the combats with giants, the feats of magicians, and all the incredible adventures that form the material basis of the mediæval epic; and he manages to do it with a wonderfully pleasant and original naïveté. But although the poem is essentially heroic-comic, it occasionally contains passages of the finest pathos, in which Pulci fortunately seems to forget his design of travestyng the inventions of the *trouvères*, and comes out undisguisedly as a real poet. Moreover, in the midst of the most extravagant buffooneries, we come upon the truest and most natural pictures of manners—the vanity and inconstancy of women, the avarice and ambition of men. Pulci died in 1487. The *Morgante Maggiore* is one of the most valuable sources for acquiring a knowledge of the early Tuscan dialect, the niceties and idioms of which have been employed by Pulci with great skill. The first edition appeared at Florence in 1488, and has since been frequently reprinted. Other works of Pulci are a series of sonnets (often grossly indecent), *La Beca du Diomano* (a parody of a pastoral poem by Lorenzo de Medici); *Confessione a la San Vergine*, a novel; and some letters.—BERNARDO PULCI, elder brother of Luigi, wrote an elegy on the death of Simonetta, mistress of Julian de Medici; and a poem on the passion of Christ, and also executed the first translation of the *Eclogues* of Virgil.—LUCA PULCI, another brother, achieved some literary reputation too by his *Giostra di Lorenzo de Medici*, a

poem in honor of the success won by Lorenzo in a tournament; *Il Ciriffo Calvaneo* a metrical romance of chivalry; *Driadeo d'Ancore*, a pastoral poem; and *Epistole Eroïde*.

P'ULEX. See FLEA.

PULICAT', PALIKAT, or PALVELAKATU, a t. of British India, in the presidency of Madras, and district of Chingleput, 20 m. n. from Madras. It stands on an island in a large inlet of the sea or salt-water lake called the lake of Pulicat. This lake is about 37 m. in length from n. to s., and 11 m. in breadth at the widest. It contains a number of islands. The communication between the lake and the sea is by very narrow openings. The lake is much used as affording facilities of traffic by boats between Madras and more northern places. Pulicat was occupied by the Dutch in 1609, and became afterward the capital of their settlements on the Coromandel coast, but fell into the hands of the British in 1795.

PULKOV VA, a village of Russia, in the government of St. Petersburg, about 9 m. s. of the capital, contains a population of 600. It stands on a ridge called the Pulkova hills, which command a splendid view of St. Petersburg, and is noted for its magnificent observatory, built by the czar Nicholas, and placed under the direction of M. Friedrich Struve. For an interesting description of the observatory, see prof. C. Piazzi's Smyth's *Three Cities in Russia* (2 vols., Lond. 1862).

PULLEY, one of the mechanical powers (q.v.), consists of a wheel with a groove cut all round its circumference, and movable on an axis; the wheel, which is commonly called a *sheave*, is often placed inside a hollow oblong mass of wood called a *block*, and to the sides of this block the extremities of the sheave's axle are fixed for support; the cord which passes over the circumference of the sheave's axle is called the *tackle*. Pulleys may be used either singly or in combination; in the former case, they are either *fixed* or *movable*. The *fixed pulley* (fig. 1) gives no mechanical advantage; it merely changes the direction in which a force would naturally be applied to one more convenient. The *single movable pulley*, with parallel cords, gives a mechanical advantage = 2 (fig. 1), for a little consideration will show that as the weight, W, is supported by two strings, the strain on each string is $\frac{1}{2}W$, and the strain on the one being supported by the hook A,

FIG. 1.

the power, P, requires merely to support the strain on the other string, which passes round C. The fixed pulley, C, is only of service in changing the naturally upward direction of the power into a downward one. If the strings in the single movable pulley are not parallel, there is a diminution of mechanical advantage—i.e., P must be more than half of W to produce an exact counterpoise; if the angle made by the strings is 120° , P must be equal to W; and if the angle be greater than this, there is a mechanical disadvantage, or P must be greater than W. The following are examples of different combinations of pulleys, generally known as the first, second, and third systems of pulleys. In the first system, one end of each cord is fastened to a fixed support above; each cord descends, passes round a pulley (to the lowest of which the weight W is fastened), and is fastened to the block of the next pulley, with the

exception of the last cord, which passes round a fixed pulley above, and is attached to the counterpoise P. The tension of a string being the same in all its parts, the tension of every part of the string marked (1) in fig. 2 is that which is produced by the weight of P, consequently, as the last movable pulley is supported on both sides by a string having a tension P, the tension applied in its support is 2P. The tension of the string is therefore 2P, and the second movable pulley is supported by a force equal to 4P. It may similarly be shown that the force applied by the strings marked (4) in support of the last pulley (which is attached to W) is 8P. Hence we see, that according to this arrangement, 1 lb. can support 4 lbs., if two movable pulleys are used; 8 lbs., if there are 3 movable pulleys; 16 lbs., if there are 4 movable pulleys; and if there are n movable pulleys, 1 lb. can support 2^n lbs. It must be noticed, however, that in practice, the weight of the cords, and of the pulleys, and the friction of the cord on the pulleys, must be allowed for; and the fact that in this system all of these resist the action of the power P, and that to a large extent, has rendered it of little use in practice.—The second system is much inferior in producing a mechanical advantage, but it is found to be much more convenient in practice, and is modified according to the purpose for which it is to be used. In this system, one string passes round all the pulleys, and as the tension in every part of it is that produced by the weight of P, the whole force applied to elevate the lower block with its attached weight, W, is the weight P multiplied by the number of strings attached to the lower block; the pulleys in the upper block being only of use in changing the direction of the pulling force. This system is the one in common use in architecture, in dockyards, and on board ship, and various modifications of it—such as White's pulley, Smeaton's pulley, etc., have been introduced; but the simpler forms have been found to answer best.—The third system is merely the first system inverted, and it is a little more powerful, besides having the weight of the pulleys to support the power,

FIG. 2.

instead of acting in opposition to it, as in the former case. By this time, it will have been evident to the reader that the mechanical advantage is not produced by the pulleys, but by the strings, and that the pulleys are merely useful in keeping the strings in a certain position, changing with as little friction as possible the direction of the pull, and affording a convenient means of attaching the weight. Theoretically, the larger the number of movable pulleys in one combination, the greater is the mechanical advantage afforded; but the enormous friction produced, and the want of perfect flexibility in the ropes, prevent any great increase in the number of pulleys.

PULLMAN, JAMES MINTON, b. N. Y., 1836; graduated at the St. Lawrence divinity school in 1860; became pastor of the First Universalist church in Troy, N. Y., and in 1867 of the church of Our Savior in New York; was secretary of the general convention of Universalists in 1868; editor of the *Christian Leader* in 1869.

PULMONARIA. See **LUNGWORT**, *ante*.

PULMONATA, an order of gasteropodous mollusks, having, for the purpose of respiration, a vascular air-sac or lung, which opens by a hole under the margin of the mantle, capable of being contracted or dilated at pleasure. Some are terrestrial, some aquatic. Slugs and snails are familiar examples of the former; water-snails, or pond-snails (*Limnaea*, *planorbis*, etc.), of the latter. Most of the pulmonata are protected by a shell; in some, as slugs, the shell is internal and rudimental.

PULNEY or **PALNAI HILLS**, a range of southern India, linking the southern extremities of the eastern and western Ghats. The average height of this range is about 7,500 ft. above the level of the sea. It possesses peculiar advantages for the establishment of a sanitarium. The climate is one of the most equable anywhere to be found, the variation of the thermometer during 12 months in a closed room without a fire being observed to be no greater than between 58° and 62°. At present there are only a few European residences built on these hills.

PULO-PENANG'. See **PRINCE OF WALES ISLAND**.

PULP, a term employed to describe those very soft and succulent parts of plants, almost exclusively of fruits, which consist of cellular tissue with much juice. The pulp of a fruit is sometimes found in one part of it, sometimes in another; thus, in the peach, plum, and other drupes, it is the *mesocarp*; in the grape and gooseberry, it is developed from the placentas, and the seeds are embedded in it.

PULPIT (Lat. *pulpitum*), an elevated tribune or desk, from which sermons, lectures, and other solemn religious addresses are delivered. In great churches the pulpit is commonly placed against the wall, or in juxtaposition with a pillar or buttress. Originally it would appear to have been used chiefly for the singing, chanting, or recitation which form part of the public service, and was a kind of stage sufficiently large to accommodate two or even more chanters. For the convenience of the hearers, this stage began to be used by the bishop, priest, or deacon, for the delivery of the homily; and thus by degrees a tribune expressly suited to the latter use alone came to be introduced. In some of the older churches the *ambo* or *pulpitum* is still used for the chanting of the gospel and epistles. In Catholic churches the pulpit is generally distinguished by some religious emblems, especially by the crucifix; and the pulpits of the Low Countries and of Germany are often masterpieces of wood-carving, the preaching-place in some of them forming part of a great artistic group, as of the conversion of St. Paul, the vocation of Peter and Andrew, the temptation of Adam and Eve, and other similar subjects. The pulpit (in Arabic, *minber*) forms one of the scanty appliances of Mohammedan worship.

PULQUE, a favorite beverage of the Mexicans and of the inhabitants of Central America, and some parts of South America; made from the juice of different species of *agave* (q. v.), which is collected by cutting out the flowering-stem from the midst of the leaves in the beginning of its growth, and scooping a hole for the juice. From this cavity large quantities of juice are removed daily for months. The juice is an agreeable drink when fresh, but is more generally used after fermentation, when it has a very pleasant taste, but a putrid smell, disgusting to those unaccustomed to it. Pulque is retailed in Mexico in open sheds called *pulquerias*, which also serve for dancing-rooms. When mixed with water and sugar, and allowed to ferment for a few hours, it forms a beverage called *tepache*. A kind of spirit is also prepared from it.

PULSATILLA. See **ANEMONE**, *ante*.

PULSE (Lat. *puls*), a name for the edible seeds of leguminous plants, as *corn* is the name for the edible seeds of grasses. Peas and beans are the most common and important of all kinds of pulse; next to them may be ranked kidney-beans, lentils, chick-peas, pigeon-peas, etc. *Legumine* (q. v.), a very nitrogenous principle, abounds in all kinds of pulse. Legumine forms a thick coagulum with salts of lime, wherefore all kinds of pulse remain hard if boiled in spring-water containing lime. The best kinds of pulse are very nutritious, but not easy of digestion, and very apt to produce flatulence.

PULSE (Lat. *pulsus*, a pushing or beating). The phenomenon known as the arterial pulse or arterial pulsation is due to the distention of the arteries consequent upon the intermittent injection of blood into their trunks, and the subsequent contraction which results from the elasticity of their walls. It is perceptible to the touch in all excepting

very minute arteries, and in exposed positions, is visible to the eye. "This pulsation," says Dr. Carpenter, "involves an augmentation of the capacity of that portion of the artery in which it is observed; and it would seem to the touch as if this were chiefly effected by an increase of diameter. It seems fully proved, however, that the increased capacity is chiefly given by the elongation of the artery, which is lifted from its bed at each pulsation, and when previously straight, becomes curved; the impression made upon the finger by such displacement not being distinguishable from that which would result from the dilatation of the tube in diameter. A very obvious example of this upheaval is seen in the prominent temporal artery of an old person."—*Principles of Human Physiology*, 4th ed., p. 492. The number of pulsations is usually counted at the radial artery at the wrist, the advantages of that position being that the artery is very superficial at that spot, and that it is easily compressed against the bone. In some cases it is preferable to count the number of contractions of the heart itself.

The qualities which are chiefly attended to in the pulse are its frequency, its regularity, its fullness, its tension, and its force.

The *frequency* of the pulse varies greatly with the age. In the fetus *in utero* the pulsations vary from 140 to 150 in the minute; in the newly-born infant, from 130 to 140; in the 2d year, from 100 to 115; from the 7th to the 14th year, from 80 to 90; from the 14th to the 21st year, from 75 to 85; and from the 21st to the 60th year, 70 to 75. After this period the pulse is generally supposed to fall in frequency, but the most opposite assertions have been made on this subject. There are many exceptions to the preceding statement; young persons being often met with having a pulse below 60, and cases not unfrequently occurring in which the pulse habitually reached 100, or did not exceed 40 in the minute, without apparent disease. The numbers which have been given are taken from an equal number of males and females, and the pulsations taken in the sitting position. The influence of sex is very considerable, especially in adult age, the pulse of the adult female exceeding in frequency that of the male of the same age by from 10 to 14 beats in the minute. The effect of muscular exertion in raising the pulse is well known; and it has been found by Dr. Guy that posture materially influences the number of pulsations. Thus, in healthy males of the mean age of 27 years, the average frequency of the pulse was, when standing, 81, when sitting, 71, and when lying, 61, per minute; while in healthy females of the same age the averages were—standing, 91; sitting, 84; and lying, 79. During sleep the pulse is usually considerably slower than in the waking state. In disease (acute hydrocephalus, for example), the pulse may reach 150 or even 200 beats; or, on the other hand (as in apoplexy and in certain organic affections of the heart), it may be as slow as between 30 and 20.

Irregularity of the pulse is another condition requiring notice. There are two varieties of irregular pulse: in one, the motions of the artery are unequal in number and force, a few beats being from time to time more rapid and feeble than the rest; in the other variety, a pulsation is from time to time entirely left out, constituting intermission of the pulse. These varieties often concur in the same person, but they may exist independently of each other. Irregularity of the pulse is natural to some persons; in others it is the mere result of debility; but it may be caused by the most serious disorders, as by disease of the brain, or by organic disease of the heart; and hence the practical importance of ascertaining the various meanings of this symptom.

The pulse is said to be *full* when the volume of the pulsation is greater than usual, and it is called *small* or *contracted* under the opposite condition. A full pulse may depend upon general plethora, on a prolonged and forcible contraction of the left ventricle of the heart, and possibly, to a certain extent, on relaxation of the arterial coats; while a small pulse results from general deficiency of blood, from feeble action of the heart, from congestion of the venous system, or from exposure to the action of cold. When very small it is termed *thread-like*.

The *tension* of the pulse is the property by which it resists compression, and may be regarded as synonymous with *hardness*. A hard pulse can scarcely be stopped by any degree of pressure of the finger. It occurs in many forms of inflammation, and its presence is commonly regarded as one of the best indications of the necessity of venesection. A *soft* or compressible pulse is indicative of general weakness.

The *strength* of the pulse depends chiefly on the force with which the blood is driven from the heart, but partly also upon the tonicity of the artery itself and the volume of the blood. A strong pulse is correctly regarded as a sign of a vigorous state of the system; it may, however, arise from hypertrophy of the left ventricle of the heart, and remain as a persistent symptom even when the general powers are failing. As strength of the pulse usually indicates vigor, so *weakness* of the pulse indicates debility. There may, however, be cases in which weakness of the pulse may occur in association with undiminished energy of the system at large. For example, active congestion of the lungs may so far impede the passage of the blood through these organs that it cannot reach the heart in due quantity; the necessary result is a weak and feeble pulse, which will rapidly increase in strength if the congestion is relieved by free blood-lettings. Various expressive adjectives have been attached to special conditions of the pulse, into the consideration of which our space will not permit us to enter. Thus, we read of the jerking pulse, the hobbling pulse, the corded pulse, the wiry pulse, the thrilling pulse, the rebounding pulse, etc.

PULTE, JOSEPH HIPPOLYTE, b. Germany, 1811; studied at Berlin and Marburg; took a medical degree, and settled in Pennsylvania in 1834. He removed to Cincinnati in 1840, was professor in the Cleveland homeopathic college 1852-55, and afterward of clinical medicine in the Pulte medical college at Cincinnati. He has written a number of books which are of high authority in homeopathic medicine.

PULTENEY, WILLIAM, Earl of Bath, 1682-1764; b. England; educated at Westminster school and Christchurch, Oxford. After traveling on the continent he was elected to parliament for the borough of Hedon, in Yorkshire, continuing as a whig to represent that town through the whole reign of queen Anne. On the prosecution of Walpole in 1712, he defended him with great eloquence. On the accession of George I. he was appointed secretary of war under Walpole; joined the opposition in 1725, and became the bitter antagonist of the minister, succeeding by the brilliancy of his speeches and his patriotic utterances in depriving him of his place. In 1742 he was created earl of Bath; was very popular as the leader against Walpole. On the resignation of the Pelham ministry he was made premier; but, unable to form a cabinet, he held the office for only two days, and retired from public life.

PULTOWA. See **POLTAVA**.

PULTUSK, a t. of Poland, in the government of Lomza, is situated in a thickly-wooded district on the Narew, 35 m. n.e. of Warsaw. It contains numerous churches and a very large bishop's palace. Pop. '67, 7,196. Here, on Dec. 26, 1806, was fought one of the battles of the campaign of Eylau, between the Russians and the French. The field was most obstinately contested; but the victory—which, however, was claimed by both armies—inclined in favor of the French.

PULU, a beautiful substance, resembling fine silk, of a rich brown color and satin luster, used largely as a styptic by the medical practitioners of Holland, and introduced into this country for the same purpose. It consists of the fine hairs from the stipes of one or more species of tree-fern, referable, without doubt, to the genus *cibotium*. It was first imported into this country in 1844 from Hawaii, under the name of pulu, or vegetable silk, and was proposed as a substitute for silk in the manufacture of hats, but could not be applied. In 1856 it was again imported from Singapore under the Malay names of penglawar djambi and pakoe kidang, and was said to have been used in Dutch pharmacy for a long period as a styptic. Several importations have since taken place, and it has been successfully used. It acts mechanically by its great absorbent powers.

PULWUL, a t. of British India, in the district of Gurgaon, in the Punjab, 36 m. s. by e. from Delhi, on the route to Muttra. Pop. '68, 12,629.

PUMA, or **COUGAR**, *Felis concolor*, *leopardus concolor*, or *puma concolor*, one of the largest of the American *felidae*, rivaled only by the jaguar. It is sometimes called the American lion, although it is more allied to the leopard, notwithstanding its want of spots and stripes. It is from 4 to 4½ ft. in length from the nose to the root of the tail, and the tail about 2 ft. or 2½. The fur is thick and close, reddish-brown above, lighter on the sides, and reddish-white on the belly; the muzzle, chin, throat, and insides of the legs greyish-white, the breast almost pure white. Young pumas have dark-brown spots in three rows on the back, and scattered markings elsewhere, exhibiting the relation to the leopards. The long tail of the puma is covered with thick fur, and is generally coiled up, as if it were prehensile, which it does not seem to be, although the puma climbs trees very well, and often descends on its prey from among their branches. The puma was formerly found in all except the coldest parts of America, but is now rare in most parts of North America, having been expelled by man. It rarely attacks man, but is very ready to prey on domestic animals, and seems to have a thirst for blood beyond that of other *felidae*, one puma having been known to kill 50 sheep in a night, drinking a little of the blood of each; a very sufficient reason for the anxiety which all American farmers show for its destruction. Yet it is easily tamed, and when tamed, a very gentle creature, purring like a cat, and showing equal love of attentions. The geographical range of the puma extends far southward in Patagonia, and northward even to the state of New York, although it is now very rare in all long-settled parts of North America. It is the *painter* (panther) of North American farmers. It sometimes issues from the forests, and roams over prairies and pampas, and is not unfrequently caught by the lasso of South American hunters. A **BLACK PUMA** (*felis nigra* of some naturalists), a doubtful species, and probably only a variety of the common puma, is found in some parts of South America.

PUMICE, a mineral found in volcanic countries, generally with obsidian and porphyries. In chemical composition, it agrees with obsidian, of which it may be regarded as a peculiar form, rapidly cooled from a melted and boiling state. It is of a white or gray color, more rarely yellow, brown, or black; and so vesicular, that in mass it is lighter than water, and swims in it. The vesicles, or cells, are often of a much elongated shape. Pumice often exhibits more or less of a filamentous structure, and it is said to be most filamentous when silica is most abundant in its composition. It is very hard and very brittle. It is much used for polishing wood, ivory, metals, glass, slates, marble, lithographic stones, etc., and in the preparation of vellum, parchment, and some kinds of

leather. Among other purposes to which it is applied is the rubbing away of corns and callosities. Great quantities are exported from the Lipari isles to Britain and all parts of Europe. The Lipari isles are in great part composed of pumice, which there, as in some other places, occurs as a rock. Pumice is the chief product of some volcanic eruptions; but in some eruptions, none is produced. It is found also in regions where there are now no active volcanoes, as at Andernach on the Rhine.

PUMPKIN. See GOURD.

PUMPS are machines for raising water and other fluids to a higher level. They are divided into several classes according to their mode of action. Of these, as the most important, we shall describe in detail the following: 1. The lift or suction-pump; 2. The lift and force-pump; 3. The chain-pump; 4. The centrifugal pump; 5. The jet-pump.

1. *The Lift or Suction-pump.*—The diagram (Fig. 1.) represents the ordinary suction-pump. A is a cylinder, which is called the barrel; with it is connected at the bottom a pipe, B, which communicates with the water to be raised; and at its top is another pipe, C, which receives the water raised. In the barrel are placed two valves, D and E. D is fixed in position at the bottom of the barrel; E is attached to and forms part of the piston F, which moves up and down the barrel when motive-power is applied to the rod G. The piston, or bucket, consists of a cylindrical piece of wood or metal, which fits exactly the barrel in which it moves, so that no water or air can pass between its circumference and the sides of the cylinder. This tight fitting is attained in wooden pistons by surrounding them with a leather ring; and in those of metal, by hemp or other packing, which is wrapped round a groove made in their outer surface. The hollow interior of the piston is closed at the top by the valve E, which is a kind of door opening on a hinge, at one side of it, in an upward direction, on the application of pressure, and shutting on to its seat on the piston when the pressure is removed. When opened, water or air can pass through it to the upper side of the piston; but when shut, none can pass from one side of the piston to the other. The other valve, D, is similar to it in all respects, except that, as before stated, it is fixed in the bottom of the barrel; it also can only open upward.

To describe the action of the pump, we shall suppose the piston to be at the bottom of the barrel, and the pump to contain nothing but air. On moving the piston up the barrel—the valve in it being shut, and kept so by the atmospheric pressure above it—no air can pass from above it into the part of the barrel from which it is moving; the air contained in which becoming rarefied, by having to occupy a greater space, exerts less pressure on the valve D at the bottom of the barrel than the air in suction-pipe B below it. This valve is thus opened, and the air from the suction-pipe enters the barrel; so that when the piston has arrived at the top, a volume of air equal to the contents of the barrel has passed from the suction-pipe into the barrel. When the piston descends, it compresses the air in the barrel, which shuts the valve D; and when the density of the compressed air becomes greater than that of the atmosphere, the valve E in the piston is forced open, and the air in the barrel passes to the upper side of the piston. The next upward stroke of the piston again draws a like quantity of air from the suction-pipe into the barrel; and, as none of this air again enters the pipe, but is passed to the upper side of the piston by its downward stroke, the suction-pipe is by degrees emptied of the air it contained. During this process, however, motion has taken place in the water at the foot of the suction-pipe. The surface of the water at H is pressed upon by the weight of the atmosphere with a pressure of about 15 lbs. on every square inch; and, by the laws of fluid pressure, if an equal pressure is not exerted on the surface of the water in the suction-pipe, the water will rise in it, until the pressure on the surface, plus the weight of its fluid column, balances the pressure of the atmosphere on the surface H outside; so that, as the air in the suction-pipe is rarefied, the water rises in it, until, when all the air is extracted from it, the water stands at the level of the valve D. By the next upward stroke of the piston, the barrel being emptied of air, the water follows the piston, and fills the barrel as it filled the suction-pipe. The pressure produced by the downward stroke shuts the valve D, and forces the water in the barrel through the valve E. The succeeding upward stroke carries this water into the pipe above, and again fills the barrel from the suction-pipe. In like manner, every successive upward stroke discharges a body of water equal to the content of the barrel into the pipe above it, and the pump will draw water as long as the action of the piston is continued.

Fig. 1.

The action of this pump may be more shortly described by saying that the piston withdraws the air from the barrel, and produces a vacuum, into which the water rushes through the suction-pipe, impelled by the pressure of the atmosphere on its surface. This atmospheric pressure balances a column of water of about 33 ft. in height; so that if the barrel be placed at a greater height than this from the surface of the water in the well, the water will not rise into it, and the pump will not draw.

With regard to its efficiency—that is to say, the relation between the power expended and the work produced, as measured by the water raised—we may remark, that the power is expended—1st, in raising the water through the required height; 2d, in overcoming the friction of the moving parts of the pump; 3d, in the friction and fluid resistance of the water in passing through the valves and pipes; 4th, in the losses arising from the want of proper proportion between the various parts of the pump. The losses arising from these last sources are very great, and vary so much according to the construction of each particular pump, that no useful estimate can be formed of the efficiency. We may say, however, that a pump of this description, to yield 50 per cent of the applied power, must be well proportioned and carefully constructed.

2. *The Lift and Force-pump.*—The ordinary forms are very similar to the suction-pump before described, with this exception, that the valve represented by E in Fig. 1, instead of being fixed on the piston, is placed in the discharge-pipe, the piston itself being solid. The water is drawn up into the barrel by suction in the manner just described in the suction-pipe, and then the pressure of the piston in its downward stroke forces it through the outlet valve to any height that may be required. Another form is provided with a different description of piston, called the plunger-pole. Its action is precisely the same as that of the other, with this exception, that the plunger-pole, instead of emptying the barrel at every stroke, merely drives out that quantity which it displaces by its volume. It is simply a solid rod of metal moving through a water-tight stuffing-box. This stuffing-box is made by placing, on a circular flange of metal, rings of india-rubber or other packing, the inner diameter of which is slightly less than that of the plunger-pole. On these is placed a ring of metal, and through the whole are passed bolts, which, on being screwed tight, force the packing tightly against the plunger-pole. It possesses many advantages, for the packing can be tightened and repaired without removal of the piston or stoppage of the pump; also, the cylinder is not worn by its action, nor does it require to be accurately bored out, as in the other form of pump.

In these pumps, it will be observed that the water is forced into the ascending pipe or column only on the downward stroke; it will thus be discharged in a series of rushes or jerks. As it is a great object to procure a continuous discharge, both for its convenience, and for the saving of the power wasted by the continual acceleration and retardation of the ascending column, various methods have been used for that purpose. The most common is the reservoir of air, which is an air-tight receptacle fixed vertically on the discharge-pipe; the water forced into the pipe by the down-stroke compresses this air, which, acting as a spring, returns this force to the ascending column during the period of the up-stroke, and so, by taking the blow of the entering water, and returning it gradually, equalizes the pressure, and renders the discharge uniform. Another method is the double-action force-pump, by which equal volumes of water are forced into the ascending column by both up and down strokes. A solid piston is worked by a rod of half the section of the piston itself. During the up-stroke, the upper surface forces a volume of water into the ascending column, and the lower surface draws in twice that volume. In the down-stroke, these two volumes are sent through a pipe into a receptacle, communicating with the upper face of the piston. One of the volumes fills the space between the piston rod and the cylinder which would otherwise be left empty by the descent of the piston; the other volume is sent into the ascending column; so that a volume of water equal to half the content of the barrel is sent into the ascending column by both the up and the down strokes.

A pump exhibited in the international exhibition of 1862, by Messrs. Farcot & Sons, attains this object in a much more simple manner. In it "two equal pistons, with valves affording very large water-ways, work parallel to each other in two pump cylinders. During the successive strokes, the first piston draws in water by its upper surface, and delivers it to the ascending column by causing it to traverse the second piston. In its ascending course, the second piston raises in its turn the column of water by its upper face, while the lower face sucks the water, causing it to traverse the first piston." It will be seen from this description that a valve is placed in each piston, that the cylinders communicate at their base, and that the pistons make their strokes simultaneously. This pump has yielded all the good results promised by its ingenious construction, and it is adopted in the water-supply of Paris.

In spite of the great antiquity of the lift and force pump, it is only of late years that improvements have been introduced into its construction capable of rendering it an efficient machine—that is, one which returns in the shape of water raised, a good proportion of the power applied to it. In 1849 M. Morin found by experiments that the power lost was 55 to 82 per cent—that is to say, that of the motive-power, 45 per cent was yielded in the best and 18 in the worst, giving an average of about 30 per cent. In 1851 the jury, reporting on those exhibited in the great exhibition, say that it is one of our worst machines, considered in a mechanical sense, as a means

of producing a given result with the least possible expense of power. In those exhibited in the international exhibition of 1862, we find a marked improvement. The jury report that "a large number of constructors have sought to give the waterways and valves dimensions which render as small as possible the loss of power by friction. They have also sought to give a continuous movement to the ascending column of water, independently of the action of the reservoir of air."

3. *The Chain-pump.*—This pump is formed in general of plates of wood fastened to an endless iron chain, and moving upward in a rectangular case or box. There was exhibited in the international exhibition of 1862 a pump of this description called "Murray's chain-pump;" a pump which is very much used on public works, on account of the ease of its construction and erection, and its admirable efficiency even at considerable heights. In this pump, the friction is reduced by having only 3 or 4 lifts instead of 20 or 30, as was previously the case. The chains pass under a roller at the foot, and are driven by a small pitch-wheel at the top, over which they are conducted, and which is driven by appropriate gearing. The lifts feather in passing over the wheel to the descending side, and only unfold when brought round to the ascending side; thus the pump is enabled to take off the water with the same dip as other pumps. The pump is not liable to be choked, as a back turn of the chain immediately releases any substance getting between the lift and the barrel. The speed is variable, in proportion to the duty required. The speed at which the chain is ordinarily worked is from 200 to 300 ft. per minute. The greatest lift yet made by Murray's chain-pump is 60 ft. high; but it is considered that 100 tons of water per minute could be raised 100 ft. high. From 10 to 12 ft. apart has been found to be the best pitch for the lifts; putting them nearer, needlessly increases the friction. Experiments made by Mr. Lovick for the metropolitan board of works, showed that the slip of the lifts which work in the barrel, and are one-eighth of an inch shorter each way than the barrel, averaged 20 per cent of their motion, and that the useful work done averaged 63 per cent of the indicator horse-power of the engine working it.

4. *The Centrifugal Pump.*—These pumps, with reference to those previously described, may be called new, as, though they have been in use in one form or another for at least a century, their merits were not brought prominently forward till the year 1851, when the great efficiency of the models exhibited by Messrs. Appold, Gwynne, and Bessemer drew general attention to the subject.

The essential parts of this pump are—1. The wheel to which the water is admitted at the axis, and from which it is expelled at the circumference, by the centrifugal force due to the rotatory motion imparted to it in passing through the rapidly revolving wheel; and 2. The casing or box in which the wheel works, and by which the entering water is separated from that discharged.

Fig. 2 is a section of a centrifugal pump. The water enters the pump by the supply-pipes A, A, which lead to the central orifices of the wheel B; it then passes through passages formed by the vanes and the side covering-plates of the wheel. In passing through these passages of the wheel, which is made to revolve by power applied to the shaft E, it acquires a rotatory motion, which still continues when it leaves the circumference of the wheel, and enters the circular whirlpool chamber F; so that the interior of the pump may be looked on as a whirlpool, extending from the axle of the wheel to the circumference of the whirlpool chamber. Into this whirlpool the water is drawn at the central orifice of the wheel, and discharged by a pipe at the circumference of the whirlpool chamber; and the force with which it is discharged, or the height to which it will rise in the outlet pipe is measured by the centrifugal force of the water revolving in the whirlpool.

With reference to the efficiency of these pumps, it is impossible to give any accurate estimate, since as high as 70 per cent of the applied power is claimed to be returned by forms of the pump shown in figs. 7 and 8, while some other descriptions experimented on in 1851 gave only 18 per cent of useful effect.

It will be evident, from the above description of the pump, that the height to which the water will be raised depends entirely upon the speed of revolution of the wheel; and it is by this that the application of centrifugal pumps is limited to comparatively low lifts of say less than 20 ft., as the speed for high lifts requires to be greater than can be conveniently and usefully attained in practice. They are best applied when raising large quantities of water through low lifts. It will also be observed, that on account of the simplicity of their parts, and the absence of valves, they are much less liable than other pumps to be choked by the entrance of solid materials. In some descriptions of this pump, the exterior whirlpool chamber is dispensed with; and to the vanes of the wheel

FIG. 2.

is given such a curvature backward from the direction of motion, that the water leaving the circumference of the wheel is spouted backward from the vane-passages with a speed equal to that of the wheel in the opposite direction, so that it has only a radial motion with reference to a fixed object; in other words, that the force is acquired from the radial component of the pressure of the vanes, instead of the centrifugal force of the revolving water. Those pumps, however, give the best results which, as the one above described, combine both actions. In all cases, curved vanes are much superior to straight ones.

5. *The Jet-pump.*—This pump is worked by water-power, and is worthy of notice on account of the extreme simplicity of its parts, and of not requiring the care of an attendant while in operation.

Fig. 3.

Fig. 3 is a representation of this pump, C is the water which it is required to raise to the level of the water D, and B is the water in the stream available for working the pump. The water B passes down the pipe A, and is discharged from the jet or nozzle, E, into the conical pipe F. Round the nozzle is the vacuum-chamber G, at the bottom of which is attached the conical pipe F, and into the side of which the suction-pipe H enters from the water to be pumped. The water, in passing from the nozzle into the conical pipe, carries air with it, and so gradually forms a vacuum in the chamber G, when the water rises into it from the level C, through the pipe H; and it is in turn carried with the jet down the conical pipe into the discharge-level D. The velocity of the water coming from the jet is gradually retarded by the action of the conical pipe, the speed decreasing as the area of suction increases; and the *vis viva* of its motion is by this retardation converted into a sucking force, drawing the water from the suction-pipe through the vacuum chamber into the conical pipe. The water issuing from the jet will have a speed equal to that produced by a column of the height BC, or the sum of the fall and lift. This pump may be viewed, for purposes of explanation, as a syphon, into the shorter leg of which a jet of water is injected, which overcomes the pressure due to the difference of levels, and reverses the ordinary motion of the water in a syphon. An efficiency of 18 per cent has been obtained from this pump, which is low, as compared with that obtained from other descriptions of pump; yet in cases where waste of water power is not so much to be avoided as expense in erecting, working, and maintenance, these pumps possess decided advantages. The case to which they are peculiarly applicable is the drainage of marshes, which have streams of water adjacent to them descending from a higher level.

PUMPELLY, RAPHAEL; b. Owego, N. Y., 1837; educated in scientific branches, and especially metallurgy, chemistry, and geology, at Paris, Hanover, and Freiberg-in-Saxony. On his return in 1860 he had charge of some mines in Arizona and other parts of the far west, and in 1861 was employed by the government of Japan to explore the island of Yezo. In 1866 he became professor of mining engineering at Harvard college. In 1870 he made a survey of the copper regions of Michigan, and the next year became state geologist of Missouri. Besides many scientific articles and geological reports he has published *Across America and Asia*, an account of his overland journey from Japan through Mongolia, Siberia, and Russia.

PUMPING ENGINE, an engine especially designed for pumping. A pump may be driven by an ordinary steam-engine which also drives other machinery, but in the pumping-engine the pump and steam-engine are inseparably connected, and are confined to the act of pumping. There are a good many small machines of this kind which only pump, but they are not commonly called pumping-engines, that term being applied only to large works. The first steam-engines were pumping-engines; that of Newcomer, which was driven by atmospheric pressure (steam being used only to create a vacuum), and Watt's, and the Cornish engine, which used steam as the motive-power. See **STEAM-ENGINE.** There has been much improvement in the duty of pumping engines since the Newcomer engine. Estimating the work done by the number of pounds raised one foot by a bushel of Welsh coal (94 lbs.), the following shows the improvement which has been made: Newcomer engine 1769, 5,500,000; do. improved by Smeaton 1772, 9,500,000. Watt's engine 1778 to 1815, 20,000,000. Improved Cornish engine 1820, 28,000,000; do. 1826, 30,000,000; do. 1828, 37,000,000; do. 1829, 41,000,000; do. 1839, 54,000,000; do. 1850, 60,000,000. Consolidated mines, highest duty 1827, 67,000,000. Fowey consols, Cornwall, highest duty 1834, 97,000,000. United mines, highest duty, 1842, 108,000,000. Among the largest pumping-engines in the world are the three which were employed in the drainage of Haarlem lake in Holland. Each engine worked several pumps, and had an average duty of 75,000,000 lbs., raised one foot by 94 lbs. of Welsh coal. One of the engines is described as follows: Two steam cylinders are placed

concentrically, the diameters being $144\frac{1}{2}$ and $84\frac{1}{2}$ inches. They are united at the bottom, but there is a space of $1\frac{1}{2}$ in. between the inner cylinder and the top. The areas of the pistons are as 1 to 2.85, and are connected to a common cross-head or cap by one principal and four small piston-rods. This engine works 11 pumps, each of 63 in. ($5\frac{1}{4}$ ft.) diameter. The measured delivery of all the 11 pumps at each stroke is 63 tons. The steam is cut off in the small cylinder at from one-quarter to two-thirds the stroke, and after expanding through the remainder it is further expanded in the large cylinder. A good example of a pumping-engine is the Holly pumping-engine, for a description of which see WATER SUPPLY. See also STEAM-PUMP.

PUN is the name given to a play upon words. The wit lies in the equivocal sense of some particular expression, by means of which an incongruous and therefore ludicrous idea is unexpectedly shot into the sentence. One or two examples will make the matter clearer than any definition. Two persons looking at a beggar-boy with an extraordinary big head—"What a tower!" cried the first. "Say, rather," replied the second, "what a *fort o' lice*?" (fortalice).—A noted punster was once asked, with reference to Mr. Carlyle's writings, if he did not like "to expatiate in such a field." "No," was the felicitous rejoinder; "I can't get over the *style*" (stile).—A Massachusetts lady complaining to a friend that her husband (whose business had taken him to the far west) constantly sent her letters filled with expressions of endearment, but no money, was told, by way of comfort, that he was giving her a proof of his *unremitting* affection!

PUNCH, the chief character in a popular comic exhibition performed by means of *puppets* (q.v.). Various accounts are given of the origin of the name. The exhibition is of Italian origin, and the Italian name is *Pulcinella*, or *Policinella*. According to one story, a peasant, a well-known character in the market-place of Naples, got the name *Pulcinella* from dealing in fowls (*pulcinelli*), and after his death was personated in the puppet-shows of the San Carlino theater. Another account makes the word a corruption of Puccio d'Aniello, the name of a witty buffoon of Acerra who joined a company of players, and became the favorite of the Neapolitan populace. Others give his original name as Paolo Cinella. The variety and inconsistency of the legends show them to be myths—histories invented to account for the name. The modern Punch is only a modification of an ancient mask (q.v.) to be seen represented on ancient vases, and taken perhaps from the Ocean Atellanæ; and the Italian name is pretty evidently a diminutive of *pollice*, the thumb—Tom Thumb (the dwarfs of northern mythology are sometimes styled *däumling*, thumkins). The English name *Punch* is apparently identical with Eng. *paunch*; Bavarian *punzen*, a cask; Ital. *punzione*, a puncheon; and denotes anything thick and short (e.g., a Suffolk *punch*). The name *Punchinello* seems to have arisen from blending the English and Italian names.

The drama or play in which the modern Punch figures is ascribed to an Italian comedian, Silvio Fiorillo, about 1600. The exhibition soon found its way into other countries, and was very popular in England in the 17th century. Its popularity seems to have reached its height in the time of queen Anne, and Addison has given in the *Spectator* a regular criticism of one of the performances. The scenes as now given by the itinerant exhibitors of the piece are much shortened from what were originally performed, in which allusions to public events of the time were occasionally interpolated. The following is an outline of the plot as performed in 1813. Mr. Punch, a gentleman of great personal attraction, is married to Mrs. Judy, by whom he has a lovely daughter, but to whom no name is given in this piece, the infant being too young to be christened. In a fit of horrid and demoniac jealousy, Punch, like a second Zeluco, strangles his beautiful offspring. Just as he has completed his dreadful purpose Mrs. Judy enters, witnesses the brutal havoc, and *exit* screaming; she soon returns, however, armed with a bludgeon, and applies it to her husband's head, "which to the wood returns a wooden sound." Punch at length exasperated seizes another bludgeon, soon vanishes his already weakened foe, and lays her prostrate at his feet; then seizing the murdered infant and the expiring mother, he flings them both out of the window into the street. The dead bodies having been found, police-officers enter the dwelling of Punch, who flies for his life, mounts his steed; and the author neglecting, like other great poets, the confining unities of time and place, conveys his hero into Spain, where, however, he is arrested by an officer of the terrible inquisition. After enduring the most cruel tortures with incredible fortitude, Punch, by means of a golden key, opens his prison door and escapes. The conclusion of the story is satirical, allegorical, and poetical. The hero is first overtaken by weariness and laziness in the shape of a black dog, which he fights and conquers; disease in the disguise of a physician next arrests him; but Punch "sees through the thin pretense," and dismisses the doctor with a few derogatory kicks. Death at length visits the fugitive: but Punch lays about his skeleton carcass so lustily, and makes the bones of his antagonist rattle so musically with a bastinado, that "death his death's blow then received." Last of all comes the devil; first under the appearance of a lovely female, but afterwards in his own natural shape, to drag the offender to the infernal regions, to expiate his dreadful crimes. Even this attempt fails, and Punch is left triumphant over doctors, death, and the devil. The curtain falls amid the shouts of the conqueror, who, on his victorious staff, lifts on high his vanquished foe.

The well-marked peculiarities in the original personification of Punch, which were a

high back, distorted breast, and long nose, were intended to give an increased zest to his witticisms; but these features have been much exaggerated in the now so well-known illustrations of the popular periodical which bears his name.

The performance of Punch, as generally represented, requires the assistance of only two persons—one to carry the theater and work the figures, the other to bear the box of puppets, blow the trumpet, and sometimes keep up the dialogue with the hero of the piece. The movements of the puppets are managed simply by putting the hands under the dress, making the second finger and thumb serve for the arms, while the forefinger works the head.

PUNCH, or the LONDON CHARIVARI, the English comic journal par excellence, is a weekly magazine of wit, humor, and satire in prose and verse, copiously illustrated by sketches, caricatures, and emblematical devices. It draws its materials as freely from the most exalted spheres of foreign politics as from the provincial nursery; and, dealing with every side of life, is not less observant of the follies of Belgravia than of the peculiarities of Whitechapel. Punch gives due place to Irish bulls and dry Scotch humor, and does its best to present them in the raciest vernacular. Stern in the exposure of sham and vice, Punch is yet kindly when it makes merry over innocent foibles. Usually a *censor morum* in the guise of Joe Miller, a genial English Democritus, who laughs and provokes to laughter, Punch at times weeps with those that weep, and *joies remotis*, pays a poetical tribute to the memory of the departed great. This wittiest of serial prints was founded in 1841, and, under the joint editorship of Mark Lemon and Shirley Brooks soon became a household word, while, ere long, its satirical cuts and witty rhymes were admittedly a power in the land. Punch is recognized as an English institution, and in corners of Europe where an Englishman rarely comes, the frequenters of the café may be seen puzzling over the esoteric wit and wisdom of Cockaigne. Their contributions to Punch helped to make Douglas Jerrold (q.v.), Tom Hood (q.v.), Albert Smith, and Thackeray (q.v.) famous; as their illustrations have done for Doyle, Leech, Tenniel, Du Maurier, and Keene. It should be noted that our comic paper has done memorable service in purifying the moral standard of current wit in England. For the alternative name see CHARIVARI.

PUNCH, a beverage introduced into England from India, and so-called from being usually made of five (Hindu, *pantsh*) ingredients—arrack, tea, sugar, water, and lemon-juice. As now prepared punch may be described as a drink, the basis of which is alcohol, of one or more kinds, diluted with water, flavored with lemon or lime juice and spices, and sweetened with sugar; sometimes other ingredients are added according to taste, especially wine, ale, and tea. The mixture is usually compounded in a large china bowl made for the purpose, and is served out in glasses by means of a ladle. It is much more rarely seen now than formerly, which is not to be regretted, for a more unwholesome or intoxicating beverage could hardly be compounded. The ordinary mixed punch consists of the following ingredients: the juice of three lemons squeezed out into a large jug, and one lemon cut into slices, with the rind on for flavor; twelve ounces of loaf-sugar, and two quarts of boiling water; after being infused half an hour, and strained off, the liquid is poured into the punch-bowl, and half a pint of rum and of brandy are added. A favorite mode of drinking this composition at present is as a liqueur after fish at dinner, for which purpose it is bottled, and when wanted, is iced, either by placing the bottles in rough ice, or by pounding and mixing in fine ice. The principal varieties of punch, in addition to this, are rum, gin, and brandy punches, in which only one of the spirits mentioned is used, and champagne, milk, orange, raspberry, tea, wine punches.

PUNCH, a tool for cutting circular or other shaped pieces out of metal, wood, or other materials. The simplest form of this instrument consists of a piece of steel formed at one end into a hollow cylinder, the end of which is ground to a very sharp cutting edge. The other end of the punch is made strong and thick, to receive blows from a hammer, and to serve as a handle. When the instrument is in use, the cutting edge is applied to the surface which is to be perforated, and a blow sufficiently hard is struck on the end of the handle, when a circular piece of the material is cut out and left in the hollow part, which can be removed at the upper end of the cylinder. The mode of manufacturing such tools is very simple. A piece of square steel-bar is taken, the thickness of which must correspond with the thickness of the handle. This is brought up to a sufficient heat in the furnace, and is then beaten or rolled laterally so as to have about the shape of a chisel. In the next stage, the edges are brought up; and finally, a mandril is put into the groove thus made, and the edges are brought together; and welded; the mandril is then withdrawn, and the tool goes to be ground and finished. It will be obvious that, by skill, punches may be made which will make holes of almost any shape. The enormous development of our iron manufactures has necessitated the use of machine-tools in the place of those made for the hand, and none of the very ingenious inventions for this purpose have played a much more important part than the *punching-machines*, for without them the labor of drilling holes in iron plates for such objects as steam-boilers, iron-ships, bridges, and other great works, would have been so great as to have effectually prevented them from being undertaken. The punching-machine invented by Messrs. Roberts and Nasmyth, with recent modifications and improvements,

is in very general use in all our great engineering works; its essential parts are the punch, lever, and the spring. The punch is simply a piece of tough, hard steel of a cylindrical form, and of the size of the intended holes; it fits into a socket, which is suspended over a fixed iron plate or bench, which has a hole exactly under the punch, and exactly fitting it. In the socket which holds the punch is a coiled iron spring, which holds up the punch, and allows it to descend when the power is applied, and returns it when the pressure is relieved. The lever, when in action, presses on the top of the punch, and the plate of metal which is to be perforated being placed on the iron bench, receives the pressure of the punch with sufficient force to press out a disk of metal exactly the diameter of the punch, which falls through the hole in the iron bench. The lever is moved by a cam on a powerful wheel, which presses upon it until it can pass; then the lever being relieved, the punch is drawn up by the spring in its socket, ready to receive the action of the cam when the revolution of the wheel again brings it to bear on the lever. The punch itself is always solid, differing entirely in this respect from the hand-tools. This useful machine will perforate thick plates of iron, such as are used for ship-building, almost as quickly as a workman with an ordinary hand-punch could perforate thin plates of tin; the holes made are quite true, and are ready to receive the rivets.

PUNCTUATION, the division of a writing into sentences, and the subdivision of these into parts by means of certain marks called *points*, a great help to the clear exhibition of the meaning and to the pleasant reading of what is written. The ancients were not acquainted with the use of points, or used them very little, and only for oratorical purposes. Punctuation, according to the grammar and sense, is said to have been an invention of the Alexandrian grammarian, Aristophanes; but was so much neglected and forgotten, that Charlemagne found it necessary to ask Warnefried and Alcuin to restore it. It consisted at first of a point called the *stigma*, and sometimes a line, variously formed and introduced. The system of punctuation now in use was introduced by the Venetian printer, Manutius, in the latter part of the 15th c.; the example was soon and generally followed, and little change has since been found requisite.

PUNCTUATION (*ante*), the division of any written or printed composition into words, phrases, and sentences by certain marks, commonly called punctuation points. This process enables the writer to express his ideas more clearly, and the reader to understand more readily and more fully. Material errors in the arrangement of an author's ideas, and in the order of the phrases in the sentences, have been detected and corrected by the judicious application of a critical punctuation. For a long period after the introduction of the alphabet into general use, all the words, sentences, and letters of every composition were written continuously, and usually in large capitals at equal distances, after this manner: "GOTOTHEANTHOU SLUGGARD CONSIDER IERWAYS ANDBEWISE." When the writing was in small letters, it would be given in this fashion: "the Lord is my shepherd I shall not want." By whom the earliest attempts at punctuation were made is not known. The art has been very slowly developed. Some of the most trustworthy writers on archæology ascribe the earliest attempts to Aristophanes; others to Thrasymachus, and to various other Grecian scholars several centuries before Christ. But whatever efforts were thus made, they were imperfect and transient. In the 8th c. Charlemagne directed several of the most learned men of that age to revive and remodel these obsolete attempts at punctuation; but with results scarcely more effective or enduring than those whose lost memories they aimed to revive.

Near the close of the 15th c. Aldus Manutius, otherwise known as Manuzio, Manuzzi, or Manucci, also called Aldus the elder, was an eminent printer and publisher in Venice. In making some of his numerous improvements in the art of printing he became impressed with the necessity of facilitating the more ready understanding of printed matter. He invented and practically applied the main features of that system of punctuation which, with few important changes from time to time, has continued to the present day.

In modern times punctuation is considered one of the most difficult parts of grammar fully to explain or rightly to understand. Grammarians differ widely in their general rules, and authors differ quite as widely in their application of these rules to particular cases. As to the most important principles, however, there is a very general agreement. Among the various marks and characters employed in this scheme of punctuation, the period, the colon, the semi-colon, and the comma are the most important and the most frequent. Other marks in use are interrogation and exclamation points, quotation marks, the hyphen, the apostrophe, etc.

The comma, from the Greek *κωμειν*, to cut off, indicates a shorter pause in reading, and demanding usually less notice than any other punctuation point. Under some circumstances, however, it has great importance. Its design and value are readily seen, yet the occasions for its use, from their great number and variety, are most difficult to specify and define. When more than two nouns, adjectives, verbs, or adverbs succeed each other in a series, in either of the elements of a simple sentence, they should each be separated by commas, including, by latest usage, even the last couplet, in which the connecting conjunction is expressed. Many qualifying and explanatory phrases, and adverbs when so used, require a comma before and after them. The name of a person addressed or of anything thus personified, all words and phrases used independently,

the members of compound sentences, antithetical and parenthetical words and phrases, each word of a series in the same construction, and words repeated for the sake of emphasis, should be separated before and after by commas. But when words or ideas are arranged in pairs, the comma is placed only after each couplet. The semi-colon is used to separate those members of a compound sentence which demand a longer pause than a comma, or which contain in themselves the principal elements of a sentence, but do not, either of them, individually, fully express the main ideas of the sentence. This point is also used when the members of a compound sentence are antithetical. The colon marks a still longer pause than the semi-colon. It is placed after the address in the commencement of a letter or other communication; as, "My Dear Sir:" "To the Editor of the Galaxy." This point is also legitimately placed near the close of any long sentence that is not yet completed, especially if two or more semi-colons have immediately preceded in the same sentence. The period is placed at the end of every paragraph, and of every completed sentence, except when the sentence ends with a question or an exclamation. It is placed also after the titles or other headings of the chapters, and all other important divisions of a volume or other treatise.

To understand fully and to apply in the best manner the principles of punctuation is more difficult from the fact that the best writers and most critical grammarians differ so widely from each other, and even from themselves at different times and in different circumstances. It is, then, impossible to give strict and universal rules for the application of the principal punctuation points. Punctuation demands for its full elucidation, and its successful application, a quick apprehension, good judgment, a cultivated taste, and an extensive and varied reading.

PUNDERPUR, or **PANDHARPUR**, a t. of British India, in the district of Sholapur, and presidency of Bombay, 90 m. e. from Satara, on the right bank of the Bima, a large branch of the Kistna. It is highly revered by the Hindus, on account of a celebrated temple dedicated to an incarnation of Vishnu. Pop. '72, 16,275.

PUNDLER, the name which in Scotland used to be given to a person employed on an estate as hedger, ditcher, forester, and general guardian, in absence of the proprietor. The office of a pundler was probably analogous to that of poynder. In a few cases, the term pundler is still employed.

PUNIC WARS, the name commonly given to the three great wars waged for supremacy between Rome and Carthage. The Latin word *punicus*, or *penicus*, was the name given by the Romans to the Carthaginians, in allusion to their Phenician descent. For an outline of the struggle between the two rival powers, see **CARTHAGE**, **ROME**, **HAMILCAR**, **HANNIBAL**, and the **SCIPIOS**. The Romans, who believed, not without reason, that the Carthaginians never sincerely meant to keep any treaty of peace, employed the phrase *punica fides*, "Punic faith," to denote a false and faithless spirit.

PUNICA. See **POMEGRANATE**.

PUNISHMENT, in this country, usually means the deprivation of property or liberty, or the infliction of pain on the body of one who commits a criminal offense. It is not applicable, generally, to civil actions, though these are also followed with the compulsory payment of money, and failing which, with the deprivation of property and liberty. As the legal consequence of crimes, punishment consists chiefly of the infliction of pain on the body, and this ranges from capital punishment or death, down to imprisonment for a term of years, and, in some cases, whipping is added; and in military and naval offenses, flogging. Capital punishment is inflicted only in case of treason and murder (but there are other instances under naval or army discipline), and in the form of hanging (q.v.). In crimes of less degree, imprisonment, or penal servitude (q.v.) for a term of years, is the punishment. As a general rule, the judge has a discretion to fix the punishment within two defined limits. In the great mass of the smallest crimes, which are cognizable by justices of the peace, and are frequently termed offenses punishable summarily, the usual punishment is a fine or penalty, i.e., a sum of money is ordered to be paid by the offender, and if he do not pay it, his goods are sold to make up the sum: failing which, he is committed to the house of correction for a short period of 3, 6, or 12 months; but, in some of the cases, imprisonment and hard labor are imposed in lieu of a fine. The crown can put an end to a sentence of punishment by a free pardon, or may commute a sentence of death to imprisonment for life.

PUNISHMENT (*ante*). Three theories concerning the design of punishment are held—those of retribution, prevention, and reformation. According to the first the only purpose of punishment is the vindication of the law upon the transgressor, or the infliction upon him of such pain or deprivation as he deserves: its motto might be said to be, justice. The second makes prevention the only object, the offender being kept from further wrong-doing, and others being deterred from criminal acts by the certainty of punishment: its motto, protection. The third theory regards the reformation of the criminal as the only legitimate design of punishment, and maintains that when this is accomplished, further punishment should cease: its motto, love; probably no one of these three theories exhausts the whole content of punishment; yet each may have a certain application—the question then becoming one as to which of the three shall be prominent.

PUNISHMENT, FUTURE. See HELL.

PUNISHMENTS, MILITARY AND NAVAL. These, in the British service, include death, by shooting, if for an offense against discipline—or by hanging, if for a disgraceful offense; for serious crimes in the field against discipline, flogging, not exceeding 50 lashes, with the cat-o-nine-tails (see FLOGGING); for minor offenses, degradation of rank, imprisonment, extra drill, stoppage of grog, loss of good-conduct pay, stoppage of leave, etc. Death, degradation, and loss of leave are the only punishments of those named above which can be inflicted on an officer. An officer can only be punished by sentence of a court-martial; he may be cashiered, dismissed the service, deprived of his regiment or ship; or, in the navy, reduced in rank by being placed at the bottom of the list of officers of his grade. In certain of the German armies, punishment is inflicted on the men in the form of strokes with a cane or with the flat of a saber.

PUNJAB, or PANJAB (from two Persian words signifying “five rivers:” the *Pentapotamia* of the Greeks), is an extensive territory in the n.w. of Hindustan, watered by the Indus, and its five great affluents—the Jhelum, Chenab, Ravi, Beas, and Sutlej, and forms a British possession since Feb., 1849. It is bounded on the w. by the Suliman mountains, on the n. by Cashmere, and on the e. and s.e. by the Sutlej, which, in its lower course, is called the Ghara. The extreme length is about 800 m., and the width about 650 miles. The total area is over 200,000 sq.m., more than half of which is the territory of feudatories. The British possessions are 101,829 sq.m., of which less than a third is cultivated. According to the census of 1868 as finally revised and corrected, the pop. is 17,611,498; giving an average of 173 to the sq.mile. The length of roads is 20,798 m.; railways open, 412 miles. The physical character of the northern contrasts strikingly with that of the southern districts. In the n., the whole surface is traversed by spurs from the Himalayas, which inclose deep valleys. In the s., the surface is unbroken by any important eminence, except the Salt range, varying from 2,000 to 5,000 ft. high, between the Indus and the Jhelum. The country, divided into five doabs, or interfluvial tracts, and frequently spoken of as the plains of the Indus, has a general slope toward the s.w. The climate in the plains is most oppressively hot and dry in summer, reaching in May 115° to 121° in the shade at several stations; but cool, and sometimes frosty, in winter. Little rain falls except in the districts along the base of the Himalayas. The soil varies from stiff clay and loam to sand; but, in general, is sandy and barren, intermixed with fertile spots. The rivers afford abundant means of irrigation. The indigenous vegetation of the Punjab is meager. Trees are few in number and small, and fuel is so scarce that cow-dung is much used in its stead. With an efficient system of agriculture, however, the territories of this part of India might be rendered very productive. Of the ordinary crops, wheat of excellent quality is produced in considerable quantities, and indigo, sugar, cotton, tobacco, opium, buckwheat, rice, barley, millet, maize, and numerous vegetables and fruits are grown. The manufacturing industry of this region is very considerable, and is carried on for the most part in the great towns, as Amritsir (q.v.), Lahore (q.v.), Multan (q.v.), etc. Spices and other groceries, dye-stuffs, cloths, metals, and hardware are imported from the more eastern provinces of British India; and grain, ghee, hides, wool, carpets, shawls, silk, cotton, indigo, tobacco, salt, and horses are exported. The inhabitants are of various races, chiefly Sikhs, Jats, Gujars, Rajputs, and Patans. Of the whole population, nearly two-thirds are Mohammedans; the remaining third is pretty fairly divided between those of the Hindu faith and the Sikhs. There are upward of 17,000 Europeans in the Punjab. The Jats are the most prominent of the races of the Punjab, and are said to have formed the “core and nucleus” of the Sikh nation and military force. Of the history of the Punjab, all that is important is given under the heading **SIKHS**.

PUNKAH, a gigantic fan for ventilating apartments, used in India and tropical climates. It consists of a light frame of wood, covered with calico, from which a short curtain depends, and is suspended by ropes from the ceiling; another rope from it passes over a pulley in the wall to a servant stationed without; the servant pulls the punkah backward and forward, maintaining a constant current of air in the chamber.

PUNSHON, WILLIAM MORLEY, D.D., 1824–81; b. England; became local preacher in the Methodist connection in 1840 at Sunderland; studied as a probationer at the Wesleyan college, Richmond; became pastor at Marden in Kent; and at Whitehaven in 1845. After this he was stationed at Carlisle, Newcastle-on-Tyne, Sheffield, and Leeds, removing in 1858 to London, where he remained for nine years. In 1868 he went to Canada as a delegate to the Canada conference from the British Wesleyan conference. While there he married the sister of his deceased wife, and remained in Canada as pastor of a church. He visited the United States, preaching and lecturing in some of the principal cities. After the death of his second wife he returned to England, where at one time he was president of the British conference. He was a very popular preacher. He published *Life Thoughts*; *Sabbath Chimes*, in verse; *The Prodigal Son*; besides *Sermons and Addresses*.

PUNT, a heavy, oblong, flat-bottomed boat, useful where stability and not speed is needed. Punts are much used for fishing. Some are fitted for oars, but the more usual

mode of propulsion is by poles operating on the bottom. Punting is a very laborious exercise.

PUNTA ARENAS, a t. in Costa Rica, on the gulf of Nicoya, the port of San José, 60 m. northwest. The Pacific Mail and Panama railroad steamers stop here. It is connected with Cartago by telegraph. The climate is unhealthful, and the permanent population small.

PUPA (Lat. a girl, or a doll), the second stage of insect life after the hatching of the egg. The first stage after the egg is that of *Larva* (q.v.). In those insects of which the metamorphosis is *complete* (see INSECTS), the pupa is generally quite inactive, and takes no food. This is the case in the *lepidoptera*, the pupa of which is called a *chrysalis arevelia* and in the *coleoptera*, *hymenoptera*, and *diptera*. Manifestations of life may indeed be produced by touching, or in any way irritating, the pupa, but it is incapable of locomotion and of eating. It is quite otherwise with the pupæ of other orders, which are often very voracious, and resemble the perfect insect in almost everything but that the wings are wanting. The peculiarities of the pupa are noticed in the articles on the different orders and genera of insects.

PUPIL. See EYE.

PUPIL, in the law of Scotland, means, in the case of a male, one who is under 14 years of age; in the case of a female, one under the age of 12 years.

PUPPET, a name (derived from the Lat. *pupus*, a child or boy, Fr. *poupée*, a doll) signifying a childlike image. The Italic *fantoccini* (from *fantino*, a child), and the French *marionettes* (q.v.) are other names for puppets. Puppet-plays, or exhibitions in which the parts of the different characters are taken by miniature figures worked by wires, while the dialogue is given by persons behind the scenes, are of very ancient date. Figures with movable limbs have been found in the tombs of ancient Egypt and Etruria. Originally intended to gratify children, they ended in being a diversion for adults. In China and India they are still made to act dramas either as movable figures or as shadows behind a curtain ("ombres chinoises"). In Italy and France puppet-plays were at one time carried to a considerable degree of artistic perfection, and even Lessing and Goethe in Germany thought the subject worth their serious attention. In England they are mentioned under the name of *motions* by many of our early authors, and frequent allusions occur to them in the plays of Shakespeare, Ben Jonson, and the older dramatists. The earliest exhibitions of this kind consisted of representations of stories taken from the Old and New Testament, or from the lives and legends of saints. They thus seem to have been the last remnant of the *moralties* of the 15th century. We learn from Ben Jonson and his contemporaries that the most popular of these exhibitions at that time were the *Prodigal Son*, and *Nineveh with Jonas and the Whale*. Even the Puritans, with all their hatred of the regular stage, did not object to be present at such representations. In the reign of queen Elizabeth, puppet-plays were exhibited in Fleet street and Holborn bridge—localities infested by them at the period of the restoration. The most noted exhibitions of the kind were those of Robert Powell in the beginning of the 18th century. (See Chambers's *Book of Days*, vol. ii. 167.) So recently as the time of Goldsmith, scriptural "motions" were common, and, in *She Stoops to Conquer*, reference is made to the display of Solomon's temple in one of these shows. The regular performances of the stage were also sometimes imitated; and Dr. Samuel Johnson has observed that puppets were so capable of representing even the plays of Shakespeare, that *Macbeth* might be represented by them as well as by living actors. These exhibitions, however, much degenerated, and latterly consisted of a wretched display of wooden figures barbarously formed, and decorated without the least degree of taste or propriety, while the dialogues were jumbles of absurdities and nonsense.

The mechanism of puppet-plays is simple. The exhibitor is concealed above or below the stage, works the figures by means of wires, and delivers the dialogues requisite to pass between the characters. The exhibition of Punch (q.v.) is perhaps the only example of this species of acting which exists in this country at the present time.

PURĀNA (literally "old," from the Sanskrit *purā*, before, past), is the name of that class of religious works which, besides the Tantras (q.v.) is the main foundation of the actual popular creed of the Brahminical Hindus (see HINDU RELIGION under INDIA). According to the popular belief, these works were compiled by *Vyāsa* (q.v.), the supposed arranger of the *Vedas* (q.v.), and the author of the *Mahābhārata* (q.v.), and possess an antiquity far beyond the reach of historical computation. A critical investigation, however, of the contents of the *existing* works bearing that name must necessarily lead to the conclusion, that in their present form they do not only not belong to a remote age, but can barely claim an antiquity of a thousand years. The word *purāna* occurs in some passages of the *Mahābhārata*, the law-books of Yājñavalkya and Manu (q.v.); it is even met with in some *Upanishads* and the great Brāhman' a portion of the White-Yajur Veda; but it is easy to show that in all these ancient works it cannot refer to the existing compositions called Purāna, and, therefore, that no inference relative to the age of the latter can be drawn from that of the former, whatever that may be. Nevertheless, it must be admitted that there are several circumstances tending to show that there existed a number of works called Purāna, which preceded the actual works of the same name,

and were the source whence these probably derived a portion of their contents. The oldest known author of a Sanskrit vocabulary, Amara-Sinha, gives as a synonym of Purân'a the word *panchalakshan'a*, which means "that which has five (*panchan*) characteristic marks" (*lakshan'a*); and the scholiasts of that vocabulary agree in stating that these *lakshan'as* are: 1. Primary creation, or cosmogony; 2. Secondary creation, or the destruction and renovation of worlds; 3. Genealogy of gods and patriarchs; 4. *Manvantaras*, or reigns of Manus; and 5. The history of the princess of the solar and lunar races. Such, then, were the characteristic topics of a Purân'a at the time, it not of Amara-Sinha himself—which is probable—at least of his oldest commentators. Yet the distinguished scholar, most conversant with the existing Purân'as, who, in his preface to the translation of the *Vishn'u-Purân'a*, gives a more or less detailed account of their chief contents (prof. H. H. Wilson), observes, in regard to the quoted definition of the commentators on Amara-Sinha, that in no one instance do the actual Purân'as conform to it exactly; that "to some of them it is utterly inapplicable; to others, it only partially applies." To the *Vishn'u-Purân'a*, he adds, it belongs more than to any other Purân'a; but even in the case of this Purân'a he shows that it cannot be supposed to be included in the term explained by the commentators. The age of Amara-Sinha is, according to Wilson, the last half of the century preceding the Christian era; others conjecture that it dates some centuries later. On the supposition, then, that Amara Sinha himself implied by *panchalakshan'a* the sense given to this term by his commentators, there would have been Purân'as about 1900 or 1600 years ago; but none of these have descended to our time in the shape it then possessed.

Various passages in the actual Purân'as furnish proof of the existence of such elder Purân'as. The strongest evidence in this respect is that afforded by a general description given by the *Matsya-Purân'a* of the extent of each of the Purân'as (which are uniformly stated to be 18 in number), including itself; for, leaving aside the exceptional case in which it may be doubtful whether we possess the complete work now going by the name of a special Purân'a, prof. Wilson, in quoting the description from the *Matsya-Purân'a*, and in comparing with it the real extent of the great majority of Purân'as the completeness of which, in their actual state, does not admit of a reasonable doubt, has conclusively shown that the *Matsya-Purân'a* speaks of works which are not those we now possess. We are then bound to infer that there have been Purân'as older than those preserved, and that their number has been 18, whereas, on the contrary, it will be hereafter seen that it is very doubtful whether we are entitled to assign this number to the actual Purân'a literature.

The modern age of this latter literature, in the form in which it is known to us, is borne out by the change which the religious and philosophical ideas, taught in the epic poems and the philosophical Sûtras, have undergone in it; by the legendary detail into which older legends and myths have expanded; by the numerous religious rites—not countenanced by the Vedic or epic works—which are taught, and, in some Purân'as at least, by the historical or quasi-scientific instruction which is imparted, in it. To divest that which, in these Purân'as, is ancient, in idea or fact, from that which is of parasitical growth, is a task which Sanskrit philology has yet to fulfill; but even a superficial comparison of the contents of the present Purân'a with the ancient lore of Hindu religion, philosophy, and science, must convince every one that the picture of religion and life unfolded by them is a caricature of that afforded by the Vedic works, and that it was drawn by priestcraft, interested in submitting to its sway the popular mind, and unscrupulous in the use of the means which had to serve it sends. The plea on which the composition of the Purân'as was justified even by great Hindu authorities—probably because they did not feel equal to the task of destroying a system already deeply rooted in the national mind, or because they apprehended that the nation at large would remain without any religion at all, if, without possessing the Vedic creed, it likewise became deprived of that based on the Purân'as—this plea is best illustrated by a quotation from Sâyan'a, the celebrated commentator on the three principal Vedas. He says (*Rîg.*, ed. Müller, vol. i p. 33): "Women and Sûtras, though they, too, are in want of knowledge, have no right to the Veda, for they are deprived of (the advantage of) reading it in consequence of their not being invested with the sacred cord; but the knowledge of law (or duty) and that of the supreme spirit arises to them by means of the Purân'as and other books (of this kind)." Yet to enlighten the Hindu nation as to whether or not these books—which sometimes are even called a fifth Veda—teach that religion which is contained in the Vedas and Upanishads, there would be no better method than to initiate such a system of popular education as would reopen to the native mind those ancient works, now virtually closed to it.

Though the reason given by Sâyan'a, as clearly results from a comparison of the Purân'as with the oldest works of Sanskrit literature, is but a poor justification of the origin of the former, and though it is likewise indubitable, that even at his time (the middle of the 15th c. A.D.) they were, as they still are, not merely an authoritative source of religion for "women and Sûtras," but for the great majority of the males of other castes also, it nevertheless explains the great variety of matter of which the present Purân'as are composed, so great and so multifarious indeed, that, in the case of some of them, it imparts to them a kind of cyclopaedical character. They became, as it seems, the source of all popular knowledge; a substitute to the masses of the nation, not only

for the theological literature, but for scientific works, the study of which was gradually restricted to the leisure of the learned few. Thus, while the principal subjects taught by nearly all the Purana are cosmogony, religion, including law, and the legendary matter which, to a Hindu, assumes the value of history, in some of them we meet with a description of places, which gives to them something of the character of geography; while one, the *Agni-Purana*, also pretends to teach archery, medicine, rhetoric, prosody, and grammar; though it is needless to add that that teaching has no real worth.

One purpose, however, and that a paramount one, is not included in the argument by which Sāyan'a endeavored to account for the composition of the Purān'as—it is the purpose of establishing a sectarian creed. At the third phase of Hindu religion (q.v.), two gods of the Hindu pantheon especially engrossed the religious faith of the masses, Vishn'u (q.v.) and S'iva (q.v.), each being looked upon by his worshipers as the supreme deity, to whom the other as well as the remaining gods were subordinate. Moreover, when the power or energy of these gods had been raised to the rank of a separate deity, it was the female S'akti, or energy, of S'iva, who, as Durgā, or the consort of this god, was held in peculiar awe by a numerous host of believers. Now, apart from the general reasons mentioned before, a principal object, and probably the principal one of the Purān'as, was to establish, as the case might be, the supremacy of Vishn'u or S'iva, and it may be likewise assumed of the female energy of S'iva, though the worship of the latter belongs more exclusively to the class of works known as Tantrass. There are, accordingly, Vaishn'ava-Purān'as, or those composed for the glory of Vishn'u, S'aiva-Purana, or those which extol the worship of S'iva; and one or two Purān'as, perhaps, but merely so far as a portion of them is concerned, will be more consistently assigned to the S'ākta worship, or that of Durgā, than to that of Vishn'u or S'iva.

"The invariable form of the Purān'as," says prof. Wilson, in his *Preface to the Vishn'u-Purān'a*, "is that of a dialogue in which some person relates its contents in reply to the inquiries of another. This dialogue is interwoven with others, which are repeated as having been held, on other occasions, between different individuals, in consequence of similar questions having been asked. The immediate narrator is commonly, though not constantly, Lomaharshan'a, or Romaharshan'a, the disciple of Vyāsa, who is supposed to communicate what was imparted to him by his preceptor, as he had heard it from some other sage. . . . Lomaharshan'a is called Sūta, as if it was a proper name; but it is, more correctly, a title; and Lomaharshan'a was "a sūta," that is, a bard, or panegyrist, who was created, according to the *Vishn'u-Purān'a*, to celebrate the exploits of princes, and who, according to the *Vāyu* and *Padma Purān'as*, has a right, by birth and profession, to narrate the Purān'as, in preference even to the Brahmins."

The number of the actual Purān'as is stated to be 18, and their names, in the order given, are the following: 1. *Brahma-*; 2. *Padma-*, 3. *Vishn'u-*; 4. *S'iva-*; 5. *Bhāgavata-*; 6. *Nāradya-*; 7. *Mārkan'deya-*; 8. *Agni-*; 9. *Bhaviṣhya-*; 10. *Brahma-vaivarta-*; 11. *Linga-*; 12. *Vārāha-*; 13. *Skanda-*; 14. *Vāmana-*; 15. *Kūrma-*; 16. *Matsya-*; 17. *Garuḍa-*; and 18. *Brahmān'da-Purān'a*. In other lists the *Agni-Puran'a* is omitted, and the *Vāyu-Puran'a* inserted instead of it; or the *Garuḍa* and *Brahmān'da* are omitted, and replaced by the *Vāyu* and *Nr̥siṅha Purān'as*. Of these Purān'as, 2, 3, 5, 6, 10, 12, 17, are probably 1, are Purān'as of the Vaishn'ava sect; 4, 8, 11, 13, 15, 16, of the S'iva sect; 7 is, in one portion of it, called *Devimāhātmya*, the text-book of the worshipers of Durgā; otherwise, it has little of a sectarian spirit, and would therefore neither belong to the Vaishn'ava nor to the S'aiva class; 14, as prof. Wilson observes, "divides its homage between S'iva and Vishn'u with tolerable impartiality; it is not connected, therefore, with any sectarian principles, and may have preceded their introduction." The *Bhaviṣhya-Purān'a* (9), as described by the *Matsya-Purān'a*, would be a book of prophecies; but the *Bhaviṣhya-Purān'a* known to prof. Wilson consists of five books, four of which are dedicated to the gods Brahmā, Vishn'u, S'iva, and Twashtri; and the same scholar doubts whether this work could have any claim to the name of a Purān'a, as its first portion is merely a transcript of the words of the first chapter of Manu, and the rest is entirely a manual of religious rites and ceremonies. There are similar grounds for doubt regarding other works of the list.

If the entire number of works, nominally, at least, corresponding with those of the native list, were taken as a whole, their contents might be so defined as to embrace the five topics specified by the commentators on the glossary of Amara-Sinha; philosophical speculations on the nature of matter and soul, individual as well as supreme; small codes of law; descriptions of places of pilgrimage; a vast ritual relating to the modern worship of the gods; numerous legends; and exceptionally, as in the *Agni-Purān'a*, scientific tracts. If taken, however, individually, the difference between most of them, both in style and contents, is so considerable that a general definition would become inaccurate. A short description of each Purān'a has been given by the late prof. H. H. Wilson, in his preface to his translation of the *Vishn'u-Purān'a*; and to it, as well as to his detailed account of some Purān'as in separate essays (collected in his works), we must therefore refer the reader who would wish to obtain a fuller knowledge of these works.—The age of the Purān'a, though doubtless modern, is uncertain. The *Bhāgavata*, on account of its being ascribed to the authorship of the grammarian Vopadeva, would appear to yield a safer computation of its age than the rest; for Vopadeva lived in the 12th c., or, as some hold, 13th c., after Christ; but this authorship, though probable, is not proved to a cer-

taint. As to the other Purān'as, their age is supposed by prof. Wilson to fall within the 12th and 17th centuries of the Christian era, with the exception, though, of the *Mārkan'd'eya-Purān'a*, which, in consideration of its unsectarian character, he would place in the 9th or 10th century. But it must be borne in mind that all these dates are purely conjectural, and given as such by the scholar whose impressions they convey.

Besides these eighteen Purān'as or great Purān'as, there are minor or *Upapurān'as*, "differing little in extent or subject from some of those to which the title of Purān'a is ascribed." Their number is given by one Purān'a as four; another, however, names the following 18: 1. *Sanatkumāra*.; 2. *Nārasinha*.; 3. *Nirādīya*.; 4. *Siva*.; 5. *Durgāsasa*.; 6. *Kāpila*.; 7. *Mānava*.; 8. *Ausānasa*.; 9. *Vārca*'a.; 10. *Kālikā*.; 11. *Sāmba*.; 12. *Nandi*.; 13. *Saura*.; 14. *Pārās'ara*.; 15. *Adītya*.; 16. *Māhes'wara*.; 17. *Bhāgavata* (probably, however, a misreading for *Bhārgava*); and 18. *Vās'ishtha-Upapurān'a*. Another list, differing from the latter, not in the number, but in the names of the Upapurān'as, is likewise given in prof. Wilson's *Preface to the Vishn'u-Purān'a*. Many of these Upapurān'as are apparently no longer procurable, while other works so called, but not included in either list, are sometimes met with; for instance, a *Mudgala* and *Ganes'a Upapurān'a*. The character of the Upapurān'as is, like that of the Purān'as, sectarian; the *Siva-Upapurān'a*, for instance, inculcates the worship of S'iva, the *Kālikā-Upapurān'a* that of Durgā or Devi.

Both Purān'as and Upapurān'as are for a considerable portion of their contents largely indebted to the two great epic works, the *Mahābhārata* (q.v.) and *Rāmāyan'a* (q.v.), more especially to the former of them. Of the Purān'as, the original text of three has already appeared in print: that of the *Bhāgavata* in several native editions, published at Bombay, with the commentary of S'ridharaswāmin, and partly in a Paris edition by Eugène Burnouf, which remained incomplete through the premature death of that distinguished scholar; that of the *Mārkan'd'eya-Purān'a*, edited at Calcutta in the *Bibliotheca Indica*, by the rev. K. M. Banerjæ; and that of the *Linga-Purān'a*, edited at Bombay for, regarding a fourth, the *Garud'a-Purān'a*, edited at Benares and Bombay, it seems doubtful whether that little work is the same as the Purān'a spoken of in the native list. Besides these, small portions from the *Padma*, *Skanda*, *Bhacishyottara*, *Mārkan'd'eya*, and other Purān'as have been published in India and Europe. Of translations we have only to name the excellent French translation by Burnouf of the first nine books of the *Bhāgavata*, and the elegant translation of the whole *Vishn'u-Purān'a*, together with valuable notes by the late prof. H. H. Wilson, which has recently been republished in his works, in a new edition, amplified with numerous notes, by prof. F. E. Hall.—For general information on the character and contents of the Purān'as, see especially Wilson's preface to his translation of the *Vishn'u-Purān'a* (Works, vol. vi., Lond. 1864), Burnouf's preface to his edition of the *Bhāgavata* (Paris, 1840), Wilson's *Analysis of the Purān'as* (Works, vol. iii., Lond. 1864, edited by prof. R. Rost), K. M. Banerjæ's *Introduction to Mārkan'd'eya* (Calcutta, 1862), and John Muir's *Original Sanskrit Texts on the Origin and History of the People of India*, vols. i. to v. (Lond. 1858-71).

PURBECK, ISLE OF, a district in the south of Dorsetshire, 14 m. in length from w. to e., and 7 m. in breadth, is bounded on the n. by the river Frome and Poole harbor, on the e. and s. by the English channel, and on the w. by the stream of Luckford lake, which, rising in the park of Lulworth castle, flows n. and joins the Frome. On the w., however, the water-boundary is not complete, the district being connected with the main portion of the co. at East Lulworth, and the so-called isle of Purbeck is therefore really a peninsula. In ancient times the isle of Purbeck was a royal deer-forest. See **PURBECK BEDS** and **PURBECK MARBLE**.

PURBECK BEDS, a group of strata forming the upper members of the oolitic period (q.v.), and so named because they are well developed in the peninsula called the isle of Purbeck (q.v.), s. of Poole estuary in Dorsetshire. They are, like the Wealden beds above them, chiefly fresh-water formations; but their organic remains join them more closely to the marine-formed oolites below than to the superior Wealden series. Though of a very limited geographical extent, the Purbeck beds have yet considerable importance from the changes in animal life that took place during their deposition. Generally less than 200 ft. in thickness, they, however, exhibit three distinct and peculiar sets of animal remains. This has caused them to be arranged into three corresponding groups, known as the upper, middle, and lower Purbecks.

The upper Purbecks are entirely fresh-water, and the strata are largely charged with the remains of shells and fish; the cases of the entomostraca cyprides are very abundant and characteristic. The building-stone called Purbeck marble belongs to this division.

The middle Purbecks record numerous changes during their deposition. The newest of the strata consists of fresh-water limestone, with the remains of cyprides, turtles, and fish. This rests on brackish water-beds—cyrena with layers of corbula and melania. Below this there are marine strata, containing many species of sea-shells. Then follow some fresh and brackish-water limestone and shales, which again rest on the cinder-bed, a marine argillaceous deposit, containing a vast accumulation of the shells of a small oyster. This is preceded by fresh-water strata, abounding in the remains of entomostraca, and containing some beds of cherty limestone, in which little bodies, believed to

have been the spore-cases of species of chara, have been found. At the base of this sub group, a marine shale occurs, containing shells and impressions apparently of a large zosteria.

The lower Purbecks begin with a series of fresh-water marls, containing entomostraca and shells. These rest on strata of brackish-water origin; and then follows a singular old vegetable soil, containing the roots and stools of cycads, and the stems of coniferous trees. From its black color and incoherent condition, this layer has received from the quarrymen the name of the "dirt-bed" (q. v.). This rests on the basement-bed of the whole group, which is a fresh-water limestone, charged with entomostraca and shells, and contains the thin layer in which Mr. Beckles has lately found the remains of several species of mammalia.

PURBECK MARBLE is an impure fresh-water limestone, containing immense numbers of the shells of paludina, from which it derives its "figure" when polished. It was formerly much used in the internal decoration of churches and other buildings in the southern counties of England. It is quarried in the peninsula of Purbeck, in Dorsetshire, and belongs to the upper section of the Purbeck beds (q. v.).

PURCELL, HENRY, the most eminent of English musicians, was b. at Westminster in 1658, and was son of Henry Purcell, one of the gentlemen of the chapel-royal appointed at the restoration. He lost his father at the age of six, and was indebted for his musical training to Cook, Humphreys, and Dr. Blow. His compositions at a very early age showed evidence of talent. In 1676 he was chosen to succeed Dr. Christopher Gibbons as organist of Westminster abbey; and in 1682 he was made organist of the chapel-royal. He wrote numerous anthems and other compositions for the church, which were eagerly sought after for the use of the various cathedrals, and have retained their place to the present day. Purcell's dramatic and chamber compositions are even more remarkable. Among the former may be mentioned his music to the *Tempest*, his songs in Dryden's *King Arthur*, his music to Howard's and Dryden's *Indian Queen*, to Urley's *Don Quixote*, etc. A great many of his cantatas, odes, glees, catches, and rounds are yet familiar to lovers of vocal music. In 1683 he composed twelve sonatas for two violins and a bass. Purcell studied the Italian masters deeply, and often made reference to his obligations to them. In originality and vigor, as well as harmony and variety of expression, he far surpassed both his predecessors and his contemporaries. His church music has been collected and edited from the original MS. by Mr. Vincent Novello, in a folio work which appeared in 1826-36, with a portrait and essay on his life and works. He died of consumption in 1695, and was buried in Westminster abbey.

PURCELL, JOHN BAPTIST, D.D., b. Ireland, 1800; educated at Emmitsburg, Md., and at Paris, where he was ordained a Roman Catholic priest in 1826; became professor in Mount St. Mary's college, Emmitsburg, and was its president 1829-33. In 1833 he was consecrated bishop of Cincinnati, and in 1850 archbishop. He has published *Lectures and Pastoral Letters*; *Life of X. D. McLeod*; and *The Roman Clergy*.

PURCHAS, SAMUEL, 1577-1628; b. at Thaxted, Essex, England; studied at Cambridge; obtained the vicarage of Eastwood, but committing the cure to his brother, he settled in London for the greater advantage of preparing and printing the collection of travels which he had commenced. He published the first volume in 1613, and the last four 12 years later under the title, *Purchas: His Pilgrimage, or Relations of the World, and the Religions Observed in All Ages and Places Discovered from the Creation unto this Present*. In 1615 he was made bachelor of divinity at Oxford, and became rector of St. Martin's, Ludgate, in London, and chaplain to Dr. Abbott, archbishop of Canterbury. The publication of his works brought him into debt. He published also *Microcosmus, or the History of Man*; *The King's Tower and Triumphal Arch of London*; *A Funeral Sermon*.

PURCHASE-SYSTEM, a highly unpopular and much misunderstood arrangement in the British army, by which a large proportion—more than half—of the first appointments of officers and their subsequent promotion used to be effected. It dates from the first formation of an English standing army, and was formally recognized in the reign of queen Anne. The system itself was very simple. A price was fixed by regulation for each substantive rank (see PROMOTION), viz.:

	Price.	Difference.
Lieutenant-colonel.....	£4500	£1300
Major.....	3200	1400
Captain.....	1800	1100
Lieutenant.....	700	250
Cornet or ensign.....	450	

When any officer holding one of these regimental commissions desired to retire from the army, he was entitled to sell his commission for the price stipulated in the above table—£4,500 in the case of a lieutenant-col. This sum was made up by the senior maj., who was willing and able to purchase, buying the rank of lieutenant-col. for £1300; the senior capt., willing and able to purchase, buying a majority for £1400; a lieutenant, purchasing his company for £1100; a cornet or ensign becoming lieutenant, on payment of £250; and, lastly, by the sale to some young gentleman of an ensigney or cornetey for £450. In practice,

fancy prices higher than the above were usually given, according to the popularity of a regiment, and vested interests in these over-regulation prices caused most serious complications whenever the government made any change affecting the promotion of purchase officers. The value of commissions in the guards was also greater; but as they constitute but a few regiments, and are mostly officered from the nobility, they do not need particular description.

No commission could be purchased by one officer unless another officer vacated his commission by its sale. Death vacancies, vacancies caused by augmenting a regiment, vacancies resulting from the promotion of colonels to be major-generals, were filled without purchase, usually by seniority. No rank above lieutenant-col. could be purchased.

It is alleged with truth that purchase enabled the rich man to step over the head of the poorer but perhaps better qualified non-purchasing officer; and that money decided where merit should be the only guide. These disadvantages, however, it is replied, were not unmixed. Purchase, it is argued, introduced into the army men of a very high class in society, who gave a tone to the whole of military life. A great proportion of these wealthy men entered with the intention of merely spending a few years in the army. This tended to keep the officers young—a great advantage; and, further, provided in the country, among its gentlemen, a body of men well adapted for commands in the militia and volunteers. Moreover, selection exercised arbitrarily, as it must be when the men from whom the selection is to be made are scattered all over the world, away from the selecting power, is liable to create dissatisfaction. Under purchase, exchange was a common thing; for the rich officers, for private reasons of locality, etc., were glad to change frequently from regiment to regiment, entering in each case at the bottom of the list of officers of their rank in their new regiment. This, of course, was an advantage to the non-exchanging officer, as it pushed him to the top; and the first death or other non-purchase promotion then fell to him. An officer who had not purchased at all might, nevertheless, sell his commission for its full value if he had served 20 years, or for a sum less than the regulated price after shorter service. This was also a spur to promotion. On the whole, though exposed to the disadvantage and annoyance of being passed over by younger officers, the non-purchasing, i.e., the poor officers benefited pecuniarily by the purchase-system. This is proved by the slow progress officers made in corps where purchase did not exist, as, for instance, in the royal marines. Few would counsel the formation of a new army with such a system as purchase; but, on the other hand, it had its advantages in its working. Purchase did not exist in the artillery, engineers, marines, 19th to 21st regiments of cavalry, or 101st to 109th regiments of foot. The purchase-system was abolished by royal warrant in July, 1871; and by the regulation of the forces act of the same year, parliament laid down a scheme for the gradual compensation of officers who had lost their selling rights. Under that scheme it is expected that a sum-total amounting to nearly £8,000,000 will be required.

PURCHASER. See SALE.

PURCHAS JUDGMENT, delivered by the judicial committee of the privy council in *Herbert v. Purchas*, an appeal from the Canterbury court of arches brought in 1871. The defendant or respondent was charged with improperly conducting public service at St. James's chapel, Brighton, England. The principal offenses were the use of the mixed chalice, of a cap or beretta, of "holy water," and of wafer-bread in the eucharist, the wearing of certain vestments, and the turning of his back to the people at certain stages of the service. The decision of the court was adverse to Mr. Purchas on all points except that relating to the beretta. The judgment was rendered on an *ex parte* hearing, as the respondent was provided with funds to procure counsel only after the decision was pronounced; his petition for a rehearing of the case was refused, and the course of the court in so doing was the subject of much unfavorable comment. Mr. Purchas was compelled to pay the costs and admonished to discontinue the prohibited practices. He refused to comply, and in 1872 was suspended, and his property sequestered to pay the costs. He died in Oct., 1872.

PURFLED, or **PURFLEWED**, in heraldry, a term used with reference to the lining, bordering, or garnishing of robes, or ornamentation of armor.

PURGA TION. See ORDEAL.

PURGATIVES are medicines which, within definite and comparatively short time after exhibition, produce the evacuation of the bowels. The remedies included under this head have, however, various modifications of action, which adapt them for the fulfillment of different therapeutic applications. They are divided by Pereira into five groups, viz.:

1. *Laxatives*.—A purgative is said to be laxative when it operates so mildly as merely to evacuate the intestines without occasioning any general excitement of the system, or any extraordinary increase of watery secretion from the capillaries of the alimentary canal. This group includes manna, sulphur, cassia pulp, castor oil, etc.; and purgatives of this kind are employed when we wish to evacuate the bowels with the least possible irritation, as in children and pregnant women; in persons suffering from hernia, piles, stricture or prolapsus of the rectum, etc.

2. *Saline or Cooling Purgatives*, such as sulphate of magnesia, and potassio-tartrate of

soda, either in simple solution or in the form of scidlitz powder (q.v.). They give rise to more watery evacuations than the members of the preceding group, and are much employed in inflammatory and febrile cases.

3. *Milder Aerial Purgatives*, such as senna, rhubarb, and aloes. They possess acrid and stimulating properties, and are intermediate in activity between the last and the next group. Senna (generally in the form of black draught) is employed when we want an active but not very irritant purgative. Rhubarb is especially adapted for patients when there is a want of tone in the alimentary canal. Aloes is used in torpid conditions of the large intestine; but as this drug irritates the rectum it should be avoided in cases of piles and of pregnancy, especially if there is any threatening of miscarriage.

4. *Drastic Purgatives*, such as jalap, scammony, gamboge, croton oil, colocynth, and elaterium, when swallowed in large doses, act as irritant poisons, and are employed in medicine when the bowels have resisted the action of milder purgatives, or when we wish to exert a powerful derivative action upon the intestinal mucous membrane (as in cases of apoplexy, when croton oil is commonly used), or when it is necessary to remove a large quantity of water from the system, as in dropsical affections, in which case, elaterium, from its hydragogue power, is usually employed.

5. *Mercurial Purgatives*, the chief of which are calomel, blue pill, and gray powder. They are commonly given with the view of increasing the discharge of bile, although their power in this respect has recently been denied. As their action is uncertain, they are usually combined with or followed by other purgatives. Podophyllin (q.v.) has recently been much used for the purpose of exciting bilious evacuations. Hamilton's book *On Purgative Medicines*, which was published more than half a century ago, is still the standard work on the subject of this article.

PURGATORY (Lat. *purgatorium*, from *purgo*, I cleanse), is the name given, in the Roman Catholic and Oriental churches, to a place of purgation, in which, according to their religious system, souls after death either are purified from venial sins (*peccata venialia*), or undergo the temporal punishment which, after the guilt of mortal sin (*peccata mortalia*) has been remitted, still remains to be endured by the sinner. The ultimate eternal happiness of their souls is supposed to be secured; but they are detained for a time in a state of purgation, in order to be fitted to appear in that presence into which nothing imperfect can enter. As there is some obscurity and much misunderstanding on this subject, we shall briefly explain the doctrine of Catholics, as collected from authentic sources, distinguishing those things which are held by them as "of faith," from the opinions which are freely discussed in their schools. Catholics hold as articles of their faith (1) that there is a purgatory in the sense explained above, and (2) that the souls there detained derive relief from the prayers of the faithful and from the sacrifice of the mass. The Scriptural grounds alleged by them in support of this view are 2d Macc. xii. 43-46 (on which they rely, not merely on the supposition of its being inspired, but even as a simple historical testimony), Matt. xii. 32, 1st Cor. iii. 11-15, 1st Cor. xv. 29; as well as on certain less decisive indications contained in the language of some of the Psalms—as xxxvii. (in Auth. Vers. xxxviii.) 1, and lxx. 12. And in all these passages they argue not alone from the words themselves, but from the interpretation of them by the fathers, as containing the doctrine of a purgatory. The direct testimonies cited by Catholic writers from the fathers to the belief of their respective ages as to the existence of a purgatory, are very numerous. We may instance among the Greeks: Clement of Alexandria, *Stromata*, vii. 12; Origen, *Hom.* xvi. c. 5, 6 in *Jeremiam*; vi. *Hom.* in *Exod.*; xiv. *Hom.* in *Levit.*; xxviii. *Hom.* in *Numb.*; Eusebius, *De Vita Constantini*, iv. 71; Athanasius, *Quest.* xxxiv. *ad Antioch.*; Cyril of Jerusalem, *Cat. Mystag.* v. 9; Basil, *Hom.* in *Psal.* v. 7; Gregory of Nazianzen, xli. *Orat. de Laude Athanasii*; Gregory of Nyssa, *Orat. de Bapt.*; as also Epiphanius, Ephrem, Theodoret, and others. Among the Latins: Tertullian, Cyprian, Arnobius, Lactantius, Hilary, Ambrose, and, above all, Augustine, from whom many most decisive passages are cited; Paulinus of Nola; and Gregory the great, in whom the doctrine is found in all the fullness of its modern detail. The epitaphs of the catacombs, too, supply Catholic controversialists with some testimonies to the belief of a purgatory, and of the value of the intercessory prayers of the living in obtaining not merely repose, but relief from suffering, for the deceased; and the liturgies of the various rites are still more decisive and circumstantial. Beyond these two points, Catholic faith, as defined by the council of Trent, does not go; and the council expressly prohibits the popular discussion of the "more difficult and subtle questions, and everything that tends to curiosity, or superstition, or savors of filthy lucre." Of the further questions as to the nature of purgatory, there is one of great historical importance, inasmuch as it constitutes one of the grounds of difference between the Greek and Latin churches. As to the existence of purgatory, both these churches are agreed; and they are further agreed that it is a place of suffering; but, while the Latins commonly hold that this suffering is "by fire," the Greeks do not determine the manner of the suffering, but are content to regard it as "through tribulation." The decree of union in the council of Florence (1439) left this point free for discussion. Equally free are the questions as to the situation of purgatory; as to the duration of the purgatorial suffering; as to the probable number of its inmates; as to whether they have, while there detained, a certainty of their ultimate salvation; and whether a "particular judgment"

takes place on each individual case immediately after death.—See Bellarminus, *De Purgatorio*; Suaresius, *De Purgatorio*; and on the Greek portion of the subject, Leo Allatius, *De utriusque Ecclesie in Dogmate de Purgatorio perpetua Consensione*.

The mediæval doctrine and practice regarding purgatory were among the leading grounds of the protests of the Waldenses and other sects of that age. The reformers, as a body, rejected the doctrine.

What is called the "historical," or critical view of its genesis, is well given by Neander (*Dogmengeschichte*, vol. i.). He conceives that its source is to be sought for in the ancient Persian doctrine of a purifying conflagration which was to precede the victory of Ormuz, and consume everything that was impure. From the Persians it passed with modifications to the Jews, and from them found its way into the ethical speculations of the more cultivated Christians. It harmonized admirably with the wide-spread philosophical notion borrowed by the Gnostic Christians from Neo-platonism, that matter is inherently evil. If, then, the *body* was to rise, it must be purged of evil, and the instrument of purification—fire—was at hand for the purpose. Moreover, the high and pure conception of the character of God revealed in the New Testament, necessitating a corresponding moral excellence on the part of his worshippers—"without holiness shall no man see the Lord"—must have greatly assisted in the establishment of the doctrine, for how could men, only lately gross heathens, possessing yet but the rudiments of the new faith, and with most of their heathen habits still clinging about them, be pronounced "holy," or "fit for the presence of God?" Their "faith" in Christ was sufficient to save them, but the work of sanctification was incomplete when they died, and must go on. Probably it was a strong Christian feeling of this sort that determined the reception of the doctrine of purgatory into the creed of the Catholic church, rather than any Gnostic philosophizings, though the Neo-platonic divines of Alexandria are the first to mention it.

Protestants generally reply to the arguments of Roman Catholics on the subject of purgatory, by refusing to admit the authority of tradition or the testimonies of the fathers, and at the same time by alleging that most—if not all—of the passages quoted from the fathers, as in favor of purgatory, are insufficient to prove that they held any such doctrine as that now held by the Roman Catholic church, some of them properly relating only to the subject of prayer for the dead, and others to the doctrine of limbus (q. v.). That the doctrine of purgatory is the fair development of that which maintains that prayer ought to be made for the dead, Protestants generally acknowledge, but refuse to admit, that the fathers carried out their views to any such consequence. As to the alleged evidences from Scripture, they are commonly set aside by Protestants as merely ridiculous. The much-vaunted argument from the second book of Maccabees, is of course contemned, as being from an apocryphal book, and not one of the best books of the Apocrypha; besides, that the passage relates to nothing more than prayer for the dead. The text Matt. xii. 32 is explained as relating to the final judgment: and 1 Cor. iii. 11–15, as relating to a trial of *works*, and not of persons; while 1 Cor. xv. 29 is regarded as having nothing more to do with the subject than any verse taken at random from any part of the Bible.

PURGING NUT. See PHYSIC NUT.

PURIFICATION, in a biblical sense, is the act through which an individual became fit to approach the Deity, or to mix freely in the community, in cases where a certain bodily or other disability had kept him out of the pale of the latter. The purification consisted chiefly in expiations, ablutions, sometimes accompanied by special sacrifices. Priests and Levites were consecrated for the divine service by "purification;" proselytes had to undergo it at baptism; and special religious acts could only be performed by those who had "bathed their bodies." Generally, no one was allowed to enter the temple or synagogue without having washed or "sanctified" himself; and in the post-exilic period, bathing was considered (chiefly by the Pharisees and Essenes) as one of the chief duties of piety. In general, the Mosaic law distinguishes between "clean" and "unclean" persons as well as things, calling "unclean" all that with which an Israelite is not to come in contact. It has been erroneously assumed that all the Levitical laws of purity and purification have a physical or medical reason—that is, that infection was to be prevented through them; but this can only have been the case in some instances. At the same time, we cannot deny that we are at a loss for the general principle on which they were based. There can be no doubt that cleanness, like every other virtue, if not enforced on religious grounds, would have had few devotees in those days, and among an eastern people; while, again, a hot climate requires a much greater attention to outward purity than more temperate zones. Compared with the Indian and Persian laws in this respect, the Jewish ones seem much less minute and harassing. For the purification, from the severer kinds of uncleanness, a certain "water of uncleanness" (Lev. xv.) was prepared; and the different acts to be performed for the re-admission of the leper into the community (Lev. xiv. 4–32), show plainly that his was considered the last stage of impurity. Identical with the first stage of the leper's purification are the ceremonies to be performed in the case of infected houses and garments. The sixth Seder of the Mishnah, in 11 treatises (there is no Gemara to this portion, except to Niddah), contains the most detailed regulations (as fixed by tradition) on this point. The washing of hands, we may add in conclusion, was in later times considered ritually necessary, in accordance

with the Talmudical maxim, that "every table should properly be sanctified into an altar." See UNCLEANNESS.

All the Jewish ceremonial purifications are commonly regarded by Christian theologians as emblematic of the necessity of holiness in the people of the Lord, and particularly in all acts of worship.

PURIFICATION OF THE BLESSED VIRGIN MARY, FEAST OF, a festival in commemoration of the "purification" of the Blessed Virgin Mary, in accordance with the ceremonial law of Lev. xii. 2. This ceremony was appointed for the fortieth day after childbirth, which, reckoning from Dec. 25 (the nativity of our Lord), falls upon Feb. 2, on which day the purification is celebrated. The history of Mary's compliance with the law is related in Luke ii. 22-24; and as on the same occasion she complied also with the law of Numb. xviii. 15, by the offering prescribed in redemption of the first-born, the festival is also called by the name of the "Presentation of the Child Jesus," or the "Feast of Simeon," and sometimes, also, "of the Meeting" (*occursus*), in allusion to Simeon's meeting the Virgin mother, and taking the child into his arms (Luke ii. 25). The date of the introduction of this festival is uncertain. The first clear trace of it is about the middle of the 5th c., during the reign of Marcia, and in the church of Jerusalem. Its introduction in the Roman church in 494 was made, by pope Gelasius, the occasion of transferring to a Christian use the festivities which at that season were annexed to the pagan festival of the Lupercalia.

PURIM, the festival instituted by Mordecai at the suggestion of Esther, to commemorate the deliverance of the Jews in Persia from the massacre with which they were threatened through the plots of Haman. The Hebrew word signifies *lot*, and the festival was probably called Purim in irony, Haman having cast lots to ascertain the auspicious day for executing the bloody decree of the king. The festival is observed on the 14th and 15th of Adar. According to modern custom the previous day is kept as a fast day, called the fast of Esther. Some fast three days, as Esther first enjoined. As soon as the stars appear on the evening of the 14th candles are lighted in token of rejoicing, and the people assemble in the synagogue. After a short prayer and thanksgiving the book of Esther, written on a separate parchment called Megillah, is read through. When the name Haman is read the congregation cry out, "May his name perish!" and the children spring rattles and make other noises. When the reading of the Megillah is finished the whole congregation exclaim, "Cursed be Haman; blessed be Mordecai; cursed be Zorsh (wife of Haman); blessed be Esther; cursed be all idolators; blessed be all Israelites; and blessed be Harbonah, who hanged Haman." In the morning service in the synagogue is read the law which relates the destruction of the Amalekites, the supposed ancestors of Haman. The rest of the day is spent in festivity, sending presents to one another, and bestowing alms on the poor, followed by plays and masquerades.

PURITANS, a name first given, according to Fuller in 1564, and according to Strype in 1569, to those clergymen of the church of England who refused to conform to its liturgy, ceremonies, and discipline as arranged by archbishop Parker and his Episcopal coadjutors. But in point of fact, the puritan tendency in the church of England is as old as the church itself; and to seek for its true origin we must go back to the period of Cranmer, who, when laying the foundations of English Protestantism in a nation only half-prepared for the change, found it necessary to make concessions to the older religion, and to build the new church on an elaborate system of compromise. This feature of "Anglicanism"—its essential *broad-churchism*—gave great offense to the stricter and more doctrinal of the English reformers, who neither cared nor were competent to look at the thing from a statesman's point of view. The reign of Edward VI., brief though it was, showed quite clearly that if the party in the English church who had acquired not only their theology, but their opinions of church government from Calvin, ever got the upper hand, they would not stop till they had reconstructed, on a much simpler basis, the whole ecclesiastical fabric. The reaction under Mary drove most of them to seek safety in exile on the continent. It was here the first definite step in the history of puritanism was taken. A number of the exiles resident at Frankfurt determined to adopt the Genevan service-book in preference to that appointed by king Edward, and though their attempt proved a failure, partly on account of the opposition of others of the exiles, yet it showed the pertinacity with which they tried to carry their convictions into practice. On their return to England, after the accession of Elizabeth, the struggle was renewed. But the virile queen would not tolerate their notions, and during her whole reign punished in the most stringent style all who refused to obey the Episcopal ordinances. The position assumed by the puritans was that the liturgy, ceremonies, and discipline of the church of England required further reformation; that the church, as then constituted, did not separate itself markedly enough from Roman Catholicism; and that it was desirable, in the interests of religion, to abandon everything that could boast of no other authority than tradition or the will of man, and to follow as far as possible the "pure" word of God. Hence their name, which was probably given in derision. In spite of the sharpest repressive measures their principles gradually spread among the serious portion of the laity, who were also called puritans. But the name appears not to have been confined to those who wished for certain radical changes in the forms of the church. The character that generally accompanied this wish led naturally

enough to a wider use of the term; hence, according to Sylvester, "the vicious multitude of the ungodly called all puritans that were strict and serious in a holy life, were they ever so conformable." This is the sense in which the Elizabethan dramatists use the word. From this very breadth of usage one sees that there were different degrees of puritanism. Some would have been content with a moderate reform in the rites, discipline, and liturgy of the church; others (like Cartwright of Cambridge) wished to abolish Episcopacy altogether, and to substitute Presbyterianism; while a third party, the Brownists or Independents (q. v.), were out-and-out dissenters, opposed alike to Presbyterianism and Episcopacy. During the reigns of James I. and Charles I. the spirit of puritanism continued more and more to leaven English society and the English parliament, although the most violent efforts were made by both monarchs to extirpate it. The tyrannical proceedings of Laud and of the Laudian bishops, and the outrages practiced by Charles on the English constitution, led many who were not at all Genevan in their ideas to oppose both church and king for the sake of the national liberties. Hume distinguishes three kinds of puritans: 1, The *political puritan*, who disliked the bishops, not so much on ecclesiastical grounds, as on account of their servility toward the king, and their priestly antipathy to civil liberty; 2, The *puritans in church discipline*, who were for the most part in favor of Presbyterianism; 3, The *doctrinal puritans*, who were strong Calvinists on such points as predestination, free-will, grace, etc., but were not opposed to Episcopacy or to the ecclesiastical authority of the monarch, and who contented themselves with assailing the Arminianism that was encouraged at court. The attitude of this third class was certainly anomalous, and it is not wonderful that they exercised so little influence or control on the march of events in the great civil struggle. The second class was by far the most numerous—at least among the clergy; and at first it seemed as if the clergy were going to have things all their own way. For example, in the memorable "Westminster assembly of divines" (1643), the great majority of the ministers were Presbyterians, and their *Confession of Faith* is quite a Presbyterian affair. But genius, energy—the arms of victory—belonged to the more advanced puritans, who were predominant in the army and the parliament, and ultimately triumphed in the person of Cromwell (q. v.). But the restoration (1660) brought back Episcopacy, and the act of uniformity (1662) threw the puritans of the church into the position of dissenters. Their subsequent history is treated under the different forms of dissent. Before the civil war broke out, so great were the hardships to which the puritans were exposed that many of them emigrated to America, to seek liberty and peace on the solitary shores of the new world. There they became the founders of the New England states, and cultivated unmolested that form of Christianity to which they were attached. Nowhere did the spirit of puritanism in its evil as well as its good more thoroughly express itself than in Massachusetts and Rhode Island; nor have its traces wholly disappeared even yet. In Scotland puritanism, in the shape of Presbyterianism, was from the first the established religion; hence it does not present itself to us in that country as a struggling, suffering, antagonistic, and protesting force; nor, in point of fact, was the name of puritan ever given even to the extremest sect of Covenanters.—See Neale's *History of the Puritans*; Price's *History of Nonconformity*; Macaulay's *History of England*; and Dr. Stoughton's *Works*.

PURL, a beverage now little used except among the lower classes in and around London. It is made by warming a pint of ale with a quarter of a pint of milk, and adding some sugar and a wine-glassful of gin, rum, or brandy.

PURLINS, pieces of timber used in framed roofs between the principals, for the support of the common rafters.

PURMEREND, a flourishing little t. in n. Holland, 10 m. n. of Amsterdam, and on the line of the great canal from that city to the North sea. Pop. '75, 4,783. It has a large trade in cheese, butter, eggs, cattle, and wood, upward of 1,500,000 lbs. of cheese being annually sold in the market. In the neighborhood of Purmerend are to be found the richest meadows, the finest cattle, the neatest farm-houses, and the most perfect dairies and cow-stables. Purmerend has also a considerable shipping trade, and imports timber. The town, which sprang up under the protection of the castle of Purmerstein (built at the beginning of the 15th c.), derives its name from being situated at the end of the Purmer, formerly a sheet of water, by drainage made a fertile tract of land containing 6,701 acres.

PURNEAH, a large t. of British India, capital of an extensive and populous district of the same name in the presidency of Bengal, on the n. bank of the Ganges, stands on both banks of the Little Kosi river, 230 m. n.w. of Calcutta. It covers a considerable area, but it is not compactly built, there being numerous plantations, gardens, and other open places within the boundaries. Around the town are numerous straggling villages. A considerable quantity of indigo is grown in the vicinity. The civic establishment consists for the most part of Europeans. Pop. '72, of town, 16,057; of district, 1,714,795.

PURPLE OF CASSIUS, or GOLD PURPLE, a beautiful coloring material of a vitreous character, which was made known in Germany in the 17th c. by an artist named Andrew Cassius, whose father was secretary to the duke of Sleswick. Its property is to give a beautiful ruby red to glass, and it was therefore, and still is, employed to make imita-

tion rubies. It is made by combining one part of neutral chloride of gold with a mixture of one part of protochloride and two parts of perchloride of tin, all in solution. When mixed together, a beautiful purple precipitate is the result, which is the purple of Cassius. The French recipe, which is said to be the best, is 10 parts of acid chloride of gold dissolved in 2,000 parts of distilled water. To this add a solution, carefully prepared, in another vessel, of 10 parts of pure tin in 20 parts of muriatic acid diluted with 1000 parts of water. On mixing the two, the purple precipitate is thrown down, and is separated by filtering and decantation.

PURPLE COLORS. Painters in oil and water colors produce the various shades of purple by the admixture of pure red and pure blue colors. Dyers obtain this color from various sources, all of which are curious and interesting. From a very early period, purple has been one of the most highly prized of all colors, and came to be the symbol of imperial power. Probably one great reason for this was the enormous cost of the only purple color known to the ancients, the Tyrian purple, which was obtained in minute quantities only from a Mediterranean species of molluscous animal or shell-fish, the *murex trunculus*, and perhaps also *purpura lapillus*. In the time of Cicero, wool double-dyed with this color was called *dibapha*, and was so excessively dear, that a single pound-weight cost a thousand denarii, or about £35 sterling. A single murex only yields a small drop of the secretion, consequently very large numbers had to be taken in order to obtain enough to dye even a small amount of wool. Tarentum, the modern Otranto, was one of the great murex fisheries of the Romans, and there they had a number of large dyeing establishments. Vast heaps of the shells have been discovered there, the remains of its former industry. With the decline of the Roman empire, the employment of this purple color ceased, and it was not until a Florentine of the name of Orschilini discovered the dyeing properties of the lichen now called orchella weed, that a simple purple color was known in Europe. The discovery was kept secret in Italy for nearly a century, and that country supplied the rest of Europe with the prepared dye, which received the name of orchil or archil (q. v.). The color was very fugitive, and soon ceased to be used by itself; it, however, was found very useful in combination, and has a remarkable power of brightening up other colors. Many improvements have been lately made in archil dyeing, especially in fixing it. Its value, however, has been greatly lessened by the discovery of the beautiful series of purples yielded by coal-tar as results of the combination of one of its products called aniline with other bodies. See DYEING.

PURPLE EMPEROR, *Apatura iris* or *Nymphalis iris*, one of the largest of British butterflies, and one of the most richly colored. The expanse of wings is from $2\frac{1}{2}$ to $3\frac{1}{2}$ inches. The wings are strong and thick, and the flight more sustained than that of many butterflies. The purple emperor is very often to be seen about the tops of oak-trees.

PURPLES. See EAR-CKOCKLES.

PURPLE WOOD, or **PURPLE HEART**, the heart-wood of *Copaifera pubiflora* and *C. bracteata*, a very handsome wood of a rich plum color. The trees producing it are natives of British Guiana, where the wood is called generally *maricaoayana*. The trees are rather rare on the coast, but in the upland forests are common. The chief interest of the wood is its remarkable adaptation to the purposes of artillery and fire-arms. It is said no wood is better adapted for mortar-beds and gun-carriages, as it sustains better than any other the violent concussions to which they are subjected. Its chief use in this country has been for making ramrods for muskets. Its great beauty and smooth grain would insure its extensive employment in cabinet-work in this country, if it were better known.

PURPURA, a genus of gasteropodous mollusks, of the family *buccinidae*. The species are very similar to those of the genus *buccinum* (see WHELK), but have a less elongated shell, and a flattened columella, which is pointed at the base, and forms there, with the outer lip, a canal excavated as a notch in the shell, and not projecting. The species are numerous, mostly natives of the shores of warm climates. *P. lapillus* is a species pretty common on most parts of the British coast. It is smooth and whitish, with bands of reddish-brown, and sometimes 2 in. long. It feeds on mussels and other mollusks, boring their shells with its proboscis. The genus is interesting, because some species of it were amongst those which yielded the famous *Tyrian purple* of the ancients. *P. patula* is supposed to have been one of those from which this dye was obtained, but it may have been obtained from others, as *P. lapillus*. The dye is contained in a small vein-like sac near the head. See PURPLE COLORS.

PURPURA, or **THE PURPLES**, is a malady which is often erroneously placed among the diseases of the skin. It is in reality a blood disease, and is characterized by the appearance of small round spots, of a deep purple color, which are seen first and most abundantly on the legs, and afterward extend to the arms and trunk. They are accompanied by no local pain, are not effaced by pressure (being due to a drop of blood extravasated beneath the cuticle, or in the structure of the skin itself), do not rise above the surrounding surface, and are sometimes intermixed with livid patches resembling bruises; and, before disappearing, both the round spots and the patches undergo the same change of color which a bruise undergoes. These spots are not peculiar to the skin, but occa-

sionally occur upon internal surfaces, and in the tissues of viscera. Passive hemorrhages from the mucous membranes frequently accompany the external symptoms. There is usually much debility, and often a great tendency to faintness. The duration of the disease varies from a few days to a year or more. Slight cases are devoid of danger, and even the hemorrhagic cases usually recover, unless the bleeding has been excessive, or the blood has been extravasated into a vital organ.

The causes of this disease are obscure. The mode of treatment varies in different cases, but the main indication always is to correct the condition of the blood. When there is reason to believe that the disease is dependent upon depressing influences, a nutritious diet, tonics, and stimulants are required; and chalybeates, or the mineral acids, and quinine, with plenty of exercise in the open air, should be prescribed. When, however, there is no evidence of the operation of any debilitating cause, and the pulse is hard, the most efficient treatment consists in abstinence, venesection, and purgatives. In cases of a mixed nature, a mixture of the oil of turpentine and castor-oil, in free doses (2 drams of the former to 5 or 6 drams of the latter), and iced drinks, or the sucking of small pieces of ice, have been strongly recommended. If the hemorrhage is not stopped by the oil of turpentine, gallic acid, or acetate of lead and opium, must be prescribed; and if it proceeds from accessible parts, local measures, such as the employment of ice or strong astringents, should also be employed.

PURPURE, in heraldry, the color purple, expressed in engravings by lines in bent sinister. It is of infrequent occurrence in British heraldry.

PURPURINE ($C_{14}H_5O_5 = C_{14}H_5(OH)_2O_2$); discovered by Robiquet and Colin in 1828; named also *madder-purple*, *oryzalzarine*, and *trioxanthraquinone*. Produced from a vegetable source, madder, and existing therein as a glucoside, it requires for its extraction as a separate dye the operation of mineral chemicals; it is included, in its glucoside form, in the *rubian* of Schunck, an amorphous mixture of glucosides (see **RUBIAN** and **ALIZARINE**); but it is distinctly separate from the crystalline ruberythric acid of Rothleder, which is the alizarine glucoside. It is found also in combination with munjistine, in munject. The purpurine glucoside itself has not yet been isolated, being very unstable. As a dye-stuff and in calico-printing, purpurine, with alumina mordants, yields bright reds; with iron, a grayish violet. Resisting cleaning with soap and nitromuriate of tin fairly well, they are yet not so permanent against washing and light as alizarine colors. When using madder, garauine, etc., on calicoes, some dyers consider the purpurine nearly useless, but others contend for its necessity to particular shades of pink and red. Robiquet and Schunck assert that the finest madder colors are due to alizarine: this is supported by Kopp, who decides the basis of Turkey-red, an important dye, to be alizarine; stating that purpurine, while dyeing mordanted cloth perfectly, is unstable compared with alizarine, and does not so readily "take" on oiled cloth.

Optical Properties.—According to Stokes, the spectroscope determines the existence of purpurine, from the two dark bands in the green, in its solution in alkaline carbonates; as also those in ether and alum. the last being delicately fluorescent. The carbonate of soda solution secures enough purpurine from a square inch of dyed cloth to exhibit its reaction. Alizarine yields different spectroscopic absorption bands, and also is known from purpurine by forming violet solutions with alkalis and alkaline carbonates, the solutions remaining unchanged in air; while purpurine would be destroyed by oxidation. **Properties.**—Purpurine, slightly soluble in boiling water, giving a rose-color solution, dissolves in alum, not separating even from a concentrated solution, and presents a beautiful fluorescence, and appears as a red, feathery, crystalline powder by sublimation, and deposits in orange-red needles from boiling alcohol. In sulphuric acid of 400° Fahr. temperature it is unchanged, and precipitates from its solution if thrown into water. In nitric acid, if boiled, it changes to phthalic and oxalic acid. Other solvents are ether, benzol, glycerine, acetic acid, and ammonia, in which it forms *purpuramide* or purpurine ($C_{14}H_5NH_2(OH)_2O_2$) on standing or on the application of heat; precipitating then in deep violet flocks on the addition of an acid. In alkaline hydrates and carbonate its solutions are cherry or poppy red, and acids reprecipitate it in orange yellow flocks; and in alkaline hydrates it oxidizes and disappears on standing in air, so decolorizing the solution. A mixture of purpurine and caustic soda solution with some ether yields sodic purpurate in crystals. Its basic, calcic, and aluminic lakes are soluble in boiling carbonate of soda solution. Heated with zinc dust, it forms anthracene ($C_{14}H_{10}$). Boley claims to have changed it to alizarine by a heat of 410° Fahr. applied to tubes containing it. Martin of Avignon claims that it and its chief compounds are convertible into alizarine by adding zinc dust to a sulphuric acid solution, and precipitating in water. (See Calvert's *Dyeing and Calico Printing*, Lond. 1876, p. 38.) Rosenstiehl, with various reducing agents, got only purpuro-xanthin, not alizarine. **Preparation.**—Identical in its extraction from madder, with alizarine purpurine more easily dissolves in solution of alum, and is thus extracted. Several methods of preparation are known. Kopp's, worked commercially at Strasburg, extracts the madder with aqueous sulphuric acid, and decomposes the glucoside of purpurine; precipitating the dye free from alizarine, by adding 3 to 5 per cent of sulphuric acid and heating to 86° to 104° Fahr.; leaving unaltered the ruberythric acid, only changeable by a higher temperature. Schützenberger and Schiffert found in crude purpurine about 75 per cent pseudo, 12½

purpurine, $12\frac{1}{2}$ orange matter, and one-fifth of one per cent purpuro-xanthin; Schunck claims these to be mixtures of separate bodies, especially the orange; considered a close resemblance to rubiacine. Rosenstiehl confirms this. F. de Lalande changes alizarine to purpurine by treatment in sulphuric and arsenic acid or manganese dioxide; purifies its precipitate in water, with alum; claiming to have so proved, that its single atomic difference of oxygen from alizarine does not come from a hydroxyl group; therefore, that purpurine is oxalazarine. The attempted artificial formation of purpurine from alizarine sulphuric acid, by its fusion with potassic hydrate, is a failure. See **MADDER**, *ante*.

PURPURINE. PSEUDO ($C_{14} H_8 O_6 = C_{14} H_4 (OH)_4 O_2$), (for mode of production, see **PURPURINE**); first discovered by Schützenberger and Schiffert, from Kopp's purpurine, in which, as three-fourths, it constitutes the chief ingredient. Almost insoluble, in even boiling alcohol, it yields to hot benzol, and crystallizes from the solution in brick-red crystalline needles. A high temperature either in sublimation or in alcohol at $200^{\circ} C.$, in sealed tubes, produces purpurine, its original source (so pointing to a merely mechanical change?). According to Rosenstiehl, it yields to mordanted cotton, but only when in distilled water, shades of color approaching and so continuing the series of shades from alizarine. Prepared from madder alone, its source is vegetable; but in dye-house practice, it is found as a calcic lake in the refuse of the dye-beck.

PURPURO XANTHINE, ($C_{14} H_8 O_4$) from Kopp's purpurine, as one-fifth of one per cent; and first prepared by Schützenberger and Schiffert as a yellow body, isomeric with alizarine, and dyeing alumina mordanted cloths a dull evanescent yellow. It is readily soluble in alcohol and benzol, sublimes without decomposition. It is easily produced from purpurine or pseudo purpurine by their reduction in aqueous PI_3 , in a temperature of $180^{\circ} C.$; or by solution in sodic hydrate, adding stannous chloride till change of the previous red color to yellow; and precipitating by any acid.

PURSE. See **DUNLIN**.

PURSE-CRAB, *Birgus*, a genus of *crustacea*, of the order *decapoda*, and sub-order *anomura* (see **CRAB**), allied to hermit-crabs (q.v.), but having the abdomen or *tail* shorter and almost orbicular, its under surface soft and membranous, its upper surface covered with strong plates, which overlap one another as in lobsters. The first pair of legs have large and powerful pincers; the pair of legs nearest the abdomen are very small, but terminated by rudimentary pincers; the pair next to them larger, with small pincers; the second and third pair of legs are terminated by a single nail. A species of purse-crab (*B. latro*) is found in Mauritius and in the more eastern islands of the Indian ocean. It is one of the largest of crustaceans, sometimes two or three feet in length when fully stretched out, and capable of erecting itself to the height of a foot from the ground, which it readily does if irritated, retreating backward, and exhibiting to the utmost its powers of offense or defense. It is of a yellowish-brown color, its limbs covered with little blackish projections. It is never found far from the sea, to which it is said to pay visits, in order to moisten its gills; but it resides on land, and often in holes under the roots of trees, where it accumulates great quantities of the fibers of the cocoa-nut husk, as if to keep itself warm, or for a soft bed. The Malays rob these stores to supply themselves with junk. The gills of the purse-crab are contained in a very large cavity, of which they fill only a very small part. Its food consists of cocoa-nuts and other nuts, which it climbs trees to procure. Its manner of dealing with a cocoa-nut is described as exhibiting a remarkable instinct, as it always begins to tear off the husk at the end where the eyes are. It is variously stated that it makes a hole through the eye from which the nut would germinate, and then scoops out the nut with the small pincers of its fourth pair of legs; and that having made this hole, it seizes the nut by one of its great pincers, and breaks it against a stone. Both statements may perhaps be true.

PURSER, in the royal navy, was formerly a warrant, and subsequently a commissioned officer, in charge of the provision, clothing, pay, and necessaries of a ship-of-war. His title was changed in 1844 to that of paymaster (q.v.).

PURSLANE, *Portulaca*, a genus of plants of the natural order *portulacæ*, having a bifid calyx, 4 or 6 petals, 8 or 16 stamens, and a capsule dividing around the middle. **COMMON PURSLANE** (*P. oleracea*) grows in cultivated and waste grounds on the seashore, in almost all tropical and sub-tropical parts of the world. It is cultivated as a pot-herb. It is a short-lived annual, with spreading and rather procumbent stems, and obovate fleshy leaves, which, as well as the young shoots, are frequently used in salads. The young and tender shoots are pickled in France like gherkins. Purslane is not so common in British gardens as it once was.

PURSUIVANT (Fr. *poursuivant*, follower), the third and lowest order of heraldic officers. The office was instituted as a novitiate, or state of probation through which the offices of herald and king-at arms were ordinarily to be attained, though it has been held that a herald or king-at-arms may be made *per saltum*. There are four pursuivants belonging to the English college of arms: *Rouge croix*, the oldest, so named from the cross of St. George; *blue-mantle*, instituted either by Edward III. or Henry V., and named in allusion to the robes of the order of the garter, or perhaps to the color of the arms of France; *rouge dragon*, deriving his title from king Henry VII.'s dexter sup-

porter, a red dragon, assumed in allusion to his descent from Cadwaladyr; and *portcullis*, named from a badge of the same monarch. There are six pursuivants in the heraldic establishment of Scotland, known by the names of *Dingwall*, *Bute*, *Carrick*, *Ormond*, *Kintyre*, and *Unicorn*—titles which, as well as those of the heralds, seem to have originated in the reign of James III. The Scottish pursuivants take precedence according to seniority in office.

In ancient times, any great nobleman might institute his own pursuivant with his own hands and by his single authority. The dukes of Norfolk had a pursuivant, called *blanch-lyon*, from the white lion in their arms; the pursuivant of the dukes of Northumberland was styled *espérance*, from the Percy motto; and Richard Nevil, earl of Salisbury, had a pursuivant called *eagle vert*. We even find sir John Lisle in 1442 making Thomas de Launey his pursuivant, by the title of *blanch sanglier*. The ancient costume of a pursuivant of the king was a surcoat, embroidered with the royal arms, and worn with one sleeve hanging down in front, and another behind. In 1576 rouge croix was severely censured for wearing his coat as a herald. In later times, however, a pursuivant's coat is worn exactly as a herald's, the latter officer being distinguished by the collar of SS.

PURŪRAVAS, a celebrated legendary king of ancient India. According to tradition, he was a son of the planet Budha, or Mercur, by Hā—a name of the earth, a prince renowned for liberality, devotion, magnificence, truthfulness, and personal beauty; but still more so on account of his love for the Apsaras Urvasī. This heavenly nymph having incurred the imprecation of some gods, and therefore having been compelled to descend from heaven, saw Purūravas, and was seen by him. The king having, in consequence, fallen in love with Urvasī, she consented to return his affection, on the condition that he would never suffer two rams, which she loved as children and always kept near her bedside, to be carried away from her, and also that he should never be seen by her undressed. To these terms the king gave his assent; but the Gandharvas, the choristers in Indra's heaven, and the husbands of the Apsaras being jealous of Purūravas, instigated one of their tribe to carry away one of the rams during the night; and after he had accomplished their design, other Gandharvas came and stole the second ram. Upon this Purūravas highly incensed, and trusting that the nymph would not see his person as it was dark, rose in pursuit of the robbers. At that moment, however, the Gandharvas caused a flash of lightning to irradiate the scene, and Urvasī beheld the king undressed. The compact was violated, and Urvasī disappeared, while the Gandharvas abandoning the rams, departed to the sky. Purūravas recovered the animals, but could find Urvasī nowhere. Like one insane, the king now wandered over the world until he saw her at Kurukshetra, sporting with four other nymphs of heaven in a lake beautified with lotuses. Urvasī, however, told him to keep away from her until, at the end of the year, she should be delivered of the son with whom she was pregnant by him. He obeyed; and after Ayus was born, these annual interviews between Purūravas and Urvasī were repeated, until she had born him five other sons—Dhīmat, Amāvasu, Visvāvasu, S'atāyus, and S'rutāyus. But the king, now longing for an uninterrupted reunion with his wife, Urvasī endeavored to propitiate the Gandharvas who had caused their separation. Her efforts were successful; and they taught the king how to produce by attrition from the wood of the fig-tree, a sacrificial fire, and how to divide it into the three fires required for sacrificial acts. By this means they enabled him then to celebrate many sacrifices, and, by virtue of these, to be transferred to the sphere where Gandharvas and Apsaras dwell together. This legend is adverted to in the Vedas, and related with more or less detail in the *Mahābhārata* and the *Purānās* (see, for instance, Wilson's *Vishnu u-Purānā*); it is likewise the subject of the celebrated drama of Kālidāsa, the *Vikramorvasī*, where, however, the incidents that, according to the *Purānās*, cause the separation of Purūravas and Urvasī, are not mentioned by the poet, her disappearance being ascribed by him to a fit of jealousy, in which she trespassed on the proscribed bounds of a divine hermitage. It deserves notice, too, that in the drama, Urvasī is transformed into a creeper, and discovered in that condition by Purūravas, when frantically roaming in search of her in the forest of Akalusha—a transformation pointing to some affinity between this latter myth and that of Daphne when pursued by Apollo.—The idea, however, on which the original Hindu myth is based—apart from the semi-historical and fantastical detail by which it was overgrown—seems to have been suggested by the (supposed) motion or wanderings (Purūravas, from *puru*, much, and *ravas*, going—from *ru*, go, move) of the sun (*Gandharva*, in the Vedas, also, being a personification of the fire of the sun), attracting or absorbing, and thus uniting, as it were, with the vapors floating in the sky (*Apsaras*—from *ap*, water, and *saras*, going, arising, hence “water-born”—being originally “personifications of the vapors which are attracted by the sun, and form into mists or clouds;” see Goldstücker's *Sanskrit Dictionary*, under “Apsaras;” and Urvasī, from *uru*, large, wide, and *as*, pervade, hence “the far-pervading;”—being identified in one passage of the *Mahābhārata* with the river Ganges). A Greek myth of a kindred character is that of Apollo and Daphne, and also that of *Io*, according to the ingenious interpretation of it by prof. P. W. Forchhammer, in the *Verhandlungen der Versammlung deutscher Philologen in Frankfurt*, 1862. In his *Hellenica*, the same scholar has moreover shown that in Greek mythology the ram is a symbol of the cloud.

PURUS, a river rising in mountains e. of Cuzco, Peru, and flowing through Peru, Bolivia, and Brazil until it empties into the Amazon. It has in all five mouths, the two most distant being more than 100 m. apart. Its length is about 2,000 m., its general direction is n.e., and it is navigable for a considerable distance. The region through which it flows abounds in the tropical fauna and flora, and has as yet been but partly explored.

PURVEYORS, ARMY, were officers charged with superintending the civil affairs of army hospitals, as the payment of men, procuring provisions, medical comforts, bedding, etc. The purveyor acted independently of the medical officer, and was responsible through the purveyor-in-chief to the secretary of state for war. The department consisted of a purveyor-in-chief, principal purveyors, purveyors, deputy-purveyors, and clerks. The purveyor-in-chief ranked with a colonel in the army, and had a salary of £547 per annum, rising to £730 after long service. In 1868 the department was merged with others in the control department; and on the abolition of the latter in 1875 its functions passed to the commissariat and transport department.

PUS is a well-known product of inflammation, and occurs as a thick yellow creamy fluid, differing from all other morbid exudations in containing a large number of corpuscles, having a soft and fatty feeling when rubbed between the fingers, a peculiar odor, usually an alkaline reaction, and a specific gravity of about 1.032. Like the blood, it consists of certain definite microscopic elements, and of an intercellular fluid or serum in which they swim.

The microscopic elements are: 1. The pus-corpuscles, which, both in their microscopical and chemical relations, seem to be identical with the lymph-corpuscles, or colorless blood-cells; in diameter, they range from 0.004 to 0.005 of a line, and each corpuscle consists of a cell-wall, which often appears granular, of viscid transparent contents, and of a nucleus which is adherent to the cell-wall, and which can be rendered much more apparent by the addition of acetic acid. 2. Molecular granules, and 3. Fat-globules. The serum of pus is perfectly clear, of a slightly yellow color, and coagulates on heating into a thick white mass.

The chemical constituents of pus are water (varying from 769 to 907 in 1000 parts), albumen (from 44 to 180); fats (from 9 to 25); extractive matter (from 19 to 29); and inorganic salts (from 6 to 13); in addition to which, mucin, pyin, glycin, urea, etc., are occasionally present. Of the inorganic or mineral constituents, the soluble salts are to the insoluble in the ratio of 8 to 1, and the chloride of sodium (the chief of the soluble salts) is three times as abundant as in the serum of the blood. The mode of formation of pus is described in the article SUPPURATION.

PUSEY, Rev. EDWARD BOUVERIE, D.D., regius professor of Hebrew at Oxford, and canon of Christ-church, a celebrated English divine, and one of the chief promoters of the High church movement in the church of England. He is the second son of the honorable Philip Bouverie (younger brother of the first earl of Radnor, who assumed the name of Pusey), by lady Lucy Sherard, eldest daughter of Robert, fourth earl of Harborough. He was born in the year 1800, was educated at Eton, and thence proceeded to Christ-church, where he obtained a first class in classics in 1822, and gained the university prize for a Latin essay in 1824. He was afterwards elected fellow of Oriel; and in 1828 succeeded Dr. Nicoll in the regius professorship of Hebrew, to which a canonry at Christ-church is annexed.

Dr. Pusey's first publication was on the *State of Religion in Germany*, the result of a visit to that country, which appears to have greatly influenced his subsequent course, and led him to devote himself to resist the progress of rationalism. In 1835 he became a contributor to the *Tracts for the Times* (in union with Messrs. J. H. Newman, Keble, Williams, etc.), of which Nos. 67, 69, *On Holy Baptism*, and Nos. 18 and 66, *On the Benefit of Fasting*, were written by him (see TRACTARIANISM). He was also one of the editors of the *Library of the Fathers*, and of the *Library of Anglo-Catholic Theology*. In consequence of a sermon on *The Holy Eucharist, a Comfort to the Penitent*, preached before the university in 1843, he was suspended from preaching by the vice-chancellor for three years, on the allegation that his language on the subject of the real presence was beyond what is sanctioned by the formularies of the church of England. Dr. Pusey, however, protested against the proceeding, and appealed to the teaching of English divines. His other principal works are—*Remarks on the Benefits of Cathedral Institutions*; two treatises on the *Royal Supremacy in Spiritual Matters*; a treatise on the *Ancient Doctrine of the Real Presence*; *Letters to the Archbishop of Canterbury, the (late) Bishop of Oxford, and the (late) Bishop of London, in Defense of Church Principles*; *On Marriage with a Deceased Wife's Sister*; *On the Use of Private Confession in the English Church*; translations of several foreign devotional works adapted to the use of the English church; *History of the Councils of the Church*; a *Commentary on the Minor Prophets*; *Lectures on the Prophet Daniel*; a *Catalogue of Arabic MSS. in the Bodleian Library*; and numerous sermons.

PUSHKIN, ALEXANDER SERGEIVITCH, a Russian poet of good family, was born at Moscow, May 26, 1799, and educated at the imperial lyceum of Tsarskoe Selo, where he acquired more reputation for his liberal opinions than for his attention to study. In 1817 he entered the service of government, and soon became one of the most prominent

figures in fashionable society. In 1820 he published his romantic poem of *Ruslan and Lyudmila*, which met with a flattering reception from the public. The incidents are laid in the legendary times of Vladimir, the Russian Charlemagne. During the next five years Pushkin led a roving sort of life, in the course of which appeared his *Plennik Kavkaskoi* (Prisoner of the Caucasus, 1822), which narrates the escape of a young Russian from a Circassian horde by the help of a Circassian maid; and his *Fountain of Bakhchiserai* (1824), a poem of singular beauty and interest. These were followed by *Teigani* (The Gipsies, 1827), a picture of wild gipsy life in Bessarabia, and *Egerii Onaegin* (1828), a humorously sarcastic description of Russian society—after the fashion of Byron's *Beppo*. In 1829 he published his last narrative poem, *Poltava*, which has for its hero Mazeppa, the famous Hetman of the Cossacks. About the same time, he wrote a dramatic poem entitled *Boris Godunov*, one of the best of all his works; but subsequent to this he appears to have addicted himself almost wholly to prose. Another, and less commendable change, however, took place in him. From being or seeming an enthusiastic "liberal," he passed—after his appointment to the office of imperial historiographer, with a pension of 6,000 rubles—to the extreme of Russian conservatism. The chief thing he did in his official capacity was to write the life of the rebel Pugatschew. He was mortally wounded in a duel, and expired at St. Petersburg, Jan. 29 (Feb. 10), 1837. Pushkin is reckoned the finest poet that Russia has produced in the present century. His countrymen call him the "Russian Byron," and he has not a little of the bold and brilliant genius of his prototype, excelling like him in vigor of imagery and impassioned sentiment.

PUSTULAR DISEASES. Under this head are included the cutaneous diseases which are characterized by *pustules*, or circumscribed elevations of the cuticle, containing pus; they are ecthyma, impetigo, acne, and sycosis, all of which are noticed in special articles. Pustules also occur in small-pox, and occasionally in chicken-pox, but these are on good grounds regarded as febrile diseases, in which the eruption on the skin is not the primary disorder. Boils (q.v.), although not included under the head of "pustular diseases," are in their nature pustular.

PUSTULE, MALIGNANT. See MALIGNANT PUSTULE, *ante*.

PUTCHUK, an aromatic root, a considerable article of commerce in India, where it is used both as a perfume and as a medicine, and of export to China, where it is much used for incense, as it gives out a very pleasant odor when burned. It appears to be the *costus* (q.v.) of the ancients, and is the root of *Aucklandia costus*, one of the *compositae*, and not, as was once supposed, of a species of *costus*, one of the *scutamineae*. It grows in Cashmere, and is called *kooth* in Northern India. Putchuk is its name at Calcutta.

PUTEAUX, a t. of France, in the dep. of Seine, at a distance of about two m. from the western boundary of Paris. It is situated on the left bank of the Seine, opposite to the Bois de Boulogne. The situation of Puteaux is a very pleasant one, and many Parisians have fine villas here. The population and industrial activity of the place have of late greatly increased. Pop. '76, 11,387.

PUTEOLI. See POZZUOLI, *ante*.

PUTIGLANO, a t. in the province of Bari di Puglia, Italy; pop. about 10,000. Besides agriculture, the chief industry is the manufacture of cotton and woolen cloths, and nails.

PUT-IN-BAY ISLANDS, at the w. end of lake Erie, is a group of ten islands, viz., Put-in-Bay, formerly known as South Bass and Bass isle, Middle Bass *alias* Floral isle, North Bass *alias* isle of St. George, Rattlesnake, Sugar, Green *alias* Strontian, Glacial *alias* Starve island, Ballast, Buckeye, and Gibraltar. The group constitutes Put-in-Bay township of Ottawa county, Ohio. Put-in-Bay island proper is the largest of the group, and contains about 2,000 acres. The surface rises from 10 to 80 ft. above the lake, and, like all the islands in the w. end of lake Erie, has but a thin deposit of soil overlying limestone rock, which forms their low but picturesque shores. A beautiful bay on the n. of the island gives its name and fame to the island: for here the gallant young Oliver Perry, commander of the little fleet of the United States on lake Erie in the last war with Great Britain, was waiting for the British fleet in Sept., 1813, and on the 10th sallied out to give it battle. The engagement was brilliant. After the young commander's own ship had been quickly and totally disabled by the enemy, he crossed in an open boat to another, and within two hours after the battle began the British fleet surrendered, and Perry wrote that laconic dispatch to Gen. Harrison, "We have met the enemy and they are ours." (See PERRY, OLIVER HAZARD.) After the battle the remnant of the fleets returned to Put-in-Bay. Gibraltar is a small and picturesque rocky island lying at the mouth of the bay. Here the Perry monument has been built to commemorate the victory and its heroes; and Jay Cooke, who owns the island, has a picturesque summer residence. On the main island a park was reserved on the inner shore of the bay, and large summer hotels were erected between 1850 and 1860. Until the destruction of the largest by fire in 1878 it was a favorite resort for summer travelers, especially from the south. The clear and shallow water of the bay and the lake, the loveliness of the scenery among the verdant islands, the facilities for all kinds of boating, excellent fishing,

convenient bathing beaches, and easy connections by steamers with the cities of the lakes, combine to make this group attractive among watering-places. Grape-growing and wine-making are the principal industries. The climate and soil of these islands, it is now conceded, make their vineyard products superior to any other in the United States on the Atlantic slope. The Catawba is the principal variety of grape cultivated, but there are considerable vineyards of Delaware, Concord, Norton's Virginia, and Ives' seedling. A cave of considerable dimensions is one of the curiosities of the island.

Middle Bass island is the second in size of the group, about two m. n.w. from the former. On its w. end a company of citizens of Toledo have secured a grove of the virgin forest and erected a large number of small summer cottages, a central eating hall, and a dock, forming the prettiest residence group of the islands. Near it are extensive vineyards, and a large music and pleasure hall. On the s. side of the island facing Put-in-bay are the extensive wine-vaults of Werle Werke & Co. of Cincinnati, and over them a large promenade and refreshment hall, built to meet the wants of summer travelers. This wine-house sells yearly 500,000 gallons of island wines. A steamer plies every half hour between the hotels of Put-in-Bay and this pleasure house.

Rattlesnake, Sugar, Green, and Starve islands are small and unimportant outliers of the islands just described. Glacial island is named from the unusually well-marked lines of glacial action that are found upon it, but which are found in places on all the islands. Ballast island is the site of the "Cleveland colony"—the summer cottages of a company of Cleveland people.

North Bass, *alias* Isle of St. George, is the most westerly of the group. It contains about 1000 acres, and rises by smooth slopes from the lake to an elevation of 80 feet. On its w. end is one of the best light-houses on the lake. Excellent vineyards cover most of its surface.

PUTLOGS, small timbers used in the construction of buildings. They lie between the wall and the poles of the scaffolding, and on them the floor of the scaffolding rests. Apertures called "putlog-holes" are common in buildings of all ages.

PUTNAM, a co. in n.e. Florida, drained by the St. Johns river, which bounds it on the e.; 630 sq.m.; pop. '80, 5,746—5,270 of American birth, 2,219 colored. The surface is level and sandy, mostly covered by pine forests. There are many small lakes and swamps. Cotton, sugar-cane, grass, and cattle are the staples. Co. seat, Palatka.

PUTNAM, a co. in n. central Georgia, bounded on the e. by the Oconee river, drained by Little river, traversed by a branch of the Central railroad of Georgia; about 400 sq.m.; pop. '80, 14,539—14,512 of American birth, 11,027 colored. The surface is rolling or hilly and heavily wooded. The soil is fairly fertile. The principal productions are corn, cotton, and wheat. Co. seat, Eatonton.

PUTNAM, a co. in n. central Illinois, drained by the Illinois river; traversed by the Peoria branch of the Chicago, Rock Island and Pacific railroad; about 150 sq.m.; pop. '80, 5,555—4,702 of American birth. The surface is mostly level. Deposits of coal are found. The soil is fertile. The principal productions are corn, oats, wheat, barley, rye, and potatoes. Co. seat, Hennepin.

PUTNAM, a co. in w. central Indiana, drained by Eel river and its branches; traversed by the Indianapolis and St. Louis and other railroads; about 500 sq.m.; pop. '80, 22,502—21,916 of American birth, 570 colored. The surface is uneven, but the soil fertile; the products are corn, wheat, oats, hay, pork, and wool. Lumber and carriages are made. Limestone is found. Co. seat, Greencastle.

PUTNAM, a co. in n. Missouri, bordering on Iowa, drained by Locust creek and Chariton river, its e. boundary; traversed by the Burlington and Southwestern railroad; 500 sq.m.; pop. '80, 13,556—13,333 of American birth. Corn, tobacco, pork, wool, coal, and lumber are the staples. Co. seat, Unionville.

PUTNAM, a co. in s.e. New York, adjoining Connecticut; bounded on the w. by the Hudson river; drained also by Croton river and Peckskill creek; intersected by the Hudson River and New York and the Harlem railroads; about 220 sq.m.; pop. '80, 15,181—12,948 of American birth. The surface is hilly, and the scenery picturesque, including the highlands of the Hudson and lake Mahopac, a summer resort. Marble and iron are found. The soil is fertile, the principal productions are corn, oats, and hay. Co. seat, Carmel.

PUTNAM, a co. in n.w. Ohio, drained by the Ottawa, Blanchard, and Auglaize rivers, and intersected by the Dayton and Michigan railroad and the Miami canal; 500 sq.m.; pop. '80, 23,718—21,669 of American birth. The surface is nearly level, and heavily wooded. Corn, wool, grass, pork, and lumber are the chief products. Co. seat, Ottawa.

PUTNAM, a co. in central Tennessee on the n.w. slope of the Cumberland range; drained by branches of the Cumberland river; 480 sq.m.; pop. '80, 13,556—13,333 of American birth, 20 colored. The surface is hilly, and the soil only moderately fertile; tobacco, corn, wool, and pork are the staples. Coal is found. Co. seat, Cookville.

PUTNAM, a co. in n. West Virginia, drained by the Great Kanawha river, intersected by the Chesapeake and Ohio railroad; about 377 sq. m.; pop. '80, 11,376—11,189 of American birth, 356 colored. The surface is hilly and heavily timbered. The soil is fertile. The principal productions are corn, wheat, oats, and hay. Coal and iron are found. Co. seat, Winfield.

PUTNAM, a t. in Windham co., Conn., on the Quinnebaug river, the Norwich and Worcester and the New York and New England railroads; pop. '70, 4,192. It has churches, schools, newspapers, and banks. There are large cotton and woolen mills, etc.

PUTNAM, FREDERICK WARD, b. Mass., 1839; educated at the Lawrence scientific school. He was superintendent of the museum of the Essex institute, editor of the *Naturalist Directory*, director of the Peabody academy of science at Salem, 1867-75, when he was appointed curator of the Peabody museum of archaeology and ethnology connected with Harvard university. He edited the *American Naturalist*, 1867-75. In 1875 he was assistant in archaeology on the U. S. surveys w. of the 100th meridian.

PUTNAM, GEORGE PALMER, 1814-72; b. Maine; great-nephew of gen. Israel Putnam; settled in New York at an early age, where he established himself as a bookseller, being also long associated with John Wiley in the firm of Wiley & Putnam. He was one of the earliest publishers to recognize the growing value of American works; and besides issuing the works of Washington Irving, J. Fenimore Cooper, Bayard Taylor, and other prominent authors, was instrumental in introducing many young writers who have since become eminent. In 1853 he founded *Putnam's Monthly*, a periodical formed on a plan more elevated than was then common in American magazine literature, and of which George William Curtis was the editor. It was not financially successful, and was dropped in 1857, though revived for two years, 1868-70. Mr. Putnam also published the official illustrated catalogue of the New York crystal palace industrial exhibition of 1853. He was a laborious compiler of statistical works, including *Chronology*, 1833; *American Facts*, 1845; *The World's Progress, a Dictionary of Dates*, 1850; etc. After his death his business was continued by his sons, under the firm name of George P. Putnam's Sons, who still rank among the leading publishing houses in the United States.

PUTNAM, ISRAEL, 1718-90; b. Mass.; had a limited education, but in his youth was noted for physical strength and courage. In 1739, removing to Pomfret, Conn., he became a farmer and wool-grower. The farmers having long suffered greatly from the depredations of a she-wolf and her whelps, and made fruitless efforts to drive her out of her den by burning brushwood, straw, and sulphur, Putnam entered the cavern by a narrow opening at midnight with a torch in one hand and musket in the other, and shot her as she was on the point of springing upon him. The next 12 years he spent on his farm. In the French war in 1755 he commanded a company of troops at Crown Point; in 1757 received from the legislature the commission of major; saved during this year the powder-magazine of fort Edward at the burning of the barracks; in 1758, his corps being surprised by a party of French and Indians, he was captured, tied to a tree, and for an hour exposed to the fire of friend and foe, but escaped unhurt. The enemy being forced to retire, carried their captive with them, and at night the fire was kindled to burn him alive. He was tied to a tree, and the fire was already blazing, when he was rescued by the interposition of Molang, the French officer. He was taken to Ticonderoga, then to Montreal, where through the influence of col. Peter Schuyler, himself a prisoner, he was exchanged. In 1759 he was promoted to the rank of lieutenant. From that year to 1773 he was engaged either in various expeditions or on his farm. In April, 1775, tidings of the battle of Lexington reaching him while plowing; he left his plow in the field, turned his oxen loose, and mounting his horse rode to Cambridge in one day, a distance of 68 miles. Returning he was made brig. gen. by the legislature, of which he was a member, organized and drilled a regiment, and in a week was on his way back with his men to Cambridge. On his arrival offers of money and a commission as maj. gen. in the royal army were made him by the British officers, which he spurned. In May of that year he led a battalion of 300 men to Noddle's island, burnt a British schooner, captured a sloop, killed and wounded many of the enemy. By his advice it was decided to fortify Bunker hill. At that battle he displayed great energy and bravery. On the arrival of Washington at the camp to take command in July, 1775, he brought commissions from congress for four maj. generals, one of whom was Putnam. On the evacuation of Boston he was placed in command of New York, took part in the battle of Long Island, and on the evacuation of New York was sent to Philadelphia to fortify that city; was afterwards stationed at Crosswick and Princeton; in 1777 was ordered to take command in the Highlands of New York. In the summer of that year he was removed from his command in the Highlands on account of the surprise and loss of forts Montgomery and Clinton, though acquitted of blame by a court of inquiry, and restored to his command. He selected West Point as the site for a fortification. In 1779, when stationed in Connecticut, Horseneck, one of his outposts, guarded by 150 men and 2 cannon, was attacked by Tryon with 1500 men. Putnam, being closely pursued while on his way with his men to a swamp, dashed down a steep hill and escaped, receiving a ball through his hat. Riding to Stamford and collecting the militia, he formed a junction with his troops, pursued Tryon in his retreat, and took 50 prisoners. In the summer of 1779 he

had command of the troops in the Highlands, and completed the fortifications at West Point. The army going into winter-quarters he returned home, and on setting out again for camp, was stricken with paralysis. The inscription on his tombstone is, "He dared to lead where any dared to follow."

PUTNAM, MARY (LOWELL), b. Boston, 1810; daughter of rev. Charles Lowell; married in 1832 to Samuel R. Putnam, a Boston merchant. She had inherited a remarkable facility for the acquisition of languages, and from 1851 to 1857 resided in France and Germany, where she perfected herself in this direction, and prepared a history of Hungary. She translated Miss Bremer's *The Neighbors*, from the Swedish; and published anonymously *Records of an Obscure Man*; *Tragedy of Errors*; and *Tragedy of Success*; besides numerous dramatic poems on slavery and other topics of general popular interest. She has been a frequent contributor to the *North American Review* and the *Christian Examiner*.

PUTMAN, RUFUS, 1738-1824; b. Mass.; was a millwright; enlisted as a private soldier in 1757 in the French war, and in 1760 was made ensign. The succeeding 10 or 12 years he spent in farming and erecting mills, improving his leisure in study, especially of mathematics and surveying; went in 1773 on an exploring expedition to w. Florida, of which he was made deputy surveyor; in 1775 entered the continental army as lieutenant, and in 1776 was appointed by congress engineer with the rank of col.; in 1778 aided his cousin Israel in completing the fortifications at West Point; in 1783 was made brig. gen.; was a member of the Massachusetts legislature and aid to gov. Lincoln during Shay's rebellion. In 1786 he organized a company composed of the officers and soldiers of the war to form a settlement in Ohio. He was one of three directors appointed by the company to apply to congress for the purchase of lands, and 1,500,000 acres were obtained at 66 $\frac{2}{3}$ cts. per acre. The tract at the junction of the Ohio and Muskingum rivers was selected, and April 7, 1788, Putnam laid out the city of Marietta, the first permanent settlement in Ohio. Sept. 9, 1788, he presided over the first court of general quarter sessions; Mar. 21, 1790, was made judge for the U. S. territory n.w. of the Ohio; in 1792 was appointed brig. gen., and accompanied gen. Wayne's army to Detroit against the Indians, and afterward as the U. S. commissioner made a treaty with several tribes; 1796-83 was surveyor-general of U. S. lands; in May, 1797, was made brig. gen. in the U. S. army; in 1803 was a member of the state constitutional convention.

PUTREFACTION is the term applied to the spontaneous decomposition of organic substances, when such decomposition is accompanied by an offensive odor. In other respects it may be regarded as identical with fermentation (q.v.). In the process of putrefaction, organic compounds of a higher order are resolved into lower organic compounds, into inorganic compounds (such as water, ammonia, sulphureted hydrogen, etc.), or into simple chemical elements such as hydrogen or nitrogen. The substances which most readily putrefy are the protein bodies (albumen, fibrine, caseine, etc.), and gelatinous tissues, glue, etc.; the only necessary conditions being the presence of moisture and the access of air at the commencement of the process. Since animals are mainly composed of the protein bodies, they are especially liable to undergo this change; but many vegetable products, which are rich in these bodies (e.g., seeds), are also prone to this form of decomposition. The peculiar smell is readily accounted for when the nature of the resulting compounds is considered.

The putrefaction of organic matters is prevented by a variety of conditions, amongst which may be mentioned (1) exclusion of air, (2) perfect dryness, (3) a freezing temperature (as, e.g., in the case of the mammoths preserved in the Siberian ice), (4) a high temperature (about 250°), and (5) antiputrescent or antiseptic substances of various kinds. It is worthy of notice that all bodies susceptible of putrefactive decomposition may act as ferments, and may thus induce special changes in sugar, urea, etc., which would not have occurred except in the presence of the putrefying matter.

PUTRID FEVER. See JAIL FEVER.

PUTTING TO SILENCE, in the law of Scotland, is the title of a suit or action of declarator, the object of which is to put an end to certain pretended claims of marriage. The most recent illustration of this action was that in *Yelverton v. Yelverton*. The suit corresponds to what is called in England a suit of jactitation (q.v.).

PUTTUN, PATTAN, OF ANHULWAR PATTAN, a t. in India, in the territory of Guicowar, Guzerat, 64 m. n.w. from Allahabad. It stands on the Saraswati, a small river, which is a tributary of the Banas; and is a town of considerable importance, having manufactures of swords, spears, pottery of a light fine kind, and silk and cotton goods. Puttun occupies part of the site of the ancient city of Anhulwara, the traces of the walls of which may still be seen, extending to about 5 m. in circuit. Pop. estimated at 30,000.

PUTTY, a composition of *whiting* and *drying* oil worked into a thick paste. It is used by painters and glaziers—by the former for filling up holes in surfaces, previous to their being painted with oil-colors; and by the latter, for fixing panes of glass in windows, etc. It becomes remarkably hard in time, and fixes the glass immovably. This has been found rather an evil in some cases, especially where thick plate-glass is used for skylights and other roofing purposes, because it will not permit the expansion and con-

traction caused by the varying temperature to which the glass is exposed in such situations. Hence the addition, in such cases, has been made lately of a pound of fine Russian tallow to every 12 lbs. of the ordinary putty materials. This prevents its becoming extremely hard, and insures a certain amount of elasticity.

PUTTY-POWDER, a material, consisting of peroxide of tin, in great use for polishing stone and metal work. It is also used as a coloring material for white glass, and for the white enamels of porcelain, etc. It is made by melting tin; as the surface oxidizes, the scum, which is the peroxide, is raked off, and when cold, is reduced to a fine powder, which is white in color, and the particles are extremely hard.

PUY is the name commonly given in the highlands of Auvergne and the Cevennes to the truncated conical peaks of extinct volcanoes. It is perhaps connected with *puit* or *puits*, a "well" or "vent," and may have been given in allusion to the craters of these mountains.

PUY, LE, or LE PUY-EN-VELAY, a t. of France, department of Haute-Loire, about 70 m. s.w. of Lyon, is one of the most picturesque towns in Europe. It stands on the steep southern slopes of mount Anis, from the summit of which starts up precipitously the huge basaltic mass called *Rocher de Corneille*, crowned by the ruins of an ancient episcopal castle. The greatest natural curiosity is the *Rocher de St. Michel*, an obelisk of nature's own making, composed of basaltic tufa, and rising in a solitary abrupt cone from the margin of the river Borne to a height of 265 ft., with a circumference at its base of 500 ft., and at its top, of from 45 to 50 feet. The sides of this "sugar-loaf" are almost perpendicular; but a winding stair cut along the rock conducts to the summit, which is surmounted by a little Romanesque chapel of the 10th century. The most notable buildings of Le Puy are the cathedral, a splendid but heavy-looking structure of the 10th or 11th c., situated in the highest part of the town, and chiefly remarkable for a wonder-working image of the Virgin (*Notre Dame du Puy*). For more than 100 years the town has furnished the carriers and mulcteers of southern France with the bells for their horses and mules. Lace is manufactured. Pop. '72, 16,000.

PUY-DE-DOME, a large central department of France, containing an area of 3,070 sq. m., and a population (1872) of 566,463. Plateau and mountain occupy three-fourths of it; plain and valley the rest. Branches of the Cevennes and of the Auvergne mountains overspread the e. and w. of the department. The multitude of conical hills or puys, of basaltic and lava masses, and of craters, shows the volcanic nature of the soil. See AUVERGNE. The principal river is the Allier (a tributary of the Loire), which flows in a northern direction through the middle of the department; but there are numerous lesser streams. The soil is, in general, light and poor; but its volcanic character fosters vegetation; and the splendid valley of Limagne, upward of 70 m. long, is fertile through out, and well cultivated. The climate is uncertain; the mountains are tormented with howling storms, and more or less covered with snow for six or seven months of the year. The chief products are wheat, rye, flax, fruits (especially cherries and nuts). Some middling wine is also produced. The high pasture-lands support great numbers of cattle, sheep, and goats. The principal minerals are iron, antimony, and lead. Hot and cold mineral springs are abundant; among the most frequented are those of St. Myon and Chateldon. The department is subdivided into the arrondissements of Ambert, Clermont, Issoire, Riom, and Thiers.

PUZZOLANA. See POZZOLANA, *ante*.

PUZZUOLI. See POZZUOLI, *ante*.

PYÆMIA (from the Gr. *pyon*, pus, and *hæma*, blood), or purulent infection of the blood, is a disease whose exciting cause is the introduction of decomposing animal matter into the circulation. The animal matter may be decomposing pus, unhealthy secretions, putrid fluid (as from decomposing hides, dead bodies, etc.), the fluid of glands, etc.; and it may be introduced through an ulcer or a wound, through an imperfectly closed vein (see PHLEBITIS and PTERPERAL FEVER), or through a mucous membrane, as that which lines the nostrils. The poison in these cases, if it acts at all, is rapidly absorbed and diffused, and the blood undergoes certain changes, the nature of which chemistry has as yet failed to detect. Within 24 hours, in very acute cases, there are severe shiverings, headache, and giddiness, followed by heat, perspiration, and accelerated circulation. In 24 hours more the patient may be in a hopeless condition, delirious, and rapidly sinking. In less acute cases the symptoms closely resemble those of typhoid fever, and in this form the disease is a common cause of death, after surgical operations. It is only, however, when there are *predisposing causes* that the poison acts so severely. By their presence they convert a comparatively slight local mischief into infection or the whole mass of the blood; while by their absence they render the poisonous matter comparatively harmless. Mr. Callender, whose essay on pyæmia is the most complete that has yet appeared (for the recognition of the disease by a special name is comparatively recent), signalizes as the chief predisposing causes—previous illness; extreme prostration or exhaustion of the system from organic disease, from surgical complaints, or from difficult parturition; unhealthy occupations; over-indulgence in food, etc.

In association with the general symptoms which have been already stated, there are often local or secondary complications.

The disease is always accompanied with great danger. When secondary complications are present, the hope of recovery is very small. "Practical surgeons," observes Mr. Callender, "acknowledge that very little chance remains for the patient who, after an operation, is attacked with symptoms of this disease." The only disease with which this disorder can be confounded is typhoid fever.

If the poison has been received into the system by an open sore, nitrate of silver should be applied freely, after which the part should be treated with soothing fomentations or poultices. The bowels should be freely acted on by a sharp purgative (as 5 grains of calomel and a scruple of jalap). The action of the skin should be increased by diaphoretics, and the bowels should be daily acted on by saline draughts, with the addition of bicarbonate of potash to stimulate the kidneys. By these means the poison may be eliminated. The depression of the nervous system, which is usually very marked, must be counteracted by opium in small and repeated doses, in addition to which, a dose of Dover's powder (10 grains) should be taken at bed-time. Stimulants, such as brandy and sherry, should be given in small but frequently-repeated doses from almost the beginning of the disease, and light nutritious food should be given as freely as the stomach will bear it. The internal administration of hyposulphite of soda and of the hyposulphites generally, has been lately recommended by prof. Polli of Milan.

Considering that pyæmia is the cause of death in 10 per cent of *all* cases of amputation, and in 43 per cent of *all fatal* primary amputations, it becomes a question of great importance how it can be prevented. Persons whose health is already broken down require careful preparation before undergoing an operation. "They must be strengthened," says Mr. Callender, "by tonics, such as quinine and iron; and their secretions must be set right by appropriate alteratives; this treatment must be continued for a considerable period; for if the health be much broken, it is slow of taking effect, and its employment for only a few days prior to an operation is of course simply useless. The diet should at the same time be attended to: and persons of intemperate habits should be accustomed to a more healthy mode of living, although in no case should the stimulants be too suddenly withdrawn." On the same principles, after the operation has been performed, these patients must have their strength supported by a nutritious diet; must have stimulants freely given them, if there are any signs of incipient prostration; and should take opium in sufficient doses to quiet the system and allay irritation.

PYAT, FÉLIX, b. France, 1810; was carefully educated, studied law, and was admitted to the bar as an advocate in 1831. He preferred a literary career, and against the counsel of his friends, became a newspaper writer--at first for the *Figaro* and *Charivari*, and afterward on the regular staff of the *Siècle*. He also wrote plays, some of which gained great popularity through their political references. Among his works of this class were *Mathilde*, *Diogène*, and *Le Chiffonier de Paris*. On the outbreak of the revolution in 1848 he threw himself at once into the struggle on the side of the people; attaching himself peculiarly to the fortunes of Ledru-Rollin, whom he afterward accompanied into exile. In this year he published *Le Droit du Travail*. After the return of the queen of England from her visit to Paris in 1855, he addressed to her *The Letter of the Jersey Erites to the Queen of England*, which attracted general attention. In 1861 he was tried for a political offense before the correctional police in Paris, and sentenced, *par contumace*, to fine and imprisonment. On the establishment of the republic of 1870 he returned to Paris, where he became a leader of the commune, and edited several revolutionary journals, including the *Combat* and *Vengeur*. In 1873 he was placed under condemnation to death, *par contumace*, on an indictment for inciting to civil war, participation in the insurrection of the commune, and complicity in the massacre of the hostages.

PYCNOGONIDÆ, a very remarkable family of *crustacea*, of the section *edentata* of Milne-Edwards, and forming the order *araneiformes* (spider-like) of some authors. By Cuvier and many other naturalists, a place was assigned them among *arachnida*; and it is only of late that they have been decidedly referred to *crustacea*, in consequence of the discovery that they undergo metamorphoses. They are all marine, and some of them live among algae, or are to be found under stones on the beach, whilst others are dredged from deep water. They seem to prey by suction on mollusks, but probably on many kinds of marine animals. The legs of many, as in the genus *pycnogonum*, are furnished with hooks for taking hold, and Linnaeus believed *P. littorale* to be parasitic on whales; but it is not uncommon among sea-weeds on the British coasts. The suctorial proboscis of these creatures may be said to form the whole head. The abdomen is almost rudimentary. Their most remarkable characteristic is in their digestive cavity. The stomach gives off from its circumference ten long cæca, four of which on each side extend into the proper or locomotive legs, the other two into the pincer-like rudimentary foot-jaws. These ramifications of the alimentary canal seem to serve all the purposes of the circulatory, respiratory, and chyloferous systems of higher animals. This arrangement, which appears also among the inferior tribes of some other classes of animals, has received from M. de Quatrefages the name of *phleboterism* (Gr. vein-intestineism). The stomach of the pycnogonidæ with its cæca floats almost freely within the general cavity of the body in a fluid, which is kept in agitation by the movements of the limbs.

PYC NOSTYLE. See INTERCOLUMNIATION.

PYDNA, a city of ancient Macedonia, on the w. coast of the Thermaic gulf, which was taken by Archelaüs after the Peloponnesian war. After his death it became subject to Athens, but was taken from them by Philip and given to Olynthus. Near it took place the great battle between the Romans, under Paulus Æmilius, and the Macedonian general, Perseus, in which the latter was defeated and the Macedonian empire destroyed.

PYGMA'LION, a legendary king and celebrated statuary of the island of Cyprus, who, disgusted with the dissolute character of the women of his island, resolved never to marry. Enamored of a beautiful ivory statue which he had made, he requested Venus to give it life. Embracing it he perceived that it became sensible by degrees, and at last a living maid, whom he married, and became the father of Paphus, the founder of the city Paphus in Cyprus.

PYGMIES (Gr. *pygmæ*, a measure—from the elbow to the hand), a fabulous race of dwarfs in whose existence the ancients believed. Homer says that every spring they were attacked by the cranes on the coasts of Oceanus. Later writers place them at the mouths of the Nile, but we also read of northern pygmies inhabiting the region of Thule, and of pygmies who lived in subterranean dwellings on the eastern side of the Ganges. Greek fancy worked hard to paint the Liliputian dimensions of these creatures. It was said that they cut down every corn-ear with an axe; that when Hercules came into their country, they climbed up his goblet, by the help of ladders, to drink from it; and that when he was asleep two whole pygmy armies fell upon his right, and another on his left, hand, but were all rolled up by the hero in his lion's skin. Aristotle did not believe that the stories about pygmies were utterly fabulous, however much they had been overlaid by fancy with the marvelous. His "rationalistic" (if not rational) interpretation was, that they were probably some diminutive tribe in upper Egypt, who rode very small horses and lived in caves. A race of very small men was encountered by Schweinfurth in his travels in the heart of Africa (1868-71).

PYGMIES OF WESTERN AFRICA. The existence of pygmy races of human beings in Africa has been often asserted, and many circumstances less easily credible than their diminutive size have been reported. See **PYGMIES**. Du Chaillu some time ago discovered the actual existence of a pygmy race, but of whom the diminutive size is the only remarkable characteristic. He found them in the mountainous country on the e. of the southern great branch of the Ogobai. They are called Obongos, are about $4\frac{1}{2}$ ft. in height, and live in the midst of negro tribes of ordinary stature. They subsist chiefly on animal food, but partly also on the roots, berries, and nuts which they find in the forests. Schweinfurth, in his travels in the heart of Africa, 1868-71, also came into contact with a nation of pygmies.

PYLUS, or **PYLOS**, an ancient t. of Messenia in the Peloponnesus, from which Homer's *Nestor* is supposed to have come, though the poet may have referred to the city of the same name in Triphylia. After the second Messenian war the old city was destroyed by the inhabitants; but B.C. 425 the site was fortified by the Athenian forces under Demosthenes the general, and here they gained a noted victory over the Spartans. The present port of Navarino was probably the scene of the naval battle of Sphacteria.

PYM, JOHN, famous as the leader of the popular party in the house of commons in the reign of Charles I., was b. in 1584. He came of a good family in Somersetshire, and had considerable property in that county. He was for some years a gentleman commoner of Pembroke college, Oxford, and afterward studied law at one of the inns of court. Having been sent to parliament as member for Tavistock, in Devonshire, he attached himself to the popular party; and, during the later part of the reign of James I., became noted for his vigorous opposition to the arbitrary measures of the court. In 1626, the year after the accession of Charles I., he distinguished himself by taking a prominent part in the impeachment of the king's favorite, the duke of Buckingham. In 1640, the functions of parliament having been in abeyance for 13 years, during which time the popular discontents had gradually been growing to a head, the celebrated long parliament was convened; and from the first, Pym was by common consent recognized in it as the leader of the opposition to the despotic policy of the monarch. For the position which he thus occupied his qualifications were eminent. In temper, he was bold and fearless; he was master of an eloquence close, terse, and vigorous; and in knowledge of parliamentary form and business procedure, it was considered he had scarcely his equal in the house. On Nov 3, as soon as business had opened, he set forth to the house, in a long and elaborate address, the intolerable grievances under which the nation labored; and a week after, he boldly denounced the earl of Strafford as the "great promoter of tyranny," to whose evil influence on the mind of the king these grievances were in the main to be attributed. In the impeachment of Strafford which followed, resulting in his execution under a bill of attainder passed upon him, Pym took the leading part. Of this master-stroke of policy, which deprived the king of the one man of resolute temper and powerful genius who adhered to his cause, the credit must be chiefly awarded to Pym. In the subsequent proceedings against Laud he was also conspicuous, as in every other crisis of moment, up to the time when war became inevitable between the king and the parliament. On the breaking out of hos-

ilities, he remained at his post in London, and in the exercise of the functions of the executive there, rendered services to the cause not less valuable and essential than those of a general in the field. While the strife was yet pending, he died somewhat suddenly at Derby house, on Dec. 8, 1643, having been appointed to the important post of lieutenant of the ordnance only the month previous. He was buried at Westminster abbey with great pomp on the 13th; and was borne to his last resting-place by six members of the house of commons. The house of commons also voted £10,000 in payment of his debts.

PYNAKER, ADAM, 1621-73; b. Holland, at the village of Pynaker, whose name he retained. He studied at Rome, and obtained a high reputation as a painter. His landscapes, into which he frequently introduces picturesque buildings and ruins, are much esteemed. He painted over 70 pictures.

PYNCHON, JOHN, 1627-1703; b. England; brought to this country when a child by his father, William Pynchon (q.v.). He succeeded to very large landed estates in the Connecticut valley and about Springfield, and also made large purchases of lands from the Indians, with whom he was on excellent terms. He was for many years magistrate of Springfield, and in 1754 was one of the founders of Northampton; was one of the governor's "assistants," and a member of sir Edward Andross's council of New England.

PYNCHON, WILLIAM, 1590-1661; b. Essex co., England. In 1630 he came to Massachusetts in company with John Winthrop, the new gov., and became the treasurer of the colony. He was one of the founders of the town of Roxbury, and about 1637 became chief magistrate of Springfield. In 1650 he sent to England and had published a book called *Meritorious Price of Christ's Redemption*, opposing the Calvinistic view of the atonement. For this he was deposed from the magistracy and the book was burned on Boston common. He returned to England and there published *The Jewes Synagogue* (1652), and *How the First Sabbath was Ordained* (1654).

PYNE, LOTISA, a popular English singer, daughter of a well-known singer, Mr. G. Pyne, was b. in 1824, received instruction from sir George Smart, and first appeared in public in London in 1842. She appeared in Paris in 1847, made her *début* in opera in 1849, and has since visited America. She is chiefly known from her being chief soprano of an English opera company, in which she was associated with Mr. Harrison at the Lyceum, Drury Lane, and Covent Garden.

PYRACANTHA. See **CRATEGUS.**

PYRAMID, in geometry, is a solid figure, of which the base is a plane rectilinear figure, and the sides are triangles, converging to a point at the top or "apex." Pyramids, like prisms, are named from the form of their bases; thus, a pyramid having a triangle for its base is a triangular pyramid; with a square base, a square pyramid; with any four-sided figure for its base, a quadrangular pyramid; or it may be pentagonal, hexagonal, etc. Pyramids may be either "right" or "oblique." See **PRISM.** A right pyramid, with an equilateral figure for its base, has all its sloping edges equal; but this is not the case if the pyramid be oblique. The most remarkable property of the pyramid is, that its volume is exactly one-third of that of a prism having the same base and vertical height; and it follows from this, that all pyramids having the same base and height are equal to each other.

PYRAMID, a structure of the shape of the geometric figure so called, erected in different parts of the old and new world, the most important being the pyramids of Egypt and Mexico. Those of Egypt were considered one of the seven wonders of the world, are 70 in number, of different sizes, are between 29° and 30° n. lat.; and are masses of stone or brick, with square bases, and triangular sides. Although various opinions have prevailed as to their use, as that they were erected for astronomical purposes, for resisting the encroachment of the sand of the desert, for granaries, reservoirs, or sepulchers, the last-mentioned hypothesis has been proved to be correct in recent times by the excavations of the late gen. Howard Vyse, who is said to have expended nearly £10,000 in investigating their object and structure. They were all the tombs of monarchs of Egypt who flourished from the fourth to the twelfth dynasty, none having been constructed later than that time; the subsequent kings being buried at Abydos, Thebes, and other places, in tombs of a very different construction. The meaning of the word pyramid is involved in great obscurity; although attempts have been made to derive it from the Coptic *piharam*, yet, as in the hieroglyphs, it is found in connection with the words *ben ben* or *ber ber*, forms of the Coptic *beebe mahou*, or tomb, and *abmer*, or sepulcher, it is probably an ancient Greek word. The pyramids are solid mounds raised over the sepulchral chambers of the kings, the first act of an Egyptian monarch being to prepare his future "eternal abode." For this purpose, a shaft of the size of the intended sarcophagus was first hollowed in the rock at a suitable incline to lower it, and at a convenient depth a rectangular chamber was excavated in the solid rock. Over this chamber a cubical mass of masonry, of square blocks, was then placed, leaving the orifice of the shaft open. Additions continued to be made to this cubical mass both in height and breadth as long as the monarch lived, so that at his death all that remained to be done was to face or smooth the exterior of the step-formed mound. But in some cases the masonry passed beyond the orifice of the shaft, which involved the construc-

tion of a new shaft, having its orifice beyond it. The pyramid was faced by adding courses of long blocks on each layer of the steps, and then cutting the whole to a flat or even surface, commencing from the summit. The outer masonry, however, or casing, as it is called, has in most instances been partially stripped off. Provision was made for protecting the vertical joints by placing each stone half way over another. The masonry is admirably finished; and the mechanical means by which such immense masses of stone were raised to their places has long been a mystery; the discovery, however, of large circular holes in some of the stones has led to the conclusion that they were wound up by machines. The stones were quarried on the spot; sometimes, however, granite taken from the quarries of Syene was partially employed. The entrances were carefully filled up, and the passage protected by stone portcullises and other contrivances, to prevent ingress to the sepulchral chamber. There appears to have been also a door or pylon at the entrance of the shaft, ornamented with Egyptian sculptures and hieroglyphs. The sides of the pyramids face the cardinal points, and the entrances face the north. The work of the larger pyramids was executed by *corvées* of laborers. The most remarkable and finest pyramids are those of Gizeh, situated on a level space of the Libyan chain at Memphis, on the w. bank of the Nile. The three largest are the most famous.

The first or Great Pyramid, as appears from the excavations of Vyse, was the sepulchre of the Cheops of Herodotus, the Chembes, or Chemmis, of Diodorus, and the Suphis of Manetho and Eratosthenes. Its height was 480 ft. 9 in., and its base 764 ft. square; in other words, it was higher than St. Paul's cathedral, on an area the size of Lincoln's Inn Fields. Its slope or angle was $51^{\circ} 50'$. It has been, however, much spoiled and stripped of its exterior blocks for the building of Cairo. The original sepulchral chamber, called the subterranean apartment, 46 ft. \times 27 ft., and 11 ft. 6 in. high, has been hewn in the solid rock, and was reached by the original passage of 320 ft. long, which descended to it by an entrance at the foot of the pyramid. The excavations in this direction were subsequently abandoned, on account of the vast size attained by the pyramid, which rendered it impracticable to carry on the entrance on a level with the natural rock, which had been cut down and faced for that purpose. Accordingly, a second chamber, with a triangular roof, was constructed in the masonry of the pyramid, 17 ft. \times 18 ft. 9 in., and 20 ft. 3 in. high. This was reached by a passage rising at an inclination of $26^{\circ} 18'$, terminating in a horizontal passage. It is called the queen's chamber, and occupies a position nearly in the center of the pyramid. The monument—probably owing to the long life attained by the monarch—still progressing, a third chamber, called the king's, was finally constructed, by prolonging the ascending passage of the queen's chamber for 150 ft. further into the very center of the pyramid, and after a short horizontal passage, making a room 17 ft. 1 in. \times 34 ft. 3 in., and 19 ft. 1 in. high. To diminish, however, the pressure of the superincumbent masonry on the flat roof, 5 small chambers were made vertically in succession above the roof, the last one pointed, varying in height from 1 ft. 4 in. to 8 ft. 7 in., the apex of the top one being rather more than 69 ft. above the roof of the king's chamber. The end of the horizontal passage was finished in a superior style, and cased with red Syenitic granite: and in the king's chamber was the granite sarcophagus of the king Cheops, 7 ft. $6\frac{1}{2}$ in. long, 3 ft. 3 in. broad, and 3 ft. 5 in. high, for whom the pyramid was built.* As the heat of this chamber was stifling, owing to want of ventilation, two small air-channels, or chimneys about 9 in. square, were made, ascending to the n. and s. sides of the pyramid. They perfectly ventilate this chamber. After the mummy was deposited in the king's chamber, the entrance was closed with granite portcullises, and a well made at the junction of the upward-inclined and horizontal passages, by which the workmen descended into the downward-inclined passage, after carefully closing the access to the sepulchral chambers. The changes which took place in this pyramid gave rise to various traditions, even in the days of Herodotus, Cheops being reported to lie buried in a chamber surrounded by the waters of the Nile. It took a long time for its construction—100,000 men being employed on it for 30 years, or more probably for above half a century, the duration of the reign of Cheops, which is dated by different chronologists at 3,229, 3,095, or 2,123 B.C. The operations in this pyramid by gen. Vyse gave rise to the discovery of marks scrawled in red ochre in a kind of cursive hieroglyphs on the blocks brought from the quarries of Tourah. These contained the name and titles of Khufu (the hieroglyphic form of Cheops); numerals and directions for the position of materials: with them were masonic marks.

The second pyramid is situated on a higher elevation than the first, and was built by Suphis II., or Kephren, who reigned 66 years, according to Manetho, and appears to have attained a great age. It has two sepulchral chambers, and appears to have been broken into by the caliph Alaziz Othman Ben-Yousouf, 1196 A.D. Subsequently it was opened by Belzoni. The masonry is inferior to the first, but it was anciently cased below with red granite.

The third pyramid, built by Menkara, or Mycerinus, who reigned 63 years, is much

* The opinion that this granite, or porphyry coffer, was a sarcophagus, has been questioned, and the theory has been advanced that it was a standard measure of capacity, of which the British quarter is the fourth part.—See J. Taylor's *The Great Pyramid: Why was it Built?* (1859), and Piazza Smyth's *Our Inheritance in the Great Pyramid* (1864).

smaller than the other two, being only 218 ft. high and 354 ft. 6 in. square. It has also two sepulchral chambers, both in the solid rock. The lower sepulchral chamber, which held a sarcophagus of rectangular shape, of whinstone, had a pointed roof, cut like an arch inside; but the cedar coffin, in shape of a mummy, had been removed to the upper or large apartment, and its contents there rifled. Among the débris of the coffin and in the chambers were found the legs and part of the trunk of a body with linen wrapper, supposed by some to be that of the monarch, but by others to be that of an Arab, on account of the ankylosed right knee. This body and fragments of the coffin were removed to the British museum; but the stone sarcophagus was unfortunately lost off Carthage, by the sinking of the vessel in which it was being transported to England. The masonry of this pyramid is most excellent, and it was anciently cased half-way up with black granite.

There are six other pyramids of inferior size and interest at Gizeh; one at Abou Rouash, 5 m. to the n. w. of the same spot, is ruined, but of large dimensions; another at Zowyet El Arrian, also made of limestone, is still more ruined; another at Reegah, a spot in the vicinity of Abooseer, also much ruined, and built for the monarch User-en-Ra, by some supposed to be Busiris. There are five of these monuments at Abooseer, one with a name supposed to be that of a monarch of the third dynasty; and another with that of the king Sahura. A group of 11 pyramids remains at Sakkara, one with a doorway inlaid with porcelain tiles, and having a royal name. Five other pyramids are at Dashour, the northernmost of which, built of brick, is supposed to be that of the king Asychis of Herodotus, and has a name of a king apparently about the twelfth dynasty. Others are at Meydoon and Illahoon; and two at Biahmo, at Medinat El Fyoum, apparently the sepulchers of the last kings of the twelfth dynasty. Some small brick pyramids of the kings of the eleventh dynasty are at the Drah Abou Negger at Thebes. In Nubia, the ancient Æthiopia, are several pyramids, the tombs of the monarchs of Meroë, and of some of the Ethiopian conquerors of Egypt. They are taller in proportion to their base than the Egyptian pyramids, and generally have a sepulchral hall, or propylon, with sculptures, which faces the east. The principal groups of these pyramids are at Bege Rauc, or Begromi, 17° n. lat., in one of which gold rings and other objects of late art, resembling that of the Ptolemaic period, were found.

In Assyria the Birs Nimrud, or tower of Belus, was a kind of step-shaped pyramid of seven different-colored bricks, dedicated to the planets by Nebuchadnezzar. The Mujelibé, another mound, was of pyramidal shape. The pyramid also entered into the architecture of the tomb of Sardanapalus at Tanus, and of the mausoleum of Artemisia at Halicarnassus. A small pyramid, the sepulcher of C. Cestius, imitated from the Egyptian in the days of Augustus, still exists within the wall of Aurelian at Rome. Temples and other monuments of pyramidal shape are found in India, China, Java, the Polynesian islands, and elsewhere. The Toltecs and Aztecs erected temples in Mexico, called *teocalli*, or abodes of gods, of pyramidal shape, with steps or terraces by which to ascend and reach an altar, generally placed on the summit, where they performed human sacrifices and other rites. These, however, are not true pyramids, the pure and simple form of which is restricted to Egypt. The pyramid entered extensively into the architecture of the Egyptians, and appears on the tops of obelisks and tombs as a kind of roof. Small models of pyramids, with inscribed adoration to the sun, or having royal names, were also placed in the tombs.—Lepsius, *Ueber den Bau der Pyramiden*, 1843; *Briefe*, pp. 143, 217; Wilkinson, *Topogr. of Thebes* (Lond. 1835); Vyse, *Operations carried on at Gizeh in 1837* (8vo. Lond., 1840-42); Gliddon, *Ottia Ægyptiaca* (Lond. 1849).

PYRAMID LAKE, in Koop co., Nevada, at an elevation of 4,000 feet. It is about 30 m. long and 10 wide, and has no outlet.

PYRAMUS AND THISBÉ. The tragical history of these two lovers is told by Ovid in the fourth book of his *Metamorphoses*. They were natives of Babylon, and tenderly attached to each other, but their parents would not hear of their marriage; they had to content themselves with clandestine interviews by night. On one occasion they arranged to meet at the tomb of Ninus, where Thisbé, who was first at the trysting-spot, was startled to discover a lioness. She immediately ran off, but in her terror and haste dropped her garment, which the fierce animal, that had just torn an ox in pieces, covered with blood. Soon after Pyramus appeared, and seeing his mistress's robe, came to the conclusion that she had been murdered, whereupon he killed himself. Thisbé now returned, and beholding her lover lying dead on the ground, put an end to her own life. The story was a favorite one during the middle ages, when a couple, unhappy in their love, were termed a *Pyramus and Thisbé*. Shakespeare, in his *Midsummer Night's Dream*, has introduced it—but in a way that has the effect of caricature.

PYRENEES, the name of that mountain-range which, separating France from Spain, extends 270 m. in length, and from 30 to 70 m. in breadth, from the gulf of Rosas, in the Mediterranean, to the s. e. corner of the bay of Biscay. This mountain-system, covering an area estimated at 12,600 sq. m., consists of two great chains, one of which runs e. from the Bidassoa to the w. bank of the Noguera Pallaresa; and the other, originating in the Pic du Midi d'Ossau (9,510 ft.), lat. about 0° 25' w., a little to the n. of the former, extends eastward, and, after being intersected at the Val d'Aran by the Garonne and many smaller streams, reaches the Mediterranean, on the shores of which, immediately

n. of the gulf of Rosas, it terminates in the promontories of Norfeo and Creuz. The northern slopes of these mountains to the plains and undulating districts of the s.w. of France, are of gradual descent; while the southern slopes descend to the mountainous regions of northern Spain by steep terraces. That portion of this mountain-system in which the eastern part of the southern, and the western part of the northern chains run parallel to each other, is called the high or middle Pyrenees—a district about 16 m. in length, and forming the wildest and most elevated portion of the whole system. In the s.w. of the middle Pyrenees is a series of lofty summits, beginning with the Pic du Midi de Pau (9,544 ft.), and ending with the barren Maladetta, whose highest point, the Pic de Nethou or Malahite (11,168 ft.), is the highest summit in the system. Between these two summits, there are several upward of 10,000 ft. high, as mont Perdu (10,994 feet). The north-eastern and less elevated portion of the middle Pyrenees forms a rampart, frequently interrupted by transverse valleys, and of which the principal summits are the Pic de Gaviso (8,170 ft.) and the Pic du Midi de Barèges (9,307 feet). The eastern Pyrenees rise in their highest summits into the region of perpetual snow, and as far as the sources of the Segre, form a mighty unbroken wall of rock. From this point, however, they assume a different character, decreasing in height, and being intersected by valleys. The west Pyrenees nowhere reach the snow-line, as their highest summit, the Pic d'Anie, does not rise above 7,500 feet. Forming at first ridges of from 6,000 to 7,000 ft., they decrease in height as they extend w., until, on the lower Bidassoa, they take the form of isolated masses about 3,000 ft. high. The average height of the Pyrenees is from 6,000 to 7,210 feet. At an almost equal elevation are most of the mountain-passes. These passes, called in some places *cols*, in others *ports* (Span. *puerto*), are about 100 in number, though only seven of them are practicable for wagons and cannon. The most important are the roads of St. Jean de Luz over the Bidassoa to Vittoria, St. Jean Pied du Port to Pampluna, and that from Perpignan over Junquera to Gerona. The Pyrenees comprise no extensive and long valleys. Generally, the valleys are small and caldron-shaped, and communicate by means of narrow passes. The rivers are inconsiderable. The region of perpetual snow, which, on the northern slopes of the mountains, begins at the height of 8,137 ft., and on the southern slopes at 8,858 ft., comprises no extensive snow or ice tracts. Glaciers are few and small, and nowhere occur lower than 7,800 feet. On the warm and dry southern slopes, no glaciers exist. Few forests exist, and the steep walls of rock, parched by the sun and mid-day winds, are either quite bare, or are covered with low brush-wood and meager pasture. The more gradually declining northern slopes, on which snow and springs are more abundant, show a richer vegetation, and are for the most part covered with lofty forests, and beautiful mountain pasture. Granite forms the kernel of the Pyrenean mountain-system, and is overlaid by chalk and sandstone masses. The Pyrenees are not rich in metals, but abound in mineral springs, of which the chief are those of Bagnères de Bigorre (q. v.), and Barèges.

PYRÉNÉES, BASSES, a department forming the s.w. corner of France. Area, 2,940 sq. m.; pop. '76, 431,525. The department is divided into five arrondissements of Pau, Oloron, Orthez, Bayonne, and Mauléon. Chief town, Pau. The Aasses-Pyrénées occupies the northern slopes of the western Pyrenees, offshoots from which divide the department into a number of valleys, each traversed by a clear mountain stream, locally known as a *gave*. The chief of these are the gave d'Oloron, gave de Pau, the Didouze, and Nivelle. The high valleys and slopes are generally fertile, and well adapted for the growth of the vine, chestnut, various other fruits, and maize, though not for wheat. The best wines are those of Jurançon and Gau, Pontac and Auberlin. Flax and hemp, rye, barley, oats, and millet are also grown; but the principal source of industry, after the making of wine, is the rearing of horses, cattle, sheep, and mules for the Spanish markets, and the raising of swine in the great beech-forests, together with the preparation of hams of excellent quality and high flavor. Marble, alabaster, slate, opHITE, copper, iron, sulphur, and cobalt constitute the chief mineral products; but their importance as sources of wealth falls short of that of the numerous mineral springs, the most important of which are those of Biarritz, Cambo, Eaux-Bonnes, and Eaux-Chaudes.

PYRÉNÉES, HAUTES, a department of France, lying e. of the Basses-Pyrénées, is a part of the old province of Gascony. The Hautes-Pyrénées, which, as its name implies, contains the loftiest summits of the Pyrenean chain, is divided into the three arrondissements of Tarbes, Argelès, and Bagnères, and the chief town is Tarbes. The aspect of the scenery is, moreover, very varied—savage mountains and precipitous rocks in the s.; an agreeable diversification of hill with dale in the center, softening down to fertile plains in the north. The principal rivers, none of which, however, are navigable in the department, are the Adour, and the gave de Pau. The climate is generally mild in the plains and sheltered valleys, but even there, storms are of frequent occurrence. The well-cultivated and artificially watered low-lands yield good crops of cereals, leguminous plants, flax, fruits of every kind, including the grape, from which excellent wine and brandy are made. Horses, mules, cattle, sheep, swine, and poultry are much reared. This department, which is the richest part of the Pyrenees in mineral products, especially marble of various kinds, copper, iron, zinc, lead, antimony, slate, granite, etc., contains also the most celebrated springs, as the sulphur springs at St. Sauveur, and the hot baths of Bagnères, Barèges, and Cauterets. The very limited commercial industry

of Hautes-Pyrénées embraces the manufacture of woolen and mixed fabrics, including bareges, coloring matters, leather, paper, cutlery, etc. There is also a smuggling trade with Spain. Area, 1742 sq.m.; pop. '76, 238,037.

PYRÉNÉES-ORIENTALES, a maritime department of France, is bounded on the e. by the Mediterranean, and on the s. by the Pyrenees. Area, 1590 sq.m.; pop. '76, 197,940. It is divided into the three arrondissements of Perpignan, Prades, and Céret. The chief town is Perpignan. Like the two previously described, this department presents a series of parallel valleys formed by spurs from the Pyrenees, but in this case the valleys run e. and west. They are three in number, and are watered by the Gly, Tet (the principal river), and Techis. The s.w. corner is drained by the Segre (Segura), a tributary of the Ebro. An extended plain occupies all the n. and e. of the department. The climate is good, and in the plains is seldom disturbed by great extremes of heat or cold. The vegetable products include fine grain and some of the choicest fruits of this latitude. Wines constitute the wealth of the district, and include the red wines of Roussillon, the white muscatel of Rivesaltes, and other approved kinds. The chief exports are wine, cocoons, the surplus live stock and its products, sardines, anchovies, etc. The mineral wealth of the district is not remarkable.

PYRHELIOMETER, an instrument invented by M. Pouillet, for the purpose of measuring the sun's heat. It consists of a silver plate, coated on the outer surface with lamp-black and containing water or mercury. A thermometer is attached, and by taking into consideration the area of the exposed surface, the quantity of water or mercury, and the degree of heat to which it is raised, the effect of the sun's heat under given conditions is ascertained.

PYRITES, a name employed by mineralogists to designate a large group or *family* of minerals, compounds of metals with sulphur, or with arsenic, or with both. They are crystalline, hard, generally brittle, and generally yellow. The name pyrites originally belonged to the sulphuret of iron, known as IRON PYRITES; and was given to it in consequence of its striking fire with steel (Gr. *pyr*, fire), so that it was used for kindling powder in the pans of muskets before gun-flints were introduced. Iron pyrites is commonly of a bright brass yellow color; it is often found crystallized in cubes in which form small crystals of it are abundantly disseminated in some roofing-slates; and very large ones occur in some of the mines of Cornwall; it is also found crystallized in dodecahedrons and other forms, more rarely in oblique four-sided prisms; and it often occurs massive, globular, stalactitic, capillary, or investing other minerals as an incrustation. Beautiful specimens of globular iron pyrites are found in the chalk of England. It is a very widely diffused and plentiful mineral, and seems to belong almost equally to all geological formations. It is too abundant in many coal-fields, the action of water and air changing it into sulphate of iron (vitriol), during which change so much heat is evolved that the coal is frequently kindled by it, mines become unworkable, and the progress of the fire can only be stopped, if at all, by building up portions of them to cut off the access of air, or by the admission of a plentiful supply of water. At Quarreltown, in Renfrewshire, a deep hollow may still be seen, where, about a century ago, the ground fell in, in consequence of a subterranean fire thus kindled. The color of iron pyrites has often caused it to be mistaken for gold, a mistake which its hardness and comparative lightness should prevent, or its ready solubility in nitric acid, and its burning before the blowpipe on charcoal with bluish flame and smell of sulphur. But it sometimes does contain a small proportion of gold, sometimes even in visible grains. This auriferous iron pyrites is found in Siberia and in South America. Iron pyrites is never used as an ore of iron, but it is much used for the manufacture of sulphuric acid, and sulphur is obtained from it by sublimation. It is also used for the manufacture of alum. A variety of iron pyrites of a very pale color is called *marcasite*. There is also a magnetic variety. **COPPER PYRITES**, also called *yellow copper* and *chalcopyrite*, is the most abundant of all the ores of copper, and yields a large proportion (perhaps a third) of the copper used in the world. It is brass-yellow, the color varying with the amount of copper which it contains, a rich color indicating much copper, and a pale color the presence of a comparatively large amount of iron; for this ore is not a sulphuret of copper, but of copper and iron. It occurs massive and disseminated in rocks of almost every class; and is often found crystallized in octahedrons and tetrahedrons, but generally in very small crystals. It may at once be distinguished from iron pyrites by its comparative softness, yielding readily to the knife, and by the green color of its solution in nitric acid. Before the blowpipe, with borax and soda, it yields a bead of copper. **COBALT PYRITES**, or *cobaltine*, a sulphuret and arseniuret of copper, is a principal ore of cobalt. It is generally of a silver-white color, and occurs massive, disseminated, or crystallized in cubes, octahedrons, dodecahedrons, and polyhedrons, in primitive rocks. **NICKEL PYRITES**, also called *copper-nickel* and *nickeline*, used as an ore of nickel, is a compound of nickel and arsenic. It is generally found massive, and is of a copper-red color.

PYRITZ, a very ancient t. of Prussian Pomerania, in the government of Stettin, 25 m. s.e. of the town of Stettin. There are standing five high towers on the town-walls, built by the Wends, under whom it was a place of great strength. There is a seminary named after Otto, bishop of Bamberg, near the spring where it is said he, in 1124, baptized the

first Pomeranian converts. Pyritz has manufactures of woolen cloth and leather. Pop. 75, 7,443.

PYRMONT. See WALDECK-PYRMONT.

PYROLA AND PYROLA'CEÆ. See WINTER GREEN.

PYROLIG'NEOUS ACID, or WOOD VINEGAR, a crude commercial from of acetic acid (q.v.). It is made by the destructive distillation of wood, and contains, besides acetic acid, tar and other products, which have to be removed if it is required in a very pure state. Generally, it is obtained in Britain from oak branches, which, after being stripped of their bark, are too small for timber purposes. These are cut into short billets, which are placed in cast-iron retorts, and a sufficient heat applied to drive off the volatile constituents and carbonize the wood. The best woods for the distiller are "hard" woods, although all will yield it. This will be seen from the following table, which partly summarizes the experiments of Stolze:

	100 Parts of Dried Wood give	
	Crude Pyro- ligneous Acid.	Pure Hydrated Acetic Acid.
Birch (<i>Betula alba</i>).....	45.0	4.47
Beech (<i>Fagus sylvatica</i>).....	44.0	4.29
Oak (<i>Quercus robur</i>).....	43.0	3.88
Ash (<i>Fraxinus excelsior</i>).....	46.8	3.72
White Poplar (<i>Populus alba</i>).....	45.8	3.23
Bird Cherry (<i>Prunus padus</i>).....	47.3	2.92
Juniper (<i>Juniperus communis</i>).....	45.8	2.34
Spruce fir (<i>Pinus abies</i>).....	41.2	2.16
Scotch fir (<i>Pinus sylvestris</i>).....	42.4	2.14

Quick distillation is always found to be much more productive than slow, and the acid is also freer from impurities; for the slower the process, the thicker and darker is the tarry matter. Hence two separate plans have been invented, one by Mr. Halliday, and the other by Mr. W. H. Bowers, both of Manchester, in which sawdust, chips, shavings, and spent dye-woods are used. In Mr. Halliday's plan, the retort is a long tube, with the fire acting along its entire length; inside is an Archimedean screw, worked by machinery, which passes the sawdust or other material slowly from the commencement to the end, where, by particular contrivance, it falls out in the state of thoroughly carbonized wood. It is supplied by means of a hopper. The volatile matters pass up an outlet-pipe in the upper part of the tubular retort. In Mr. Bowers's plan, the principle is similar, though differently carried out. The sawdust is fed through a hopper which is always kept well supplied, so that, by the pressure of the supply, the escape of vapor may be prevented. An endless chain is worked over four rollers by a small steam-engine, and carries the materials from the hopper by means of projections on the chain along the lower side of the retort, so as to bring them in contact with the furnace. By the time the material reaches the bottom, all the volatile matters have been vaporized, and have passed up into the condenser and the carbonized material falls into a cistern of water into which the open end of the retort dips, the water closing it sufficiently. One of these retorts will yield about 200 gallons per day of pyroligneous acid. This acid is of great use in the arts, especially in making the acetates used by dyers and calico printers; and it is also, when very carefully purified and properly diluted with water, used extensively as a substitute for common vinegar in pickling, and even for table use.

PY ROMANCY. See DIVINATION.

PYROMA'NIA is an involuntary, motiveless tendency to destroy by means of fire. The blind instinct to burn is often manifested in children before reason or a knowledge of property can actuate them, and with no other object than mischievous destructiveness, or to enjoy the blaze of a conflagration. In a large number of the cases, where legal investigation has disclosed the mental condition of the incendiary, and where the motive could not be determined, or was obscure or inadequate, the perpetrators were youthful, of the female sex, and about the period of puberty. It is to be observed that the most remarkable example in modern times of this morbid tendency appearing epidemically, was presented in Normandy in 1830, where barns, granges, and vineyards over a large tract of country were consumed, and where the actors were exclusively girls. When apprehended in numbers they confessed that, though prompted by *internal sensations*, they had no other explicable purpose than to see the light. But this is the pure and typical form of the propensity. In general, insane incendiarism is the result of, or is complicated with, a very obvious incentive. Jonathan Martin, being insane, but impelled by superstition, set fire to York Minster (1829); and passions and delusions of every character, personal and political antipathies, and the spirit of agrarian outrage, may seek gratification in this kind of desolation. Like other outbursts of frenzy, it has been observed to accompany famines, pestilences, and great social convulsions.—Feuchtersleben, p. 293; Marc, *De la Folie*, t. ii, p. 305.

PYROMETER (Gr. *pyr*, fire, and *mētron*, a measure) is a term originally applied by Muschenbroek in 1731, to an instrument which he invented for measuring the changes

produced in the dimensions of solid bodies by the application of heat. It is, however, now applied to any instrument the object of which is to measure all gradations of temperature above those that can be indicated by the mercurial thermometer (q. v.). Desaguliers gives a description of Muschenbroek's instrument, as improved by himself, in his *Experimental Philosophy*. Numerous pyrometers have since been invented, among which may be noticed those of Ellicott (described in *The Philosophical Transactions* for 1736 and 1751), Graham (in do. for 1754), Wedgwood (in do. for 1782, 1784, and 1786), and Guyton (in the *Annales de Chimie*, tome 46). None of these instruments, however, gave accurate results for very high temperatures; and it was not till the year 1821 that prof. Daniell announced the invention of his pyrometer, which has supplanted all others, and for which, in an approved form, he received the Rumford medal from the royal society. It consists of two distinct parts, the *register* (1) and the *scale* (2). The register is a solid bar of black-lead earthenware, A, 8 in. long, cut out of a common black-lead crucible. In the axis of this, a hole is drilled, reaching from one end of the bar to within half an inch of the other extremity; and in this cylindrical cavity a bar *aa*, of metal (as platinum or iron, for example) is placed. A cylindrical piece of porcelain, *cc*, sufficiently long to project a short distance beyond the extremity of the black-lead bar, is placed on the top of the metallic bar. This is termed the index, and it is kept firmly in its position by a ring or strap of platinum, *d*, which is tightened by a wedge of porcelain, *e*. When the register is exposed to a high temperature, the expansion of the metallic rod, *aa*, forces the index forward; and when the register has afterward cooled, the tension of the strap will retain the index at the furthest point to which it has been protruded. The scale (2) consists of a frame composed of two rectangular plates of brass, *f*, *g*, joined together by their edges at a right angle, and fitting square upon two sides of the register. Near the end of this frame is a small brass plate, *h*, which projects at a right angle. To the extremity of the frame nearest the brass plate is attached a movable arm, D, turning round a fixed center, *i*, and at its free end carrying the arc of a circle, E, the radius of which is 5 in., and, which is accurately graduated into degrees and thirds of a degree. Upon this arm, at the center, *k*, another lighter arm, C, is made to turn, carrying at its longer part a vernier (q. v.), H, which moves on the face of the arc, and divides it into minutes, together with an eye-glass, *l*, to assist the reading; while the shorter part terminates in a knife-edge *m*, turned inwards at a right angle.

To use the instrument, the scale is carefully applied, the brass plate, *h*, being pressed upon the shoulder of the register, and the lighter arm being so placed that the steel point, *m*, may rest on the top of the index in a notch cut for it which coincides with the axis of the rod. The position of the index being then read off on the scale, the register is detached and exposed to the heat to be measured; after it is removed and cooled, it is again placed in the scale, and the new position of the index read off; the difference of the two readings determining the expansion of the metallic bar above that of the black-lead. In order to employ the instrument as a measure of temperature as well as of expansion, prof. Daniell adopted the doubtful assumption that equal increments of length are the effects of equal increments of temperature. For further information on this instrument and its uses, we must refer to the original memoir in the *Philosophical Transactions* for 1830-31.

In the great exhibition of 1851, Mr. Ericsson exhibited in the United States' department a pyrometer in which temperatures were indicated by the tension of a permanent volume of air or of nitrogen gas, which was measured by the reading of a column of mercury under a vacuum. For a description of the instrument, we must refer to the jury report. M. Edmond Becquerel published in 1864 a very complete essay on pyrometry in the *Annales du Conservatoire*.

PYROPE, a beautiful and much-prized gem, often called *carbuncle* and *hyacinth* by lapidaries. It is nearly allied to garnet. It is composed of silica, alumina, magnesia, lime, and the protoxides of iron, chrome, and manganese. It is always of a deep red color, and is transparent, or at least translucent. It generally occurs in roundish grains, but rarely in imperfectly cubical crystals. It is found chiefly in Saxony and Bohemia; also at Elie, in Fife, Scotland. The specimens found at Elie are popularly called *Elie rubies*.

PYROPHONE, or **FLAME ORGAN**, a word of Greek origin meaning flame organ, the name of a musical instrument invented by M. Kastner of Paris. The musical tones are produced by circles of small gas jets burning in glass tubes, varying in length and diameter, and arranged like those of an ordinary organ. The jets of flame are spread apart so as to produce the tones, or brought together so as to cause the sound to cease by means of a mechanical contrivance worked by keys like those of a piano-forte.

PYROPHORUS (from the Gr. *pyr*, fire, and *phero*, I bear) is a term applied to any substances which take fire from the rapidity with which they are oxidized. If iron, cobalt, or nickel be reduced by hydrogen from its oxide at a low red heat, it is obtained in a state of such extreme division as to become incandescent by the oxidizing action of the atmosphere; and the tendency to rapid oxidation is much increased by the interposition of some infusible matter, as a little alumina or magnesia, between the particles of the oxide. This is probably due to the cohesion of the minute particles of the reduced metal being thus mechanically prevented, and the access of air to the surface of

each particle being thus facilitated. If tartrate of lead be heated in a tube all the organic portion becomes charred, the metallic lead is reduced to a state of extreme subdivision, and usually takes fire when poured into the air. If finely-powdered sulphate of potash be mixed with half its weight of lamp-black, and heated in a covered crucible, the sulphate is reduced to sulphide of potassium, which remains in a finely-divided state, mixed with the excess of carbon, and takes fire spontaneously in the air from the rapid absorption of oxygen. These are among the best examples of pyrophori.

PYRO SIS, or **WATERBRASH**, is a modification of dyspepsia, or indigestion, characterized by a burning sensation at the pit of the stomach, followed by the eructation of a considerable quantity of a thin, watery fluid, which is generally tasteless, but sometimes sour, and is often described by the patient as being cold. It occurs in paroxysms, which usually come on in the morning or forenoon, when the stomach is empty. The first symptom of it is a pain at the pit of the stomach, and a sense of constriction, as if the stomach were drawn toward the back. The pain is often very severe, and after continuing for some time it brings on the discharge of fluid which has been already mentioned, after which it lessens, and gradually disappears. When the attack has once occurred, it is commonly repeated at intervals for a considerable time. It is usually accompanied with other symptoms of dyspepsia, and is sometimes associated with organic disease of the stomach or of the liver. It seems to be due in a great measure to indigestible diet and the too free use of spirits. When no organic disease is present, the affection usually disappears under the use of a well-regulated diet, and the administration of opium, combined with astringents (as in the compound kino powder), care being taken to guard against the constipating effect of these drugs by the prescription of a mild aperient daily, as, for example, a little confection of senna, or 3 grains of the compound colocynth pill, combined with 2 grains of extract of hyoscyamus. If this treatment fail, nitrate of bismuth, or oxide of silver, in appropriate doses, may be tried. In some cases a cure has been effected by the use of lime-water and milk.

PYROSOMIDÆ, a family of tunicated mollusks forming the order *dactylobranchiata* of Owen. They are marine, and swim freely in the water, many individuals usually combined together, by their elastic integument or *tunic*, into a mass of definite form and arrangement, nearly cylindrical, hollow, closed at one end, and open at the other. The individuals which form this group or mass have each a gill-sac with two gills, and inhale water by an orifice on the outer surface of the cylinder, expelling it by another orifice on the inner surface; and by the action of the stream of water, which thus constantly flows from the open end of the cylinder, the whole mass is slowly propelled through the water with the closed end foremost. The pyrosomidæ are plentiful in warm seas. *Pyrosoma Atlanticum* is usually from three to seven inches long. The Pyrosomidæ are brightly luminous.

PYROTECHNY, the art of making fireworks, is of unknown antiquity. It was practiced among the Chinese from the earliest times, and has attained with them a perfection unknown in other countries. So much is this the case, that they treat as insignificant the most brilliant of our European displays. In their fireworks they introduce many surprises, such as figures of men and animals darting out, but they are somewhat deficient in the mechanical arrangements. Fireworks, as the name is now understood, were hardly known in Europe until the discovery of the composition of gunpowder, and for a long time only very simple pyrotechnic contrivances were used. At present they may be divided into two kinds—the simple hand pieces, such as squibs, crackers, rockets, etc.; and the other, the fixed contrivances which have often very ingenious mechanical arrangements for making some of their parts revolve rapidly when being discharged. The materials used are gunpowder, sulphur, charcoal, saltpeter, filings of steel, iron, copper, etc., and several salts, such as nitrate of strontian, acetate of copper, common salt, etc. The ingredients of fireworks are usually filled into paper cases, made by rolling pasted paper round a cylinder of wood, of the proper diameter, until the case is of sufficient thickness, and then cutting the paper tube so formed into the required lengths for squibs, Roman candles, small rockets, and similar articles; they seldom exceed ten inches; one end of each is closed by drawing a piece of string tightly round, so as to pinch it in, or *choke* it, as it is technically called, and then dipping it into melted resin, which effectually seals it. The combustible ingredients are filled in at the open end, and, if necessary, are rammed down with a wooden ramrod; the opening is afterward covered with a piece of touch-paper, to prevent the composition falling out, and to ignite it by. The effects produced by fireworks are either streams of fire issuing straight out of the cases, and much varied with sparks in the form of stars, etc., and colored with brilliant colors, or wheels of beautiful sparks produced by making the cases revolve rapidly. Revolving pieces are made by coiling the paper tube, when not too tightly filled, around a flat wooden center; the force with which the combustion of the materials is carried on, is sufficient to make the board revolve with great rapidity. Small wheels of this kind are called *Catherine wheels*. *Squibs* or *serpents* are made by filling tubes, eight to ten inches in length, with a composition of 1 lb. of niter, 2 oz. of charcoal powder (rather coarse), 4 oz. of gunpowder, 4 oz. of sulphur, and 6 oz. of steel filings. The last is an important ingredient in many fireworks, producing brilliant, feather-like coruscations, which are the more beautiful the larger and cleaner the filings are. *Rockets* are tied to a wooden

stick. When they are about to be discharged, this stick is stuck in the ground, and in that position the igniting point of the rocket is downward; when lighted, it rushes into the air with great velocity, and reaches a considerable height, discharging as it goes a brilliant stream of sparks. Rockets require a hollow center all down the tube; without this they will not rise. At the end of their course, they often discharge brilliant clusters of golden, ruby, emerald, sapphire-like stars, or showers of golden or colored rain, or of fiery serpents. This is produced by a supplementary part, called the *garniture* of the rocket, consisting of a shorter and broader paper tube, called the *pot*, attached to the end of the fusee part of the rocket, and filled with a composition made into a paste with pure alcohol, and cut into stars, or granulated into small round bodies for drops. The serpents for rockets are small fusees, with the same composition as squibs; they are so packed in as to ignite all at once. The white stars are made of niter, 16 parts; sulphur, 8 parts; gunpowder, 3 or 4 parts; nitrate of strontian added, makes them ruby red; sulphate or acetate of copper, and sulphate and carbonate of barytes, green; zinc filings give a blue color. *Yellow stars* and *yellow showers* are made of niter, 16 parts, 10 of sulphur, 4 of charcoal, 16 of gunpowder, and 2 of lamp-black. A deeper and richer golden color is produced by a very slight variation in the composition—viz., 2 parts less of sulphur and charcoal, and 4 additional of gunpowder. Many other ingenious devices are used by masters in the art of pyrotechny, but they are too numerous and too technical to come within the limits of this work. The *Roman candle* is a favorite firework; it is a tube which is held on the ground, and discharges upward a continuous stream of blue or white stars or balls. *Bengal lights* are cases of about an inch or more in diameter, filled with a composition of 7 parts niter, 2 of sulphur, and 1 of antimony. These are much used as signals at sea; they diffuse an immense glare of bluish-white light. *Chinese or jasmine fire*, which is used by itself or in combination with other mixtures, consists of 16 parts of gunpowder, 8 of niter, 3 of finely-powdered charcoal, 3 of sulphur, and 10 of small cast-iron borings; the last must be finer or coarser in proportion to the bore of the case to be filled. The compound devices in fixed fireworks, such as are seen at public entertainments, are very complicated in their structure, and are varied more or less by every artist. One nice point in the arrangement is to insure simultaneous ignition of all the various parts.

PYROXENE. See AUGITE.

PYROXYLIC SPIRIT, WOOD SPIRIT, or METHYLIC ALCOHOL, a peculiar alcohol obtained by the destructive distillation of wood in the manufacture of pyroligneous acid (q. v.). It is one of numerous volatile products of that distillation, and has to be separated from the others by saturating it with the chloride of calcium, with which it combines, and is no longer volatile, except at a greater temperature than 212° F. It is therefore easily separated by means of a steam-bath from its more volatile associates, which are carried off at a temperature below boiling water. A higher temperature is afterward applied to the residue, which is the compound of chloride of calcium and pyroxylic spirit, and the spirit is thus distilled off. Commercially, the discovery of this substance was of great importance, as many of its properties are the same as those of common alcohol; and now, notwithstanding a long opposition from the revenue board, its manufacture and importation are regularly allowed. It is of nearly equal value to alcohol in making varnishes, as it dissolves the resins, oils, and other similar substances. It has a peculiar naphtha-like odor, which is inseparable from it, and prevents its use as a potable spirit at present; but it has been asserted lately that some makers have almost made it odorless, and that it is consequently taking the place of common alcohol in the manufacture of cheap perfumes.

PYROXYLIN, a name for gun-cotton (q. v.).

PYRRHA. See DEUCALION, *ante*.

PYRRHIC DANCE, the most famous of all the war dances of antiquity, is said to have received its name from one Pyrrichos, or, according to others, from Pyrrhus or Neoptolemus, the son of Achilles. Critical scholars, however, content themselves with a general inference deduced from the substantial harmony of the various mythical or legendary accounts given of its origin—viz., that it was a Doric invention. It was danced to the flute, and its time was both quick and light, as may be seen from the Pyrrhic foot, composed of two shorts (~~~~), and the prokeleusmatic, or challenging-foot, of two double-shorts (~~~~). According to Plato, it aimed to represent the nimble motions of a warrior either avoiding missiles and blows, or assaulting the enemy; and in the Doric states it was as much a piece of military training as an amusement. Elsewhere in Greece it was purely a mimetic dance, in which the parts were sometimes represented by women. It formed part of the public entertainments at the panathenaic festivals. Julius Cæsar introduced it at Rome, where it became a great favorite. The *Romaika*, still danced in Greece, is said to be a modern relic of the ancient Pyrrhic dance; but if Dr. Corrigan's description of it (*Ten Days in Athens*, 1861) is correct, it is not easy to see the resemblance.

PYRRHON (Lat. *Pyrrho*), the founder of a school of Greek skepticism, named after him, was a native of Elis, and was born in the first half of the 4th c. B.C. In his youth he is said to have been a painter, but was subsequently attracted to philosophy by the

study of the writings of Democritus. Diogenes Laertius tells us that, along with Anaxarchus (one of his teachers, according to Aristocles), he joined Alexander the great's eastern expedition; and it has been conjectured that, at this period he obtained some knowledge of the opinions and beliefs of the Persian magi and the Indian gymnosophists. He died about the age of 90, after spending a great part of his life in retirement. Pyrrhon's skepticism was by no means of the thorough-going kind that is usually associated with his name, which is synonymous with absolute and unlimited infidelity. He certainly disbelieved in the possibility of acquiring a scientific knowledge of things, but (like Kant) he appears to have tenaciously maintained the reality of virtue and the obligations of morality. So greatly was he revered by his townsmen, on account of his personal excellences, and so little did they consider his philosophical skepticism a barrier to his holding a religious office, that they chose him high-priest of their sacred city, and for his sake declared all philosophers exempt from public taxes. Cicero (not so far wrongly either) ranks him among the Socratics; and, indeed, he was as much opposed to the pretensions of the sophists as Socrates himself, though from a different point of view. Pyrrhon, so far as we know, wrote nothing, and the works of his friend and follower, Timon, are lost.

PYRRHUS, King of Epirus, b. about 318 B.C., a Greek warrior, whose personal bravery and passion for adventurous exploits equals anything recorded of the knights of chivalry, was the son of Æacides, who succeeded to the throne of Epirus by the death of his cousin, Alexander, 326 B.C. Alexander was the brother of Olympias, the mother of Alexander the great; and thus young Pyrrhus was a distant kinsman of the Macedonian hero, whose career of far-stretching conquest he dared to dream of imitating. After experiencing many vicissitudes of fortune in his youth, he became sole king of Epirus in 295 B.C.; and, in the following year, increased his territories by the addition of the western parts of Macedonia, which he obtained in reward for aiding Alexander, son of Cassander, against his brother, Antipater, in their struggle for the paternal inheritance. In 281 B.C. a glorious prospect opened up before the eyes of the restless warrior—nothing less than the conquest of Rome and the western world, which (if he should achieve it) would confer on him a renown equal to that of his Macedonian kinsman. The Tarentines, a Greek colony in lower Italy, then at war with the Romans, sent an embassy to Pyrrhus, in the name of all the Greek colonies in Italy, offering him the command of all their troops against their enemies. The king was overjoyed at the proposal; instantly accepted it; and in the beginning of 280 B.C. sailed for Tarentum with 20,000 foot, 3,000 horse, 2,000 archers, 500 slingers, and a number of elephants. The gay, pleasure-loving Tarentines had no great relish for the rigorous service of war, and were far from pleased at the strict measures taken by Pyrrhus to inure them to its hardships. The first battle between Pyrrhus and the Romans (who were commanded by the consul, M. Valerius Laevinus) took place at the river Siris in Lucania. The contest was long, obstinate, and bloody; and Pyrrhus only succeeded by bringing forward his elephants, whose strange appearance and gigantic size excited a sudden panic among the Romans. It was a hard-bought victory for Pyrrhus, who said, as he looked upon the field, thick-strewn with his numerous dead, "Another such victory, and I must return to Epirus alone." Many of the Italian nation now joined Pyrrhus (for Rome was not liked by her neighbors and dependants), and he proceeded on his march toward central Italy. The Roman senate was thoroughly frightened, and would have come to terms with Pyrrhus but for the stirring speech of old Ap. Claudius Cæcus, which made them resolve to "fight it out" with the foreigner. Pyrrhus, after penetrating to within 20 m. of Rome, found it impossible to proceed further with safety, as one Roman army occupied the city, and another hung upon his flanks and rear. He therefore withdrew to Campania, and thence to Tarentum, where he wintered. The campaign of 279 B.C. was carried on in Apulia, and the principal engagement took place near Asculum. The Romans were again defeated; but Pyrrhus himself lost so heavily that he felt it impossible to follow up his victory, and again withdrew to Tarentum. Here a truce was entered into between the belligerents, and Pyrrhus passed over into Sicily to assist the Sicilian Greeks against the Carthaginians, 278 B.C. His first exploits in that island were both brilliant and successful; but the repulse which he sustained in his attack on Lilybæum broke the spell which invested his name. Soon afterward he became involved in misunderstandings with the Greeks, and in 276 B.C. he quitted the island in disgust, to renew his war with Rome. While crossing over to the mainland the Carthaginians attacked him, and destroyed 70 of his ships, and although he reached Tarentum in safety, his prospects were now much more clouded than at first. In 274 B.C. he fought a great battle with the Romans, under the consul Curius Dentatus, near Beneventum, and was utterly defeated, escaping to Tarentum with only a few personal attendants. He now saw himself forced to abandon Italy and return to Epirus, where he almost immediately engaged in war with Antigonus Gonatas, son of Demetrius, and king of Macedonia. His success was complete, for the Macedonian troops deserted to him *en masse*, and he once more obtained possession of the country; but nothing could satisfy his love of fighting, and in less than a year he was induced to enter on a war with the Spartans. He marched a large force into the Peloponnesus, and tried to take their city, but was repulsed in all his attempts. He then proceeded against Argos, where he met his death, 272 B.C., in the 46th year of his reign.

PYRUS, a genus of trees and shrubs of the natural order *rosaceæ*, suborder *pomœæ*, having a 5-celled fruit, with a cartilaginous endocarp and two seeds in each cell. It includes species differing very much in appearance, in foliage, and in almost everything except the characters of the flower and fruit, and formerly constituting the genera *sorbus*, *aria*, *aronia*, etc.; or included in *mespilus* (see **MEDLAR**) and *crataegus*. Some botanists separate the apples (*malus*) as a distinct genus. Among the species of *pyrus* are some of the most valuable fruits of temperate climates, and some highly ornamental trees and shrubs. See **APPLE**, **PEAR**, **SERVICE**, **ROWAN**, **BEAM-TREE**.

PYTHAGORAS. The life of this celebrated man, the founder of what is known as the Italic school of philosophy, has been so greatly obscured by the mass of legends and incredible stories which gathered in later ages round his name that it is very difficult to arrive at anything like certainty regarding his history and character. That he was a native of the island of Samos, the son of Mnesarchus, a merchant, or, according to other accounts, a signet-engraver, we know on good authority. The date of his birth is very uncertain, but is usually placed about the year 570 B.C.; and all authorities agree that he flourished in the times of Polycrates and Tarquinius Superbus (540-510 B.C.). He is said to have been a disciple of Pherecydes of Syros, of Thales, and Anaximander, and, like other illustrious Greeks, to have undertaken extensive travels for the purpose of adding to his knowledge, in the course of which—lasting, we are told, for nearly 30 years—he visited Egypt (bringing with him, according to the usual story, letters of introduction from Polycrates to Amasis the king) and the more important countries of Asia, including even India. We have every reason to believe that he did, at all events, visit Egypt, and there availed himself of all such mysterious lore as the priests could be induced to impart, from whom possibly he learned the doctrine of metempsychosis, or the transmigration of souls (which was, as is well known, one of the most famous tenets of the Pythagorean school), and whose influence may perhaps be traced in the mystic rites, asceticism, and peculiarities of diet and clothing which formed some of its chief characteristics—though we may consider it as nearly certain that his philosophic and religious system was much less indebted to the influence of other countries than the ancients generally believed. During his travels, we may believe, Pythagoras matured the plans which he afterward carried into action; but finding, on his return to his native island, that the tyranny established there by Polycrates unfitted it for his abode, he quitted Samos, and eventually settled in the city of Croton, in southern Italy. Here he is said to have acquired in a short time unbounded influence over the inhabitants, as well as over those of the neighboring state; and here he established the famous Pythagorean fraternity, or order, which has often been compared with the still more celebrated order founded by Ignatius Loyola in modern times. The adherents of Pythagoras were chiefly found among the noble and the wealthy; these, to the number of 300, he formed into a select society, bound by a sort of vow to himself and to each other, for the purpose of studying the philosophical system of their master and cultivating the ascetic observances and religious rites enjoined by him. They thus formed at once a philosophical school and a religious brotherhood, which gradually assumed the character and exercised the power of a political association also. This political influence, which undoubtedly became very great, was constantly exerted on the side of aristocracy; and to carry out the principles of this form of government, understood in the best sense of the word, seems to have been the ultimate aim of Pythagoras. He is said also to have increased his influence by a practice unknown to the other sages of the ancient world—the admission of women, not probably into his society, but to attendance on his lectures and teaching. Of the internal arrangement and discipline of this fraternity we really know but little. All accounts agree that what was done and taught among the members was kept a profound secret from the outer world. In the admission of members, Pythagoras is said to have exercised the greatest care, and to have relied much on his skill in physiognomy. They then had, it is said, to pass through a long period of probation, intended apparently to test especially their powers of endurance and self-restraint—though probably the assertion that they had to maintain silence for two, or even five years, is an exaggeration of later times. Among the members of the society we are told there were several gradations, and there was also a more general division of his disciples under the names *esoteric* and *exoteric*—the former being applied to all who were admitted to the more abstruse doctrines and sublimer teaching of their master; the latter, to those who received only the instruction open to all. The mode of life seems to have been regulated by Pythagoras in its minutest details. It is well known that he is said to have forbidden all animal food—a consequence, perhaps, of the doctrine of metempsychosis—and also particularly beans (but these statements cannot be relied on), and there is no doubt that temperance of all kinds was strictly enjoined. In the course of instruction, great attention was paid to mathematics, music, and astronomy; and gymnastics formed an important part of the training. Religious teaching was inculcated in the so-called Pythagorean *orgies*, or *mysteries*; and while he outwardly conformed to the usual mode of worship, there is reason to believe that in secret he taught a purer faith. The result of the whole system seems to have been an unbounded reverence on the part of the disciples for their master (of which the well-known *ipse dixit* is a sufficient attestation); in the members of the order an elevated tone of character,

exhibited in serenity of mind and self-possession, extreme attachment to each other, and also supreme contempt for all the outer world. But it was natural that political power, uniformly exercised in one direction by an aristocratic and exclusive society such as this, should in the end excite a wide-spread feeling of jealousy and hatred, which at length, when opportunity was given, caused the overthrow of the fraternity. A war between the cities of Croton and Sybaris, in which the Pythagoreans took a prominent part, ended in the total destruction of the latter city (510 B.C.); and on this success they seem to have presumed so greatly, that they proceeded to more active measures against the popular party than they had yet attempted. A violent outbreak was the consequence; the house in which the leading Pythagoreans were assembled was set on fire, and many perished in the flames. Similar commotions ensued in other cities of southern Italy in which Pythagorean clubs had been formed, and the result was that, as a political organization, the Pythagorean order was everywhere suppressed; though, as a philosophical sect, it continued to exist for many years after. Of the fate of Pythagoras himself different accounts are given; but he is generally supposed to have escaped to Metapontum, and died there (504 B.C.), where his tomb was shown in the time of Cicero.

Pythagoras is said to have been the first to assume the title of *philosopher* ("lover of wisdom") in place of the name *sophos* ("wise"), by which the sages had before been known. Various discoveries in music, astronomy, and mathematics are attributed to him; among others, the proposition now known as the 47th of Euclid, Book I. We have good ground for believing that he was a man of much learning and great intellectual powers, which were specially exerted in the way of mathematical research, as is evinced by the general tendency of the speculations of his school. There is no doubt that he maintained the doctrine of the transmigration of souls into the bodies of men and other animals—which seems to have been regarded in the Pythagorean system as a process of purification—and he is said to have asserted that he had a distinct recollection of having himself previously passed through other stages of existence. We are told that on seeing a dog beaten, and hearing him howl, he bade the striker desist, saying, "It is the soul of a friend of mine, whom I recognize by his voice."

Respecting the system of philosophy actually taught by Pythagoras, we have but little trustworthy testimony. Pythagoras himself, it is all but certain, wrote nothing, and the same seems to have been the case with his immediate successors; we are therefore, in endeavoring to form an idea of the Pythagorean philosophy, obliged to rely almost entirely on the compilations of later writers (mainly Diogenes Laërtius, and the Neo-Platonists, Porphyrius and Iamblichus, all of them long subsequent to the Christian era), who often but imperfectly understood the details they gave. The tendency of the school was "toward the consideration of abstractions as the only true materials of science" (Lewes's *Biographical History of Philosophy*), and to *number* was allotted the most prominent place in their system. They taught that in number only is absolute certainty to be found; that number is the essence of all things; that things are only a copy of numbers; nay, that in some mysterious way, numbers are things themselves. This number theory was probably worked out from the fundamental conception, that, after destroying or disarranging every other attribute of matter, there still remains the attribute number; we still can predicate that the thing is *one*. With this doctrine of number was intimately connected that of the *finite* and the *infinite*, corresponding respectively with the *odd* and the *even* in number; and from a combination of this finite and infinite it was taught that all things in the universe result. The abstract principle of all perfection was *one* and the *finite*; of imperfection, the *many* and the *infinite*. Essentially based also on the same doctrine was the theory of music; the system of the universe, which was conceived as a *kosmos*, or one harmonious whole, consisting of ten heavenly bodies revolving round a central fire, the *hearth* or *altar* of the universe; and the celebrated doctrine of the harmony of the spheres—the music produced, it was supposed, by the movement of these heavenly bodies, which were arranged at intervals according with the laws of harmony—forming thus a sublime musical scale. The soul of man was believed to partake of the nature of the central fire, possessing three elements, reason, intelligence, and passion; the first distinctive of man, the two last common to man and brutes.

The ethical teaching of the Pythagoreans was of the purest and most spiritual kind; virtue was regarded as a harmony of the soul, a conformity with, or approximation to, the Deity; self-restraint, sincerity, and purity of heart were especially commended; and conscientiousness and uprightness in the affairs of life would seem to have been their distinguishing characteristics.

The Pythagorean system was carried on by a succession of disciples down to about 300 B.C., when it seems to have gradually died out, being superseded by other systems of philosophy; it was revived about two centuries later, and lasted for a considerable time after the Christian era—disfigured by the admixture of other doctrines, and an exaggeration of the mysticism and ascetic practices, without the scientific culture of the earlier school.

In addition to the writers above mentioned, scattered and scanty notices—affording, however, really the most trustworthy information that we possess, as to the life and doctrines of Pythagoras—occur in Herodotus, Plato, Aristotle (the latter especially), and a few other authors. Fuller details on the subject will be found in the histories of Greece

by Thirlwall and Grote, in the works of Ritter, Brandis, Tennemann, Erdmann, Ueberweg, and Lewes on the *History of Philosophy*; in Zeller's *Philosophie der Griechen*, and Ferrier's lectures on the same subject; and in Smith's *Dictionary*.

PYTHEAS, h. Massilia, B.C. 4th c.; said to have sailed around the w. coast of Europe, and through the English channel to Thule (supposed to be the modern Iceland). Nothing is accurately known about his life. He gave an account of his first voyage in his *Description of the Ocean*, in which he stated that he traveled through Britain, and that its circumference was over 40,000 stadia. In regard to the island of Thule, he said there was neither air, nor land, nor sea, but a composition of all of them, in which the whole universe was suspended. This substance, which could not be penetrated by land or sea, he had himself seen, and was told that it was "a connecting link of the universe." He puts Thule 6 days' sail from Britain. It seems that he went as far as Iceland, from his observation that the sun never sets during the summer solstice in Thule. On a second voyage he skirted the w. shore of Europe, from Cadiz into the Tanais, a river emptying into the Baltic. He was also a mathematician and astronomer, and was the first to determine the meridian altitude of the sun at the summer solstice by the use of a gnomon. The fragments of his writings were collected and published at Upsala in 1824. Polybius and Strabo speak of him contemptuously, but modern geographers are more favorable in their judgment. It is supposed that he was sent out by the Massilians for the purpose of increasing their commercial connections.

PYTHIA. See DELPHI, *ante*.

PYTHIAN GAMES, one of the four great national festivals of the Greeks, held in the Crissæan plain, near Delphi, are said (according to the prevalent mythological legend) to have been instituted by Apollo after vanquishing the snaky monster, Python, and were certainly in the earliest times celebrated in his honor every ninth year. They were at first under the management of the Delphians, but about 590-586 B.C. the Amphictyons were intrusted with the conduct of them, and arranged that they should be held every fifth year. Some writers state that it was only *after* this date that they were called Pythian. Originally, the contests were restricted to singing, with the accompaniment of cithern-playing; but the Amphictyons added the flute, athletic contests, and horse-racing. By and by, contests in tragedy, and other kinds of poetry, in historical recitations, and in works of art, were introduced, and long continued a distinguishing feature of these games, which are believed to have lasted down to nearly the end of the 4th c. A.D. The prize was a laurel wreath and the symbolic palm-branch. Several of Pindar's extant odes relate to victors in the Pythian games.

PYTHIAS. See DAMON AND PYTHIAS, *ante*.

PYTHON, a genus of serpents of the family *boïdæ* (see BOA), differing from the true boas in having the plates on the under surface of the tail double. The tip of the muzzle is plated; the lips are grooved. The species are all natives of the old world. They are all large; some of them very large, and rivaled in size by no serpents except the boas of America. The name boa is often popularly given to the pythons, and in its ancient use belongs to them. Some of the pythons are known in the East Indies by the name of ROCK SNAKE, as *P. molurus*, a species very extensively diffused. This name is given to some species which belong to the genus or subgenus *hortulia*, one of which, the NATAL ROCK SNAKE (*P. natalensis*), is said to attain so large a size that its body is as thick as that of a man. Although a native of Natal, it is already unknown in the settled parts of the colony. *Python reticulatus* is probably the largest snake of India and Ceylon. It is found also in more eastern regions. What size it attains is not well known. Specimens of 15 or 20 ft. long are common, but it certainly attains a much larger size. It seems to be this snake which is sometimes called ANACONDA. It is rather brilliantly colored, its body being covered with gold and black, finely intermixed. The forehead is marked by a longitudinal brown stripe. Although sluggish for some time after a repast, it is at other times very active, and easily scales the highest garden walls. It feeds on deer and smaller animals; but the largest pythons are said to seize buffaloes, tigers, and even elephants, and to crush them in their coils. In this there is perhaps some exaggeration; but there are well-authenticated stories of snakes in the East Indies quite capable of killing at least the buffalo and the tiger (see *My Indian Journal*, by col. Walter Campbell; Edin. 1864, pp. 126, 127).

PYX (Gr. *pyxis*, a box, properly of boxwood), the sacred vessel used in the Catholic church to contain the consecrated eucharistic elements, which are preserved after consecration, whether for the communion of the sick or for the adoration of the faithful in the churches. Its form has varied very much at different times. Anciently it was sometimes of the form of a dove, which was hung suspended over the altar. More commonly, however, it was, as its name implies, a simple box, generally of the precious metals, or, at least, of metal plated with gold or silver. At present, the pyx is commonly cup-shaped, with a close-fitting cover of the same material. The interior is ordered to be of gold, or at least plated with gold. Like all the other sacred utensils connected with the administration of the eucharist, it must be blessed by a bishop, or a priest delegated by a bishop.

PYX, TRIAL OF THE, the final trial by weight and assay of the gold and silver coins of the United Kingdom, prior to their issue from the mint. It is so called from the pyx, i.e.; box or chest, in which are deposited specimen coins. When the coins are weighed into bags at the mint, two pieces are taken out of each bag, one for assay within the mint, the other for the pyx. The latter are sealed up by three officers and deposited in the chest or pyx. The trial takes place about once in three years by a jury of goldsmiths, summoned by the lord-chancellor. The jury are charged by the lord-chancellor, at the exchequer office, Whitehall, in the presence of several privy-councilors, and of the officers of the mint. Being furnished with a piece of gold and silver from the trial plates deposited in the exchequer, they are required to declare to what degree the coin under examination deviates from them. The jury then proceed to Goldsmith's hall, where assaying apparatus is in readiness, and the sealed packets of coin being delivered to them by the officers of the mint, are first tried by weight, after which a certain number of pieces taken from the whole are melted into a bar, from which the assay trials are taken. A favorable verdict relieves the officers of the mint from responsibility, and constitutes a public attestation of the standard purity of the coin.

Q

Q, THE seventeenth letter of the Latin, English, and other western alphabets, is identical in power with the letter K (q. v.). It is always followed by u.

QUA BIRD, or **QUAWK**. See **NIGHT HERON**, *ante*.

QUACKENBOS, **GEORGE PAYN**, LL.D., b. N. Y., 1826; educated at Columbia college; began the study of law in New York. In 1847 he opened a private school in the city and remained at its head for about 20 years. In 1848 he began to publish the *Literary American*, and continued it for two years. He was the editor of the American edition of Spier and Suremme's French and English Lexicon; has published a novel and some translations, but is best known as the author of a series of text-books very widely used in the schools of the United States. Included in this series are treatises on grammar, arithmetic, U. S. history, natural history, English composition, and rhetoric.

QUADI, an ancient people living in s.e. Germania; of the Suevic race, and inhabiting that part of what is now Bohemia, Lower Austria, and Moravia, which lay between the Sarmatian mountains and Hercynian forests and the Ister or Danube. They were allies of the Marcomanni, their neighbors on the n.w. The Roman emperor Tiberius established a kingdom of the Quadi and made Vannius, one of his generals, king. In 174 B. C. the Quadi, rose against the empire in confederation with other Germanic races, and it was only after stubborn resistance that they were overcome.

QUADRAGESIMA (Lat. "fortieth day"), the name of the lenten season, or more properly of the first Sunday of the lent. It is so called by analogy with the three Sundays which precede lent, and which are called respectively Septuagesima, 70th; Sexagesima, 60th; and Quinquagesima, 50th.

QUADRANGLE, an open square, or court-yard having four sides. Large public buildings—such as Somerset house and the colleges of Oxford and Cambridge—are usually planned in this form.

QUADRANT (Lat. *quadrans*, a fourth part) literally the fourth part of a circle, or 90°; but signifying, in astronomy, an instrument used for the determination of angular measurements. The quadrant consisted of a limb or arc of a circle equal to the fourth part of the whole circumference, graduated into degrees and parts of degrees. The quadrant employed by Ptolemy was of stone, with one smooth and polished side, on which the graduations were made; the quadrant was firmly placed in a meridian plane, with one radius vertical, and the other horizontal. Tycho Brahe, who has a right to be considered as the first great practical astronomer of modern times, fixed his quadrant on a wall, and employed it for the determination of meridian altitudes; he also adjusted others on vertical axes for the measurement of azimuths. Picart was the first who applied telescopic sights to this instrument. About this time the large mural quadrant (of 6 to 8 ft. radius) began to be introduced into observatories. These quadrants were adjusted in the same way as the mural circle (see **CIRCLE**, **MURAL**). Various innate defects of the quadrant as an instrument—such as the impossibility of securing exactness of the whole arc, concentricity of the center of motion with the center of division, and perfect stability of the center-work—led to its being superseded by the repeating circle, otherwise called the *mural circle*.

Hadley's quadrant is more properly an *octant* as its limb is only the eighth part of a circle, though it measures an arc of 90°.

Its principle is that of the Sextant (q. v.).

QUADRATIC EQUATIONS. See **EQUATIONS**.

QUADRATURE. This term is employed in mathematics to signify the process of determining the area of a surface. Its derivation sufficiently indicates its nature—i.e., it consists in determining a *square* (the simplest measure of surface) whose area is equal to that of the assigned surface. In many cases, of which the triangle (q. v.), the parabola (q. v.),

and the cycloid (q. v.) are perhaps the simplest, the area is easily assigned in terms of some simple unit. Thus, the area of a triangle is half that of the rectangle with the same base and height; that of any parabolic segment is two-thirds of the corresponding triangle, whose sides are the chord and the tangents at its extremities; that of the cycloid three times that of its generating circle, etc.

The term is also applied in a special sense in cases in which an area or other quantity is expressed by an integral, whose value cannot be determined exactly; and it then means the process of approximation by which the value of the integral can be gradually arrived at.

All the practical rules for approximating to the areas of curvilinear figures, and the volumes of various solids—such as occur in land-measuring, gauging, engineering, etc.—are, in this sense, cases of quadrature, except in those very special cases in which an area or a volume can be assigned exactly as a finite function of its dimensions. See **MENSURATION**.

QUADRATURE OF THE CIRCLE. This is one of the grand problems of antiquity, which, unsolved and probably unsolvable, continue to occupy even in the present day the minds of many curious speculators. The trisection of an angle, the duplication of the cube, and the perpetual motion have found, in every age of the world since geometry and physics were thought of, their hosts of patient devotees. The *physical* question involved in the perpetual motion (q. v.) is treated of under that head; and we shall now take the opportunity of noticing the *mathematical* questions involved in the other problems above mentioned; but more especially that of the quadrature of the circle, in which the difficulty is of a different nature from that involved in the other two geometrical ones. A few words about them, however, will help as an introduction to the subject.

According to the postulates of ordinary geometry, all constructions must be made by the help of the circle and straight line. Straight lines intersect each other in but *one* point; and a straight line and circle, or two circles, intersect in *two* points only. From the analytical point of view we may express these facts by saying that the determination of the intersection of two straight lines involves an equation of the *first* degree only; while that of the intersection of a straight line and a circle, or of two circles, is reducible to an equation of the second degree. But the trisection of an angle, or the duplication of the cube, requires for its accomplishment the solution of an equation of the *third* degree; or, geometrically, requires the intersections of a straight line and a curve of the third degree, or of two conics, etc., *all of which are excluded by the postulates of the science.* If it were allowed that a parabola or ellipse could be described with a given focus and directrix, as it is allowed that a circle can be described with a given radius about a given center, the trisection of an angle and the duplication of the cube would be at once brought under the category of questions resolvable by pure geometry; so that the difficulty in these cases is one of mere restriction of the postulates of what is to be called geometry.

It is very different in the case of the quadrature of the circle, which (the reader of the preceding article will see at once) means the determination of the area of a circle of given radius—literally, the assigning of the side of a square whose area shall be equal to that of the given circle.

The common herd of “squarers of the circle,” which grows more numerous every day, and which includes many men of undoubted sanity, and even of the very highest business talents, rarely have any idea of the nature of the problem they attempt to solve. It will, therefore, be our best course to show first of all *what has been done* toward the solution of the problem; we shall then venture a few remarks as to *what may yet be done*, and in what direction philosophic “squarers of the circle” must look for real advance.

In the first place, then, we observe that *mechanical processes are utterly inadmissible.* A fair approximation may, no doubt, be got by measuring the diameter of a circular disk of uniform material, and comparing the weight of the disk with that of a square portion of the same material of given side. But it is almost impossible to execute any measurement to more than six places of significant figures; hence, as will soon be shown, this process is at best but a rude approximation. The same is to be said of such obvious processes as wrapping a string round a cylindrical post of known diameter, and comparing its length with the diameter of the cylinder: only a rude approximation to the ratio of the circumference of a circle to its diameter can thus be obtained.

Before entering on the history of the problem, it must be remarked that the Greek geometers knew that the area of a circle is half the rectangle under its radius and circumference (see **CIRCLE**), so that the determination of the length of the circumference of a circle of given radius is precisely the same problem as that of the quadrature of the circle.

Confining ourselves strictly to the best ascertained steps in the history of the question, we remark that Archimedes proved that the ratio of the diameter to the circumference is greater than 1 to $3\frac{1}{7}$, and less than 1 to $3\frac{1}{6}$. The difference between these two extreme limits is less than $\frac{1}{1120}$ of the whole ratio. Archimedes' process depends upon the obvious truth, that the circumference of an inscribed polygon is less, while that of a circumscribed polygon is greater, than that of the circle. His calculations were extended to regular polygons of 96 sides.

Little more seems to have been done by mathematicians till the end of the 16th c., when P. Méius gave the expression for the ratio of the circumference to the diameter as the fraction $\frac{355}{113}$, which, in decimals, is true to the seventh significant figure inclusive. Curiously enough, it happens that this is one of the convergent fractions which express in the lowest possible terms the best approximations to the required number. Méius seems to have employed, with the aid of far superior arithmetical notation, a process similar to that of Archimedes.

Vieta shortly afterward gave the ratio in a form true to the tenth decimal place, and was the first to give, though of course in infinite terms, an exact formula. Designating, as is usual in mathematical works, the ratio of the circumference to the diameter by π , Vieta's formula is:

$$\frac{1}{\pi} = \frac{1}{2} \sqrt{\frac{1}{2}} \times \sqrt{\frac{1}{2} + \frac{1}{2}} \sqrt{\frac{1}{2}} \times \sqrt{\frac{1}{2} + \frac{1}{2}} \sqrt{\frac{1}{2} + \frac{1}{2}} \sqrt{\frac{1}{2}} \times \text{etc.}$$

Shortly afterward, Adrianus Romanus, by calculating the length of the side of an equilateral inscribed polygon of 1073741824 sides, determined the value of π to 16 significant figures; and Ludolph von Ceulen, his contemporary, by calculating that of the polygon of 36893488147419103232 sides, arrived (correctly) at 36 significant figures. It is scarcely possible to give, in the present day, an idea of the enormous labor which this mode of procedure entails even when only 8 or 10 figures are sought; and when we consider that Ludolph was ignorant of logarithms, we wonder that a lifetime sufficed for the attainment of such a result by the method he employed.

The value of π was thus determined to $\frac{1}{3 \times 10^{35}}$ of its amount, a fraction of which, after Montucla, we shall attempt to give an idea, thus: Suppose a circle whose radius is the distance of the nearest fixed star (250,000 times the earth's distance from the sun), the error in calculating its circumference by Ludolph's result would be so excessively small a fraction of the diameter of a human hair as to be utterly invisible, not merely under the most powerful microscope yet made, but under any which future generations may be able to construct.

These results were, as we have pointed out, all derived by common arithmetical operations, based on the obvious truth that the circumference of a circle is greater than that of any inscribed, and less than that of any circumscribed polygon. They involve none of those more subtle ideas connected with limits, infinitesimals, or differentials; which seem to render more recent results suspected by modern "squarers." If one of that unhappy body would only consider this simple *fact*, he could hardly have the presumption to publish his 3.125, or whatever it may be, as the accurate value of a quantity which by common arithmetical processes, founded on an obvious geometrical truth, was several centuries ago shown to be greater than

$$3.14159265358979323846264338327950288,$$

and less than

$$3.14159265358979323846264338327950289.$$

We now know, by far simpler processes, its exact value to more than 600 places of decimals; but the above result of Von Ceulen is much more than sufficient for any possible practical application even in the most delicate calculations in astronomy.

Snellius, Huygens, Gregory de Saint Vincent, and others, suggested simplifications of the polygon process, which are in reality some of the approximate expressions derived from modern trigonometry.

In 1668 the celebrated James Gregory gave a demonstration of the impossibility of effecting exactly the quadrature of the circle, which, although objected to by Huyghens, is now received as quite satisfactory.

We may merely advert to the speculations of Fermat, Roberval, Cavalleri, Wallis, Newton, and others as to quadrature in general—their most valuable result was the invention of the differential and integral calculus by Newton, under the name of fluxions and fluents. Wallis, however, by an ingenious process of interpolation, showed that

$$\frac{\pi}{4} = \frac{2.4.4.6.6.8.8.10.10. \text{etc.}}{3.3.5.5.7.7.9.9.11. \text{etc.}}$$

which is interesting, as being the first recorded example of the determination, in a finite form, of the value of the ratio of two infinite products.

Lord Brouncker, being consulted by Wallis as to the value of the above expression, put it in the form of an infinite continued fraction, thus:

$$\frac{\pi}{4} = \frac{1}{1 + \frac{1}{2 + \frac{9}{2 + \frac{25}{2 + \frac{49}{2 + \text{etc.}}}}}}$$

in which 2 and the squares of the odd numbers appear. This formula has been employed to show that not only π , but its square, is incommensurable.

Perhaps the neatest of all the formulas which have been given for the quadrature of the circle is that of James Gregory for the arc in terms of its tangent—namely:

$$\theta = \tan. \theta - \frac{1}{3} \tan.^3 \theta + \frac{1}{5} \tan.^5 \theta - \text{etc.}$$

This was appropriated by Leibnitz, and formed perhaps the first of that audacious series of speculations from English mathematicians which have for ever dishonored the name of a man of real genius.

If we notice that, by ordinary trigonometry, the arc whose tangent is unity (the arc of 45° or) $\frac{\pi}{4}$, falls short of four times the arc whose tangent is $\frac{1}{2}$ by an angle whose tangent is $\frac{1}{2^{\frac{5}{2}}}$, we may easily calculate $\frac{\pi}{4}$ to any required number of decimal places by calculating from Gregory's formula the values of the arcs corresponding to $\frac{1}{2}$ and $\frac{1}{2^{\frac{5}{2}}}$ as tangents. And it is, in fact, by a slight modification of this process (which was originally devised by Machin), that π has been obtained, by independent calculators, to 600 decimal places.

It is not yet proved, and it may not be true, that the area or circumference of a circle cannot be expressed in finite terms; if it can be, these must (of course) contain irrational quantities. The integral calculus gives, among hosts of others, the following very simple expression in terms of a definite integral:

$$\frac{\pi}{2} = \int_0^{\infty} \frac{dx}{1+x^2}$$

Now it very often happens that the value of a definite integral can be assigned, when that of the general integral cannot; and it is not impossible, so far as is yet known, that the above integral may be expressed in some such form as

$$\sqrt{x} + \sqrt{y},$$

where \sqrt{x} and \sqrt{y} are irrational numbers. Such an expression, if discovered, would undoubtedly be hailed as a solution of the grand problem.

But this, we need hardly say, is *not* the species of solution attempted by "squarers." We could easily, from our own experience alone, give numerous instances of their helpless absurdities, but we spare the reader, and refer him, for further information on this painful yet ridiculous subject, to prof. De Morgan's *Budget of Paradoxes*; and to the very interesting work of Montucla, *Histoire des Recherches sur la Quadrature du Cercle*.

QUADRËNNIUM U'TILË, in Scotch law, means the four years after majority during which a person is entitled to reduce or set aside any deed made to his prejudice during minority. This protection was also given by the Roman law to minors, to enable them to neutralize any unfair advantage that may have been taken of their inexperience during minority. The injury or lesion must have been caused, not by an accident, but by the imprudence or negligence of themselves or of their curators. The proceeding, therefore, must be commenced before the minor attains 25, after which it is too late to seek restitution. See INFANT.

QUADRËGA. See CHARIOT.

QUADRILAT'ERAL, in military language, is an expression denoting a combination of four fortresses, not necessarily connected together, but mutually supporting each other; and from the fact that if one be attacked, the garrisons of the others, unless carefully observed, will harass the besiegers, rendering it necessary that a very large army should be employed to turn the combined position. As a remarkable instance, and a very powerful one, may be cited the Venetian quadrilateral (Austrian till 1866), comprising the four strong posts of Mantua, Verona, Peschiera, and Legnago. These form a sort of outwork to the bastion which the southern mountains of the Tyrol constitute, and divide the n. plain of the Po into two sections by a most powerful barrier. Napoleon III., in 1859, even after the victories of Magenta and Solferino, hesitated to attack this quadrilateral.

QUADRILLE', a dance of French origin, consisting of consecutive dance movements, generally five in number, danced by couples, or sets of couples, opposite to, and at right angles to each other. The name seems to be derived from its having been originally danced by four couples.

QUADRILLE' is a card game, which, as its name denotes, is played by four persons. The number of cards employed is forty, the tens, nines, and eights being discarded from the pack. The rank and order of the cards in each suit vary according as they are or are not trumps, and are different in the black and red suits. The ace of spades, whatever suit be trumps, is always the highest trump, and is called *spadille*; the ace of clubs is always the third highest trump, and is known as *basto*; while the second highest trump, or *manille*, is the deuce of spades or clubs, or the seven of hearts or diamonds,

according to the suit which is trumps, it being always of the trump suit. When the black suits are not trumps, the black cards rank as in whist; and when they are trumps, the order is the same, with the exception, as above mentioned, of the deuce, which then (in the trump suit only) becomes manille, the deuce of the black suit which is not trumps retaining its position as the lowest card. When the red suits are not trumps, the order of rank is as follows: king, queen, knave, ace, deuce, three, four, five, six, seven; but when they are trumps, the ace (of the trump suit only) is raised to the position of the fourth highest trump, under the name of *punto* or *punto*, and the seven (of the trump suit only) becomes, as previously stated, manille. A little consideration will show, that when the black suits are trumps, the number of trump cards is eleven, and twelve when a red suit is trumps. The three highest trumps, spadille, manille, and basto, are called *matadores*, and the player who possesses one of them can, if he have no other trumps in his hand, decline to follow suit if trumps are led, provided the trump led is not a matadore of value superior to his own. After the cards have been shuffled, cut, and dealt, the elder hand, on looking at his cards, may, if his hand be weak, decline to play (or *pass*); the next player may do the same, and so on all round; in which case the elder hand must commence, naming the suit which he wishes to be trumps, and the cards are laid, and the tricks taken, as in ordinary card games. If a player does not pass, but commences the game by naming trumps and playing a card, he must himself make six tricks to win; and if he succeeds, he obtains the whole of the winnings; but if he loses, he pays the whole of the losses. If he commences the game by "asking leave"—i.e., to have a partner—which is done by calling a king, the player who holds the king of the suit led must play it when his turn arrives; and he who asked leave, or *l'hombre* (in England generally called *ombre*), along with him who had the king called, or the *friend*, are from this time partners in the game, and divide either the gains or the losses, as the case may be. The ombre and the friend win the game if they make six tricks between them. This game is complicated by a number of conditions, which, under certain circumstances, modify the ordinary mode of playing.

A modification of this game, under the name of *preferenc*, is much in vogue in Lancashire; and in this country in the beginning of last century, and on the continent—especially in France—the game of *l'hombre*, which is nothing more than quadrille played by three persons, was exceedingly fashionable. *L'hombre* is now quite obsolete, but a most accurate description of the mode in which it was played will be found in Pope's *Rape of the Lock*. *L'hombre* was the immediate predecessor of quadrille in popular favor.

QUADRIVIUM (Lat. *quatuor*, four, and *via*, a road), the name given, in the language of the schools of the west, to the higher course of the mediæval studies, from its consisting of four branches, as the lower course, for an analogous reason, was called trivium (q.v.), or "three roads." The quadrivium consisted of arithmetic, music, geometry, and astronomy. It would carry us beyond our limits to detail the nature and extent of each of these branches as pursued in the mediæval schools. The reader will find much curious and new matter on all questions of this nature in the volumes of the works of Roger Bacon, lately edited in the series issued under authority of the master of the rolls, as also in the introduction prefixed to the volumes.

QUADRUMANA (Lat. four-handed), in the zoological system of Cuvier an order of *mammalia*, which he places next after *bimana* (q.v.), and which contains the animals most nearly resembling man in their form and anatomical characters—viz., the monkey and lemur families. The order quadrumana, with the limits assigned to it by Cuvier, is very generally received by naturalists. The name is derived from a character, in which one most obvious difference from man is, that the extremities of all the four limbs are *hands*, or formed for grasping, and not merely those of the anterior ones: these, indeed, being in many of the monkeys less perfect hands than the hinder ones, through the want or rudimentary character of the thumb. None of the quadrumana are naturally adapted for an erect posture. The differences between man and the apes which most nearly approach him in form, are pointed out in the articles MONKEY, CHIMPANZEE, GORILLA, and ORANG. The quadrumana resemble man in their dentition more than any other animals. Their other digestive organs also exhibit a general similarity to those of man. The similarity is further apparent in the brain and in the reproductive organs; but in the *lemuridae*, a gradual departure from the human form and characters is manifested, with an approach to the ordinary quadruped type.

QUADRUMANA (*ante*). This order comprises the apes, monkeys, baboons, Lemurs, etc., and is characterized as follows: The hallux (innermost toe or thumb of the hind-limb) is separated from the other digits and is opposable to them, making the hind-foot really hands. The pollex (innermost toe or thumb of the fore-limb) may be wanting, but when present is usually opposite the other digits, so that the animal is really quadrumanous, or four-handed. The incisor teeth are generally $\frac{2-2}{2-2}$ and the molars $\frac{3-3}{3-3}$, with broad and tuberculate crowns; clavicles or collar-bones perfect; teats two in number, and (except in *cheiromys*) are situated on the anterior thorax; and the placenta is discoidal and deciduate. They are divided by prof. Owen into three groups, separated from one another by their anatomical characteristics and by their geographical distribution as follows: *Section A*, *strepsirhina*, characterized by the nostrils being curved or twisted,

and by the second digit of the hind-limb having a claw. This section includes the lemurs and a number of allied forms. Madagascar is regarded as its geographical center, but it is found in Africa and in the East Indian archipelago. See AYE-AYE, LEMUR, LEMURIDÆ, LORIS, and NYCTICEBINÆ. *Section B, platyrrhina*, exclusively confined to South America, a chief characteristic being a prehensile tail, adapted to climbing. There are no cheek pouches nor callosities. There is an additional premolar, and sometimes a molar less than in the old-world monkeys. The nostrils are simple, separated by a wide septum, and opening laterally: premolars, $\frac{3-3}{3-3}$; having blunt tubercles.

The pollex is wanting, or, if present, but slightly opposable, though having considerable range of motion. The platyrrhine monkeys are divided into two principal families, *hapalidæ* and *cebidæ*. Family 1, *hapalidæ*, having the same number of teeth as old-world monkeys, but there is one more premolar and one less molar. They are small monkeys about the size of squirrels, and are chiefly found in Brazil. The best-known species is the *marmoset* (q. v.). See also MIDAS. Family 2, *cebidæ*. This contains the typical platyrrhine monkeys, and the dentition differs from that in *hapalidæ* in having an additional molar, so that the molars are the same as in the old-world monkeys, but the premolars are more numerous. Dental formula: $i \frac{2-2}{2-2}$; $c \frac{1-1}{1-1}$; $pm \frac{3-3}{3-3}$; $m \frac{3-3}{3-3} = 36$. There

are no cheek pouches nor callosities; the face is generally more or less uncovered by hair, but sometimes there are whiskers; tail long, generally prehensile. The thumb of the fore-hand is sometimes wanting, but when present is not opposable. All the digits are furnished with flat nails. They live upon fruit and insects. This family contains the spider-monkeys (q. v.), howling monkeys (see HOWLER), sapajou (q. v.). *Section C, catarrhina*.—This is the highest section of the quadrumana, and comprises what are collectively called the old-world monkeys. They have oblique nostrils, placed close together, with a narrow septum, the nostrils looking downward. The thumbs of all the members are opposable, and the animal is therefore strictly quadrumanous. In one genus, the African *colobus*, the pollex is wanting. The dental formula is the same as in

man: $i \frac{2-2}{2-2}$; $c \frac{1-1}{1-1}$; $pm \frac{2-2}{2-2}$; $m \frac{3-3}{3-3} = 32$. The incisors are projecting and promi-

nent, the canines are large and pointed, and are separated by a diastema or interval from the other teeth. The tail is never prehensile, and is sometimes not present. Cheek pouches, opening in the mouth, and serving to hold food, are often present; and the skin covering the prominences of the ischia is generally callous (forming what are called natal callosities), and destitute of hair. With a single exception of a monkey which inhabits the rock of Gibraltar, all the *catarrhina* are natives of Africa and Asia. There are three well-marked groups of the catarrhine monkeys. The first group has a long tail, with generally cheek pouches and natal callosities. It contains the genus *semnopithecus* (q. v.), but which has no cheek pouches. Allied to this is the proboscis-monkey, or kahau. See NASALIS, *ante*. See also MACAQUE and WANDEROO. The second group of catarrhine monkeys comprises the baboon (q. v.); the third group of catarrhine monkeys comprises the anthropoid apes, so named because they appear to make a nearer approach in anatomical structure to man than other monkeys. The members of this group have no tail nor cheek pouches, and some of them no natal callosities. They have a sternum, and are therefore sometimes called *latisternal apes*, and are characterized by the possession of an appendix vermiformis to the cæcum. See ALIMENTARY CANAL, *ante*. The hind limbs are shorter than the fore limbs, and the animal can manage to walk in a semi-erect posture. The canine teeth of the males are long, strong, and pointed; but this is not the case with the females. This group contains the gibbon (q. v.), the orang (q. v.), the genus *troglydytes*, comprising the chimpanzee (q. v.), and the gorilla (q. v.). In regard to the distribution of the quadrumana in time, the earliest representatives of the order are found in the eocene tertiary, in the strata of which in Wyoming territory prof. Marsh has discovered several lemuroids and some nearly related forms. One of the genera of the former, *lemuravus*, has the following dental formula:

$i \frac{3-3}{3-3}$; $c \frac{1-1}{1-1}$; $pm \frac{4-4}{4-4}$; $m \frac{3-3}{3-3} = 44$. The genus *limnotherium*, which shows some affinities with the South American marmosets, has only 40 teeth. The following is the dental formula: $i \frac{2-2}{2-2}$; $c \frac{1-1}{1-1}$; $pm \frac{4-4}{4-4}$; $m \frac{3-3}{3-3} = 40$. "The brain was nearly smooth,

and the cerebellum large, and placed mainly behind the cerebrum. The orbits are open behind, and the lacrymal foramen is outside the orbit" (Marsh). There are also found the remains, in the miocene of North America, of the genus *laopithecus*, which is allied both to *limnotherium* and to some of the South American platyrrhine monkeys. In South America fossils of platyrrhine monkeys have been found in late tertiary or post-tertiary which are referred to existing genera, *cebus* and *iacchus*; also a large fossil belonging to an extinct genus, *protopithecus*, allied to the recent *myeetes*. No fossil platyrrhines have been found in formations older than post-pliocene, nor in any other country in deposits of tertiary age. The earliest traces of catarrhine monkeys appear in the miocene, and as far as known, occur only in the old world, where they are found in the

miocene of France and Italy, as *pliopithecus*, apparently allied to *semnopithecus*. The *dryopithecus* of the miocene of France was a large anthropoid ape, having large, pointed canine teeth, and resembling in many characteristics the gibbons. The *oreopithecus* of the Italian miocene is a catarrhine, with some dental affinities to the primitive ungulates. In the upper miocene of Greece there has been found the remains of an interesting form resembling both the macaques and *semnopithecus*, which has been called *mesopithecus pentelici*. The present Asiatic *semnopithecus* is found in a fossil state in the upper miocene of the Savalik hills of India, in the pliocene of France and Italy, and of the s. of England. The African genus *ceropithecus* has been found in the pliocene of France.

QUADRUPEDS (Lat. four-footed), a term employed both popularly and by scientific writers to designate *four-footed animals*. It is not, however, the name of a class or order in systems of zoology. Popularly, it is almost always limited to those *mammalia* which the *cetacea*, and rarely even to seals or to the *quadrumana* (q.v.). The full development of have four limbs well developed and formed for walking, and is scarcely ever applied to the limbs, with their termination in *feet* properly so called, thus appears to be by 10 means one of the most important characters by which groups of animals are distinguished; and this further appears when the same character is found again, in great perfection, in a lower class of vertebrate animals—in chelonian and saurian reptiles, as tortoises and lizards. But the *four-limbed* type prevails among vertebrate animals, from man downward; so that even in serpents, in which it is least notable, traces of it appear on anatomical examination, as in the case of that class of large serpents named boas (see BOA); and there are many other creatures which form connecting links as to this character between serpents and those reptiles—as crocodiles and lizards—which possess it in greatest perfection. The homology of certain fins of fishes with the limbs of quadrupeds is noticed in the article FISHES. No approach to the four-limbed type is to be found among invertebrate animals.

QUAGGA *Equus*—or *asinus*—*quagga*, an animal of the family *equida* (q.v.), a native of the southern parts of Africa, rather smaller than the zebra (q.v.), with the hinder parts higher and the ears shorter; the head, mane, neck, and shoulders blackish-brown, banded with white; similar bands toward the rump, gradually becoming less distinct; a black line running along the spine. The quagga receives its name from its voice, which somewhat resembles the barking of a dog. It is more easily domesticated than the zebra, and a curriole drawn by quaggas has been seen in Hyde park. In its wild state it does not associate with the zebra, although inhabiting the same plains. Hybrids, or mules, have been produced between the horse and quagga.

·QUAIAUG. See VENERIDÆ.

QUAIL, *Coturnix*, a genus of gallinaceous birds of the family *tetraonida*, nearly allied to partridges, but having a more slender bill, a shorter tail, longer wings, no spur, and no red space above the eye. The first and second quills of the wing are about as long as the third, which is the longest in the more rounded wing of the partridges. Quails, therefore, far excel partridges in their power of flight. The tail is very short. They never perch on trees, but always alight on the ground. They are among the smallest of gallinaceous birds. The common quail (*C. vulgaris* or *C. dactylisonans*) is found in most parts of Europe, Asia, and Africa. In India and other warm countries it is a permanent resident; but in many countries it is a bird of passage; and thus it visits the north of Europe, and at certain seasons appears in vast multitudes on the coasts and islands of the Mediterranean, so that quails are there taken in hundreds of thousands in their northern and southern migrations. The quail is not plentiful at any season in any part of Britain; but sometimes appears even in the northern part of Scotland, and more frequently in the south of England, where it is sometimes seen even in winter. There is reason to believe that the food miraculously supplied to the Israelites in the wilderness was this very species of bird, to which the name *selav*, used in the Mosaic narrative, seems to belong.—The quail is fully seven inches in entire length; of a brown color, streaked with different shades, and the wings mottled with light-brown; the throat white, with dark-brown bands in the male, and a black patch beneath the white, the lower parts yellowish-white. The quail is polygamous. The nest is a mere hole in the ground, with 7 to 12 eggs. The quail is highly esteemed for the table. Great numbers of quails are brought from the continent to the London market.—Other species of quail are found in different parts of Asia, although no other is so abundant as the common quail, and none migrates as it does. The Coromandel quail (*C. textilis*) is a very pretty little bird, rather smaller than the common quail. The Chinese quail (*C. exaltatoria*), a very beautiful little species, only about 4 inches long, is abundant in China, and is there kept for fighting, the males being very pugnacious, like those of other polygamous birds, and much money is lost and won on the combats of these quails. It is also used for a singular purpose—the warming of the hands of its owner.

QUAKERS: the ordinary designation of the society of Friends (q.v.). In respect of law, Quakers differ from the rest of their fellow-citizens chiefly as regards their marriages and their taking of oaths. Thus, though the English marriage acts required all marriages to take place in a consecrated church of the establishment, before the dissenters obtained a relaxation of the law, the Quakers' marriages were excepted, and mar-

riages between two Quakers were allowed to be solemnized according to the usages of their own sect. As regards Quakers in the matter of taking oaths, it is expressly provided by several statutes, that instead of taking an oath in the usual way, they may make an affirmation instead, whether as witness in a court of justice, or as holding a civil office, the qualification for which office is the taking of an oath. The penalties of perjury, however, attach to a false affirmation in the same way as to a false oath. With regard to church-rates, it had been decided that Quakers stand on the same footing as other people in respect of their liability to pay church-rates; but compulsory church-rates are now for the most part abolished.

QUAKING-GRASS, *Briza*, a genus of grasses, having a loose panicle; drooping spikelets, generally remarkable for their broad and compressed form, suspended by most delicate foot-stalks, and tremulous in every breath of wind; the spikelets with two glumes and numerous florets, the florets having each two awnless paleæ, which become incorporated with the seed. The species are few, and mostly European. They are all very beautiful. *B. maxima*, a native of the south of Europe, is often planted in flower-gardens. *B. media*, the only species common in Britain, growing in almost all kinds of poor soil, from the sea-coast to an elevation of 1500 feet, is of some value as a pasture-grass, being very nutritious, although the quantity of herbage is scanty. The value of many poor pastures very much depends on it; but when they are enriched by manures, it generally disappears. It is sometimes sown by farmers, but not nearly to such an extent as it would be if its seed did not lose vitality so quickly that only a small proportion grows, if it is not sown in autumn when newly ripened.

QUAMASH, or BISCUIT ROOT, *Camassia esculenta*, a plant of the natural order *liliaceæ*, nearly allied to squills and hyacinth. It is a North American plant, abounding on the great prairies west of the Mississippi. The roasted bulbs are agreeable and nutritious, and are much used as an article of food.

QUANG-NAM, KUANG-NAM, or TURON, a t. of Anam, about 75 m. s.e. by e. from Hué (q.v.), or Phu-thuan-thien, the capital of Anam. It is situated near the head of a beautiful gulf, and is a place of considerable trade.

QUANG-SEE, or KUANG-SI, a province of China, its name signifying "western-bound." It lies between 22° and 26° n. lat. and 105° and 112° 30' e. long.; 78,260 sq. m.; pop. about 7,000,000. The province adjoins Quang-tong, Hoo-Nan, and Tonquin. The chief river is the Choo-Kiang, which has many branches and lower down is called the Canton. The surface is very mountainous. The chief products are wheat, rice, and cassia. Gold, silver, and baser metals are found, as are also many gems. Capital Kwei-Lin-Foo.

QUANG-TONG, a province of China, bordering on the China sea and the gulf of Tonquin; 70,018 sq. m.; pop. '43, about 20,000,000. The surface is various, mountainous toward the n. of the province. The soil is generally fertile. The country is watered by the Choo-Kiang or Canton river, and some smaller streams. Rice, sugar, indigo, tobacco, cotton, and silk are produced; the minerals are gold, quicksilver, and marble; among the forest trees are oak and rosewood. There are many manufactures, and the trade is extensive. Capital Canton.

QUANTIFICATION OF THE PREDICATE, a phrase belonging to logic, and introduced by sir W. Hamilton to express the characteristic feature of certain logical doctrines of his respecting the proposition and the syllogism.

According to the Aristotelian logic, propositions are divided, according to their *quality*, into affirmative and negative ("the sun has set," "the sun has *not* set"); and, according to their *QUANTITY*, into universal and particular ("all men are mortal," "some men live eighty years"). If we combine the two divisions, we obtain four kinds of propositions—affirmative universal ("all men are mortal"), affirmative particular ("some men live to eighty"), negative universal ("no men are omnipotent"), negative particular ("some men are not wise").

Now, it is remarked by sir W. Hamilton, that the statement of the *QUANTITY* of these various propositions is left incomplete; only the *subject* of each has its quantity expressed (*all men, some men, no men*); while there is implied or understood in every case a certain quantity of the *predicate*. Thus, "all men are mortal," is not fully stated; the meaning is, that all men are a *part* of mortal things, there being (possibly and probably) other mortal things besides men. Let this meaning be expressed, and we have a complete proposition to this effect: "all men are *some* (or part of) mortals," where quantity is assigned, not only to the subject, but also to the predicate. It might be that the predicate contained under it only the subject, as in the proposition: "all matter gravitates." There is no other thing in the universe except matter that obeys the law of gravitation. Knowing this, we might quantify the predicate accordingly: "all matter is *all* gravitating things," a kind of proposition not recognized in the old logic. Another original form of proposition, brought out by supplying the quantity of the predicate, is, "*some* A is *all* B;" "*some* men are *all* Englishmen." So that, instead of two kinds of propositions under affirmation, sir W. Hamilton's system gives four. In the same way, he increases the number of negative propositions. 1. For "no man is omnipotent," he writes, quan-

tifying the predicate, "*any* man is not *any* omnipotent;" or, "*all* men are out of *all* omnipotent things." 2. "Some men are not young" is fully quantified; "some men are not *any* young things;" "some men are out of *all* young things." These two (in their unquantified shape) are the ordinarily recognized propositions of the negative class. To them sir W. Hamilton adds: 3. "*All* men are not *some* animals," "all men are excluded from a certain division of the class animal;" and 4. "*Some* animals are not *some* men;" "a portion of the animals is not included in a portion of men."

The first result, therefore, of completing the statement of a proposition by inserting what Hamilton considers as implied in the thought—namely, the quantity of the predicate—is to give eight kinds of propositions instead of four. The next result is to modify the process called the conversion of propositions. See CONVERSE. The kind of conversion called *limitation* (all A is B, *some* B is A) is resolved into simple conversion, or mere transposition of premises without further change. "All A is *some* B;" "some B is all A."

The multiplication of varieties of propositions is attended with the further consequence of greatly increasing the number of *sylogisms*, or forms of deductive reasoning. See SYLLOGISM. In the scholastic logic, as usually expounded, there are nineteen such forms, distributed under four figures (four in the first, four in the second, six in the third, five in the fourth). By ringing the changes on eight sorts of propositions, instead of the old number, four, *thirty-six* valid syllogisms can be formed in the first figure. Whether the increase serves any practical object, is another question.

Sir W. Hamilton also considers that he has been led, by the new system, to a simplification of the fundamental laws of the syllogism, or, as he expresses it, "the reduction of all the *general laws of categorical syllogisms* to a *single canon*."

Professor De Morgan, in his elaborate system of *Formal Logic*, has also invented and carried out into great detail a plan of expressing the quantity of the predicate; but he does not admit the whole of Hamilton's eight propositional forms, rejecting in particular the last-mentioned in the above enumeration. He also increases the number of valid syllogisms as compared with the old logic. Not content with indicating that the predicate has quantity as well as the subject, he supposes the possibility of a *numerical estimate* of quantity in both terms of the proposition, and from this draws a new set of inferences. Thus, if 60 per cent of B are included in C, and 70 per cent in A, 30 per cent at least of B must be found both in A and in C.—See sir W. Hamilton's *Discussions*; Spencer Baynes's *New Analytic of Logical Forms*; De Morgan's *Formal Logic*; Mill's *Logic*, under the syllogism; and his *Examination of Sir W. Hamilton's Philosophy*.

QUAQUAVERSAL (Lat. turning every way), a term applied in geology to the dip of the stratified rocks when arranged in dome-shaped elevations, or basin-shaped depressions whereby the beds have an inclination on all sides to one point, that point being the summit of the dome in the one case, and the lowest level of the basin in the other.

QUARANTINE (from the Fr. *quarantaine*, a period of 40 days) is a forced abstinence from communication with the shore, which ships are compelled to undergo when they are last from some port or country where certain diseases held to be infectious, as yellow fever, plague, or cholera, are or have been raging. Where a quarantine is established, it is a high misdemeanor for any person in the suspected ship to come on shore, or for any one to disembark any merchandise or goods from her. The countries on the eastern and southern shores of the Mediterranean are those most commonly held to be infectious, and, as a regular arrangement, ships from them have to pass quarantine at Malta, or some French, Italian, or Spanish port. In England, the quarantine laws were, until about 20 years ago, enforced with severity; but now a quarantine is an unusual occurrence, although the power to enact it rests with the crown, and it is occasionally imposed by an order in council. In Mediterranean ports, quarantine ordinarily lasts from 6 to 15 days, though it sometimes extends to a much longer period, during which the passengers are imprisoned in a sort of barrack called a "lazaretto," and the contents of the ship—animals, goods, and letters—are fumigated, punctured, sometimes immersed in water, or even acid, and all possible means are adopted to destroy infection.

Quarantine is not of necessity limited to a sea-frontier; and it is enforced—often with absurd rigor—at the frontiers between contiguous states, especially in eastern Europe, to the annoyance of travelers, and to the serious detriment of commerce.

History declares quarantine regulations for maritime intercourse to have been first established by the Venetians in 1127 A.D.: but the practice must have been greatly older on land frontiers; and the precautions of the Jews against leprosy indicate that a species of quarantine was enforced by them. The law for regulating quarantine, when imposed in England, is 6 Geo. IV. c. 78.

QUA'RÉ IMPEDIT is the title of an English acion, whereby a person who has purchased an advowson, or right of presentation to an ecclesiastical benefice, sues any one who disturbs or hinders him in the exercise of his legal right.

QUARLES, FRANCIS, 1592-1644; b. in Essex, England. His career was an active and varied one, in curious contrast with the recluse character of his verse. He was in Bohemia as part of the retinue of the queen—Elizabeth, daughter of James I.; afterward in Dublin as secretary to archbishop Usher; was driven out of Ireland by the

rebellion of 1641, and fled to London, where he was appointed chronologer of the city. Having espoused the cause of Charles I. and defended it in print, he was roughly handled by the Puritan party, and his books and MSS. were confiscated. His death in the same year (1644) is attributed to chagrin at the treatment which he had received. His best-known works are: *A Feast for Worms* (1620); *Argalus and Parthenia* (1621); *Job Militant* (1624); *Enchiridion* (1652); and especially the *Emblems, Divine and Moral* (1635), which has passed through numerous editions, and is still popular.

QUARREL, or **QUARRY**, a pane of glass of a lozenge or diamond shape. The name is also applied to a perforation or window of this form, and to square or diamond-shaped paving-stones or tiles.

QUARRY (Fr. *carrière*). When any useful rock is worked in an open manner at the surface of the earth, the excavation is called a quarry. Quarrying differs little from mining in principle, except that the latter is essentially an underground operation.

From a very remote period, famous granite quarries have been worked at Syene, and others of sandstone and limestone, along the banks of the Nile, for the temples and monuments of ancient Egypt. Greece found the materials for her white marble temples in the quarries of mount Pentelics, near Athens, and in those of the islands of the archipelago. It was from the quarries of travertine (a kind of limestone), at Tibur, that ancient Rome was chiefly built. Italy has long been celebrated for her marble quarries, those of Tuscany yielding the most esteemed kinds. The fine saccharoid marbles for statuary and other fine-art purposes are exclusively obtained from the Apuan Alps, which rise around Carrara, Massa, and Seravezza. Those of Carrara, especially, are highly prized all over the world. From the quarries at Seravezza, marble to the value of £150,000 has been taken for the splendid cathedral of St. Isaac at St. Petersburg alone.

Of the more celebrated quarries of the British islands, we may mention those of Cornwall, Aberdeen, and Wicklow for granite; those in the neighborhood of Edinburgh, Glasgow, and Newcastle for sandstone; those near Bristol and Doncaster, and in the isle of Portland, for limestone; those of Derbyshire, Devonshire, Kilkenny, and Galway for marbles; and those of north Wales and Argyleshire for slates.

To understand the operations of the quarryman, it is necessary to bear in mind that all rocks belong to one or other of two great classes, namely, the stratified and the unstratified. The former are sedimentary rocks, occurring in parallel beds or strata, and consist chiefly, in so far as we are at present concerned, of sandstone and limestone. Unstratified or igneous rocks, which include greenstone or whinstone, granite, porphyry, etc., have no distinct bedding, that is, they do not lie in separate layers. Roofing-slate is a stratified rock, but it splits into thinner laminæ in the direction of its *cleavage* than in the direction of its bedding, the former being often at right angles to the latter. Granite and other igneous rocks have also a natural jointage or cleavage, although they are not stratified. Advantage is taken of these peculiarities in quarrying the different rocks, but in the main the systems adopted do not greatly differ.

Stones are most frequently separated from their native rock by blasting with gunpowder. This operation is described in detail under **BLASTING**; see also **GALVANISM** and **SAFETY-FUSE**. Of late the practice of boring jumper-holes with engine-power has been introduced, and wherever it can be conveniently applied, must be a great improvement on the slow and tedious process of boring by hand. See **TUNNEL**.

With some stratified rocks, such as sandstone, a good many of the best stones are procured without the aid of gunpowder. Hand-tools are alone used, because blasting is apt to cause rents, and otherwise shatter portions which it is desirable to keep solid. By this method, the quarryman makes a number of small holes with a pick, along a certain length of rock, into which steel wedges are inserted. After a succession of blows with heavy hammers, the wedges at length cut through the stratum. Blocks for columns, obelisks, tombstones, etc., are best procured in this way. It may also be stated that these are obtained from those more valuable parts of sandstone deposits technically termed "liver rock;" which consist of the thicker and more consolidated strata. Flagstones and other pieces of limited thickness are quarried from the thinner beds termed "bed rock."

When stones are removed in masses by blasting or otherwise, they have still to be quarried into shape, according to the purpose for which the various pieces are best suited. Thus, in an ordinary building-stone quarry, the larger stones (after those of unusual size and quality are selected for the purposes named above) are roughly formed into ashlar; window-sills, lintels, rybats, corners, steps, and the like, by means of such tools as picks, hammers of various kinds, and wedges. The small irregular-shaped pieces are called *rubble*, and are used for the commonest kind of building. Slates are split up into the thickness used for roofing, by means of a mallet and broad chisel. In granite quarries worked for paving-stones, as has been incidentally alluded to above, the loss of material in reducing the blocks to the size and shape required, is enormous, as much as four-fifths of the whole being commonly wasted. Besides the tools already mentioned, long iron bars called *pinches*, and powerful cranes for turning and lifting the larger stones, are nearly all the implements required by the quarry-master.

In quarrying, as well as in mining, much of the cost is incurred for the pumping of

water from the workings. A good steam-engine and set of pumps are, therefore, indispensable for every quarry of any extent. Much expense is also every now and then incurred in clearing away sand, gravel, and other loose débris from the upper bed of the rock. This, which is called "drift" by geologists, and "tiring" in some localities by quarrymen, often becomes suddenly very deep, especially where the beds dip at a high angle, and is an obstacle by which many quarries of stratified rock are sooner or later arrested.

QUARRIES, in point of law, belong to the person who is owner of the freehold or inheritance of the land, the maxim being that the owner is entitled to the soil down to the center of the earth. No person, therefore, is entitled to work a quarry or carry away the materials unless he derives his right from the owner by lease or other legal title, for the stones or materials are part of the soil, and belong to the freeholder.

QUART, a measure of capacity, and the fourth part of a gallon (q.v.). The word is nothing more than the common word "quarter," a fourth part. The ordinary *quart-bottle* is a deception, containing only the sixth part of a gallon, and often less.

QUARTAN FEVER. See AGUE.

QUARTER, the name of two measures in use throughout the United Kingdom, one of them a measure of weight, and the other of capacity. The former is denominated a quarter from its being the fourth part of a hundredweight, and contains 28 lbs. avoirdupois; the capacity measure of the same name is said by some to have been so called from its being the fourth part of a "chaldron," but, as it happens, the quarter does not always bear this relation to the chaldron. As the porphyry coffer in the king's chamber of the great pyramid (see PYRAMID) is said to be almost accurately the quadruple of the English quarter, the bold theory has been advanced that this is the origin of the measure and the name (see *Our Inheritance in the Great Pyramid*, by Piazzzi Smyth). The quarter contains 8 bushels, of 4 pecks each. See BUSHEL.

QUARTER, in heraldry, a subsidiary consisting of the upper dexter fourth part of the shield, cut off by a vertical and a horizontal line meeting in the center of the shield. When two or more coats are marshaled together on a shield divided into squares for their reception, such divisions are also called quarters. See QUARTERING.

QUARTER, in war, signifies the sparing of the life of a vanquished enemy, which by the laws of war is forfeit to the victor. The expression seems to be derived from the use of the word "quarter" to designate the lodging of a particular warrior; to *give quarter* to a prisoner being to send him to his captor's quarter for liberation, ransom, or slavery. The refusal of quarter is a terrible aggravation of the horrors of war, and is only at all justifiable toward an enemy who has been guilty of atrocious cruelty himself or of some flagrant breach of faith.

On shipboard, a quarter is the stern portion of each of the ship's sides. The extent of the quarter is arbitrary, but it is generally held to comprise about one-fifth of the ship's length.

QUARTER-DAYS are the days adopted between landlord and tenant for entering or quitting lands or houses and for paying rent. The origin of these periods is no doubt due entirely to convenience, and though in England they are unknown to the common law, yet now they are almost part and parcel of every agreement made between parties as to the letting of houses and land. In England, if nothing is said as to the time of payment of rent, it is due only once a year, and the first payment is due at the end of a year from the time of entry. But, owing to the convenience of the usual quarter-days, they are commonly referred to, and thereby imported into the contract. Thus, it is usual to enter and leave houses either at one of the four ordinary quarter-days, or where it is so arranged at half-quarter-days, and these points of time are fixed upon for the convenience of calculating rent. Rent of houses is generally made payable quarterly on the usual quarter-days. These are, in England and Ireland, Lady day, Mar. 25; Midsummer day, June 24; Michaelmas day, Sept. 29; and Christmas day, Dec. 25. In Scotland, there are what are called two legal terms in each year, and two conventional terms, the latter being only adopted when expressly so agreed. The legal terms are Whitsunday, May 15, and Martinmas, Nov. 11; and the conventional terms are Candlemas, Feb. 2, and Lammas, Aug. 1. The law of Scotland differs from that of England in this, that if nothing is said between the parties on letting houses and lands, these legal terms are impliedly included as part of the agreement, both as regards time of entry and payment of rent. Thus, as to houses and grass-lands, the legal term of the entry is Whitsunday, and that of entry to arable land is Martinmas. So the rent is presumed to be payable twice a year at those legal terms, if nothing is said to the contrary.

QUARTER-DECK of a ship is an upper deck extending from the main-mast to the poop, or, when there is no poop, from the main-mast to the stern. It is used as a promenade by the officers only, and, in a ship-of-war, no person—officer or otherwise—enters upon it without touching his hat in token of salute. When the capt. addresses his men, or confers public distinction on any individual, the crew are summoned aft on the quarter-deck.

QUARTERING, in heraldry, is the bearing of two or more coats on a shield divided by horizontal and perpendicular lines, a practice not to be found in the earlier heraldry, and little in use till the 15th century. Arms may be quartered for various reasons. 1. To indicate dominion. A sovereign quarters the ensigns of his different states. The earliest instance of quartering in England is found in the paternal arms of Eleanor, daughter of Frederick III., king of Castile and Leon, and first wife of Edward I., as represented on her tomb in Westminster Abbey—the castle of Castile occupying the first and fourth quarters, and the lion of Leon the second and third. The arms of England and Ponthieu are similarly quartered on the same monument, and on the crosses erected to queen Eleanor's memory. The received rule regarding the quartering of the ensigns of different states is, that precedence is given to the most ancient, unless it be inferior in importance. Feudal arms are sometimes quartered in the same way by subjects. 2. Arms of augmentation or special concession accorded to a subject by his sovereign, by way of honor, are sometimes granted to be borne quarterly with the paternal arms. These generally contain a portion of the royal insignia, and have precedence of the paternal coat. 3. The most usual reason for quartering is to indicate descent from an heiress who has intermarried into the family. Where there is but one heiress, her coat occupies the second and third quarter of the shield, and the paternal arms the first and fourth. Where there are more than one, they are marshaled in the successive quarters in the order of the intermarriages. Where more than four coats have to be marshaled, the number of vertical lines is increased, and the divisions, though more than four, are still called quarters. Where there is an odd number of coats, the last quarter is usually filled up by repeating the first. One of the quarters may itself be quartered, when the heiress was entitled to bear a quartered coat; the shield is then said to be counter-quartered, and its primary quarters are called *grand quarters*. Quarterings are not allowed to be added to the paternal coat without the sanction of the heraldic authorities.

The expression "quarterings" is often loosely used for *descents* in cases where there is no right to quarter from representation. The eight or sixteen quarterings which are sometimes ranged round the Scottish funeral escutcheon, and which are still important for many purposes in Germany, have no reference to representation, but imply purity of blood for four or five generations; i.e., that the father and mother, the two grandmothers, and four great-grandmothers, as also in the case of sixteen quarterings, the eight great-great-grandmothers, have all been entitled to coat-armor.

QUARTERMASTER. In the army, the *quartermaster-general* is a staff officer of high rank, whose duty it is to arrange the marches, quarters, and internal arrangements of the army to which he belongs. Every army has some officer of this department; from a brigade with a deputy-assistant-quartermaster-general, receiving £173 7s. 6d. a year besides regimental pay, up to a complete army under a commander-in-chief, with a quartermaster-general, who is usually a general officer, and receives £691 19s. 7d. per annum, besides his other pay. At headquarters there is a permanent quartermaster-general, responsible for all the movements of the army, the organization of expeditions, camps of instruction, etc. He receives £1500, besides his pay as a general officer, and has a sub-department at the war-office, with clerks, etc. He is under the officer commanding in chief, and the adjutant-general. The *quartermaster* is an officer on the staff of each regiment, in which he holds the relative rank of lieutenant. His duties are to superintend, assign to their respective occupants, and have charge of, quarters, barracks, tents, clothing, etc., used by the regiment. He is also regimental storekeeper. He rises, with scarcely an exception, from the ranks, the experience of an old sergeant being considered highly useful in the office. The quartermaster has no further promotion to look forward to; but after 30 years' service in all—including 10 as an officer—he may retire with the honorary rank of captain. He receives 10s. 2d. a day in the cavalry, and 8s. 2d. in the infantry, rising by length of service to 15s. 2d. and 13s. 2d.; with slightly different rates in the guards, engineers, etc. He is not required to join the mess. The *quartermaster-sergeant* is a non-commissioned officer appointed to assist the quartermaster in his various duties. He receives daily 4s. 5d. in the cavalry, 4s. in the artillery, 2s. 11d. in the infantry of the line.

In the navy, the *quartermasters* are certain petty officers appointed in each ship by the captain to have charge of the stowage of ballast and provisions, of coiling ropes, attending to the steering, keeping time by the sand-glasses, etc. The principal of these men is called the ship's quartermaster, and receives £41 1s. 3d. per annum, if engaged for continuous service; £36 10s. if otherwise.

QUARTERMASTER (*ante*), in the U. S. army, is a regimental officer with rank of lieutenant, assisted by a quartermaster-sergeant. The organization of the quartermaster's department of the regular army now includes a quartermaster-gen. with rank of brigadier-gen.; 4 assistant quartermaster-gens. with rank of colonel; 8 deputy-quartermaster-gens. with rank of lieutenant-colonel; 14 quartermasters with rank of major; and 30 assistant-quartermasters with rank of captain. The general duties of the department are to furnish food, forage, ammunition, clothes, and fuel; to purchase horses, wagons, tents, ambulances, and equipage; to provide transportation; and to see that railroads, telegraphs, bridges, and roads are in order.

QUARTERN is a term frequently employed in some parts of Great Britain to designate the fourth part of a peck; and in liquid measure, it is the fourth part of a pint, and is synonymous with the imperial gill.

QUATERNARY, a term employed by some French and English geologists to characterize the post-tertiary strata, which they group together into an epoch of equal value with the three great divisions of primary, secondary, and tertiary. The deposits included under the name will be found described under the pleistocene and recent strata, to which we refer the reader.

QUATERNIONS, the name given by its inventor, sir W. R. Hamilton (q. v.), to one of the most remarkable of the mathematical methods or calculi, which have so enormously extended the range of analysis, while simplifying its application to the most formidable problems in geometry and physics.

It would be inconsistent with our plan to give even a complete though elementary analytical view of this calculus; but it is possible, by means of elementary geometry and algebra alone, to give the reader a notion of its nature and value.

For this purpose, it will be necessary to consider some very simple, but important, ideas with reference to the *relative position* of points in space. Suppose A and B to be any two stations, one, for instance, at the top of a mountain, the other at the bottom of a coal-pit. *Upon how many distinct numbers does their relative position depend?* This can be easily answered, thus: B is so many degrees of longitude to the e. or w. of A, so many degrees of latitude to the n. or s. of A, and so many ft. above or below the level of A. **THREE** numbers suffice, according to this mode of viewing the question, to determine the position of B when that of A is given. Looking at it from another point of view, suppose A to be the earth, B a fixed star. To point a telescope at B, we require to know its altitude and azimuth, its latitude and longitude, or its right ascension and declination. Any of these pairs of numbers will give us the *direction* of the line AB, but to determine absolutely the position of B, we require a *third* number—viz., the length of AB. Hence, it appears that any given line AB, of definite length and direction, is completely determined by *three* numbers. Also, if the line *ab* be parallel and equal to AB, it evidently depends on the same three numbers. Hence, if we take the expression (AB) to denote (*not*, as in geometry, the length of AB merely, but) the length and direction of AB; we see that there will be no error introduced, if we use it in the following sense:

$$A + (AB) = B;$$

i. e., if, beginning with A, we take the step represented by (AB), we shall find ourselves at B. From this it follows at once that, if C be any third point,

$$A + (AB) + (BC) = C;$$

i. e., beginning at A, and taking the successive steps (AB) and (BC), we are finally brought to C. But we have also

$$A + (AC) = C,$$

by taking the step from A to C at once. Hence, with the present signification of (AB), etc., we see that

$$(AB) + (BC) = (AC),$$

which shows that lines, *when their length and direction are both considered*, are to be added or compounded according to the same law as velocities or forces. See **COMPOSITION OF FORCES**. In this sense, a line is called by sir W. R. Hamilton a *vector*.

Again, we have evidently

$$A + (AB) + (BC) + (CA) = A,$$

because the three successive steps bring us back to the starting-point. Hence

$$(AB) + (BC) = -(CA),$$

and therefore (AC) = -(CA), or the sign (only) of a vector is changed if its direction be reversed.

The rules for the addition, and, therefore, for the subtraction, of vectors are thus extremely simple; and, without any further preface, we are in a position to solve a great many geometrical problems, some of which are of no common difficulty. A comparatively simple one must suffice; let us prove Euclid i. 33; i. e., if AB be parallel and equal to CD, AC is parallel and equal to BD. In vectors, given (AB) = (CD), prove (AC) = (BD). We have at once, by going directly from A to C, and then by the course A, B, D, C,

$$(AC) = (AB) + (BD) + (DC).$$

But (AB) = (CD) = -(DC) by what we have just proved. Hence the first and third terms of the expression for (AC) are equal and of opposite signs, and therefore

$$(AC) = (BD).$$

This example has been chosen from its simplicity, and gives an extremely inadequate idea of the grasp which vectors take in common geometry.

So far, we have not advanced much beyond common geometrical methods; but we now come to the step in which quaternions proper are introduced, a vector being merely a degraded species of quaternion. This new step contains Hamilton's answer to the question, answered over and over again during the last 50 years in forms of the most uncounted complexity, "*How to express the product, or the quotient, of two vectors, or directed lines.*" In other words, keeping to one part of the question only, what is the nature of the factor q in the equation

$$(AC) = q(AB),$$

where A, B, C are any three points?

Let us first consider on how many independent numbers does it depend? It might at first sight appear to depend on six, for (AB) and (AC), as we have already seen, each contain three. But let us analyze the process of passing from the one vector to the other, much as we have already analyzed the vector step of passing from one point to another. To simplify the idea of the process, let us suppose it to be effected by a species of rotation.

First, then, in order that (AB) may be turned so as to coincide in direction with (AC), it must be turned about an axis perpendicular to the plane of the triangle ABC, and through an angle BAC. Now, the direction of a line depends on two numbers, as we have seen above; hence, we have two for the direction of the axis, and one for the angle through which AB is turned. But AB and AC are not, in general, of equal length; hence, after their directions have by turning been made coincident, AB must be compressed or stretched till its length is the same as that of AC. Thus, a fourth number is required for the complete description of the process, and, therefore, q depends upon four independent numerical quantities; hence its name, quaternion. A similar investigation, but somewhat less elementary, shows that the product of two vectors also depends on four distinct numbers. This will be proved analytically further on in the article.

Now, suppose AB and AC to be equal to each other, and at right angles; and suppose

$$q(AB) = (AC);$$

i. e., suppose that q turns AB through a right angle in a given plane, without altering its length. Apply the operation denoted by q , a second time, and we have

$$q \cdot q \cdot (AB) = q(AC).$$

Now $q(AC)$ must represent a vector equal to AC in length, but turned through a right angle, in the plane BAC. It must therefore be in the direction of BA produced through A, and equal in length to AB. Hence, by a previous remark, it may be expressed by

$$-(AB), \text{ or by } (BA).$$

Hence, $q \cdot q(AB) = -(AB)$, or $q \cdot q = -1$.

The particular quaternion, therefore, which turns a vector through 90° without altering its length, has its square equal to -1 . Though, of course, they are essentially a real geometrical conception, this result shows how closely quaternions are connected with what are called imaginary quantities (q. v.) in analytical geometry and algebra.

Now, it is found, by a careful examination of all the consequences involved, that we are at liberty to represent by a vector of unit length, perpendicular to the plane of two equal lines at right angles to each other, the quaternion which, employed as a multiplier, changes one of these lines into the other. This result we must assume; as its proof, though not in any sense difficult, would require the free use of analytical symbols to condense it within our assigned limits. Hence, three vectors, each of unit length, and each perpendicular to the other two, have the property that the product of any two, taken in the proper order, is the third. For illustration, suppose these to be drawn eastward, northward, and upward, and let them be represented (according to Hamilton's notation) by i, j, k , respectively; we have the following equations among them:

$$i \cdot j = k, j \cdot k = i, k \cdot i = j;$$

where it is to be observed that the order of the alphabet is maintained throughout. Also, as before, we see that $i^2 = j^2 = k^2 = -1$.

Considering them for a moment as handles to be laid hold of to turn the whole system about one of them, we see that i turns j into the position of k ; that is, the operation i may be effected by a lefthanded quadrantal rotation about the eastward line i . What, then, is the result upon the vector i of the rotation symbolized by j ? Laying hold of the northward line j , use it as an axis of left-handed quadrantal rotation, and the effect on the system will be not only (as above, $jk = i$) to make the upward line an eastward one, but to make the eastward line a downward one; in symbols,

$$j \cdot i = -k.$$

Comparing this with

$$i \cdot j = k,$$

we see that in quaternions, *the commutative law of multiplication does not hold*; i. e., that the product depends not only on the factors, as in arithmetic and algebra, but upon the order in which the multiplication is effected. This is, of course, a little perplexing to the beginner, but is easily got over; and the mere consideration of this fact is often sufficient for the proof of theorems regarded in general as of no ordinary difficulty.

For further information, we must refer the reader to sir W. R. Hamilton's *Lectures on Quaternions*, and to his *Elements of Quaternions*. Some elementary information may also be derived from papers by Kelland and Tait in the *Quarterly Messenger of Mathematics*, and the *Quarterly Mathematical Journal*. The subject is yet in its infancy, but even now its power is herculean, and its extreme simplicity and generality recommend it to all who are desirous of extending the effective range of mathematical analysis.

QUARTERS, in naval and military affairs, are generally the positions assigned to persons or bodies of men. In a more special sense, the quarters in the army are the places of lodging assigned to officers or men, when not actually on duty. *Headquarters* is the quarter of the commanding officer of a force, or of a section of a force. The headquarters of the whole British army is at the horse-guards, where the commander-in-chief has his permanent offices.

In the *navy*, quarters has the special meaning of the positions to be taken by every man in actual combat.

QUARTERS, the upright posts of timber-partitions, etc., used for lathing upon. They do not exceed 4 in. square, and are generally about $4\frac{1}{2}$ in. by 2 in., and are placed from 12 to 14 in. apart.

QUARTER-SESSIONS, in England, is a court or meeting of justices of the peace, who assemble every quarter of the year, for judicial as well as miscellaneous business. The meetings are fixed by statute to be held in the first full week after Dec. 28, Mar. 31, June 24, and Oct. 11, respectively; often otherwise called the Epiphany, Easter, Trinity, and Michaelmas sessions. The chief officer of the court of quarter-sessions is the *custos rotulorum*, so called because he is intrusted with the custody of the records and rolls. He is always one of the justices of the peace of the county or riding, nominated by the crown, and appointed by the commission. His deputy is the clerk of the peace, who acts also as clerk to the court of quarter-sessions. The jurisdiction of the court of quarter-sessions is confined to criminal business, and is very important. It includes all criminal offenses whatever, except the highest classes; thus, it has no jurisdiction to try for treason, murder, or capital felony, or blasphemy, perjury, forgery, arson, bigamy, abduction of women or girls, concealment of birth, offenses against the queen's title or the bankrupt laws, bribery, blasphemous, seditious, or defamatory libels, unlawful combinations or conspiracies, stealing or destroying wills or records. Besides its jurisdiction in criminal offenses, there are numerous miscellaneous matters of which the court has cognizance, including appeals from petty sessions, and from justices in special sessions, on a great variety of subjects as to convictions of vagrants, stopping up highways, removal of paupers, etc. The justices who do the work of quarter-sessions are all unpaid, and thus save the country much expense. They generally choose a chairman of their own body to preside regularly at these courts, which office is considered a great honor, and is generally given to an able practical man, well versed in business.

This plan, however, of unpaid judges has been found inexpedient in boroughs and large towns, where the justices of the peace being appointed chiefly from successful tradesmen, are not possessed of the necessary education to secure the efficient performance of like duties. There is therefore appointed for every borough in England a recorder, who is a barrister, appointed by the home secretary, and is paid by salary out of the borough fund—a salary, however, very trifling in amount. His duty is confined to trying prisoners and other judicial business, and he is in fact, in his own person, the court of quarter-sessions for boroughs. There is also an exception to unpaid judges of quarter sessions in the county of Middlesex, where a barrister is appointed to act in the trial of prisoners, and called the assistant judge, being the official chairman of the Middlesex sessions. The routine of business at quarter-sessions consists of the trial of offenders, the trial of appeals, and the hearing of motions upon different subjects. Sometimes a second court sits, consisting of some of the justices appointed by the whole court, whenever the business is unusually heavy. In Scotland there is also a court of quarter-sessions of the peace, held four times a year at the county town—viz., on the first Tuesdays in May, August, and March, and the last Tuesday in October. At these courts, the justices have power to review the sentences of special and petty sessions. But these courts are of a trifling description compared to the courts of the same name in England. In Scotland, the judicial business which in England devolves on courts of quarter-sessions, is chiefly disposed of by the sheriff of the county.

QUARTER-STAFF, formerly a favorite weapon with the English for hand-to-hand encounters, was a stout pole of heavy wood, about $6\frac{1}{2}$ ft. long, shod with iron at both ends. It was grasped in the middle by one hand, and the attack was made by giving it a rapid circular motion, which brought the loaded ends on the adversary at unexpected points.

QUARTET, a piece of music arranged for four voices or instruments, in which all the parts are *obligati*, i. e., no one can be omitted without injuring the proper effect of the

composition. Vocal quartets are generally accompanied by instruments to sustain the voices. A mere interchange of melody, by which the parts become in turn principal and subordinate, without any interweaving of them, does not constitute a quartet. Quartets for stringed instruments are generally arranged for two violins, a tenor violin, and violoncello. The important quartets have been composed by Haydn, Mozart, Beethoven, Spohr, and Onslow.

QUAR TILE. See ASPECTS.

QUARTO-DE-CIMANS, those who, after the final decision of the council of Nicæa, continued to hold that it was obligatory on Christians to celebrate Easter on the 14th day of the first lunar month near the vernal equinox, *whether that 14th day fell on Sunday or not*, or who, even before the council of Nicæa, held the observance of the Jewish Pass-over to be of obligation. The controversies as to the celebration of Easter have been briefly described under the head Easter (q. v.).

QUARTZ, a mineral, which is essentially *silicic acid*, or *oxide of silicon* (see SILICON), although it is often combined or mixed with other substances. It is a very abundant and widely diffused mineral. It is almost the sole constituent of quartz rock, in which gold is far more frequently found than in any other matrix; and it is a principal constituent of granite, svenite, protogine, eurite, pegmatite, granulite, elvanite, all the different kinds of sandstone, and many other rocks. It is also a common mineral in trap-rocks, limestone, etc., and the sands of the sea-shore and of deserts are chiefly formed of it. It is found both massive and crystallized; the primary form of the crystals is a rhomboid, but it far more frequently occurs in six-sided prisms, terminated by six-sided pyramids; or in six-sided pyramids; or sometimes in dodecahedrons, formed by six-sided pyramids base to base. It is hard enough to scratch glass easily, and it gives fire with steel. It becomes positively electrical by friction; and two pieces, rubbed together, give light in the dark. When pure it is quite colorless; but, owing to the presence of foreign substances, it often exhibits great variety of colors; and many minerals, known by different names, and consisting chiefly of quartz, have little or nothing to distinguish them but their color. Thus rock crystal, chalcodony, carnelian, cairngorm, agate, amethyst, prase, chrysoprase, jasper, etc., are mere varieties of quartz. Opal (q. v.) is very nearly allied to it.

Quartz rock, or *quartzite*, is a sedimentary sandstone, converted into a very hard compact rock by metamorphic action. It is distinctly granular; the grains, however, seem to melt into each other, or to be enveloped in a homogeneous silicious paste. It is frequently brittle, and in weathering, it breaks up into small irregular cubes.

Quartz veins occur in metamorphic rocks. The structure of the veins is compact and homogeneous, and very different from that of quartzite. Veins not only differ in width, but the same vein is very variable throughout its course, sometimes thinning to a very fine film, and then swelling out to great thicknesses. Quartz veins are more metalliferous than the mass of the rocks in which they occur. They are the principal natural repositories of gold, for though the precious metal is chiefly obtained from alluvial sands and gravels, these are the weathered and abraded fragments of the under-lying, or neighboring palæozoic rocks. Small quantities of gold have been found in the quartz veins traversing the Silurian and Cambrian rocks of Wales and Scotland; and in Victoria the great veins are so highly auriferous, that they are mined for the precious metal. Wherever the lower Silurian rocks make their appearance on the surface throughout the colony, they are everywhere intersected by enormous numbers of quartz veins, which often reach a thickness of 10 to 15 feet. As yet only a very small proportion of these have been explored; but the results have been so remunerative, that mining in the solid rock for gold is extensively pursued. One mine has been driven to a depth of 400 ft., and, contrary to the generally-received opinion, the vein at this depth continued to be auriferous.

QUASIMODO SUNDAY, called also **DOMINICA IN ALBIS** the first Sunday after Easter. The name Quasimodo Sunday is taken from the first words of the Introit (1 Peter ii. 2) of the mass of the day. The name *Dominica in Albis* is derived from the custom which was formerly observed of the neophytes who had been baptized at Easter appearing in white garments in the church.

QUASS, a sort of weak beer produced in Russia by fermenting rye-meal in warm water. It is usually bottled in stone bottles, and is a favorite beverage with the people generally. When it becomes too sour it is used as vinegar.

QUASSIA, a genus of trees and shrubs of the natural order *simarubaceæ* (q. v.); having hermaphrodite flowers, with five petals combined into a tube, and much longer than the small calyx, ten stamens, five germens, and only one style; the fruit composed of five drupes. *Quassia amara* is a native of the tropical parts of America, and of some of the West India islands. It is a shrub of 10 to 15 ft. high, with racemes of bright-red flowers, and large pinnate leaves, the stalks of which are remarkably winged and jointed. The wood, and particularly that of the root, has a very strong, bitter taste, and was at one time much used in medicine under the names of *quassia-wood*, *bitterwood*, etc. The flowers were valued in Surinam for their stomachic properties, as early as the beginning of the 18th c.; the wood of the root began to be known in Europe before the middle of that century, and was more fully brought into notice about 1756, by Rolander, a Swede,

who had visited Surinam, and had learned its value from a negro called Quassi, or Quasha. This negro had employed it with great success as a remedy for fevers, and although, as Rolander says, a very simple man, had acquired a great reputation by his use of it. Linnæus published a dissertation on it in 1763, and it was he who gave to the genus the name quassia, from the name of the slave by whom its medicinal qualities had been made known. The true quassia is now, however, little used; its name having been transferred to the bitterwood (q.v.) of the West Indies, *picærna* (or *simaruba*) *excelsa*, a lofty tree, the wood of which possesses the same properties, although in an inferior degree; but this inferiority is compensated by the greater facility with which any requisite supply is obtained. It is the wood of this tree which is now sold as *quassia-wood*, or *quassia-chips*, in the shops. It is used to a considerable extent instead of hops for making beer, although the use of it is illegal in Britain, and beer made with it is said to become muddy and flat, and not to keep. Quassia-wood is narcotic, and a decoction of it is used for killing flies. Cabinet-work made of it is safe from all attacks of insects. In medicine, it is a valuable tonic; but in fevers, it is not to be compared with Peruvian bark and its alkaloids. Its properties depend chiefly on a bitter principle called *quassite* or *quassin*.

QUA TRAIN (Fr. *quatre*, four) is the name given (originally by the French) to a little poem of four verses (lines) rhyming alternately, or even sometimes to four verses of a longer poem, such as a sonnet, if they form a complete idea within themselves. Epigrams, epitaphs, proverbs, etc., are often expressed in quatrains.

QUATRE-BRAS (Four Arms), a village of Belgium, province of S. Brabant, about 10 m. s.e. of Waterloo. It is situated at the intersection of the great roads from Brussels to Charleroi, and from Nivelles to Namur, whence its name. On June 16, 1815—two days before the battle of Waterloo, Quatre-Bras was the scene of a desperate and sanguinary battle between the English under Wellington and the French under Ney. The honors of the field remained with the former; but the severe defeat of Blücher the same day at Ligny rendered Wellington's hard-won victory almost valueless; and foreseeing that it would be impossible for him to maintain his position, the English commander retired next morning through Jemappes to Waterloo, in order to keep up his communication with the Prussian army. The loss of the English and their allies at Quatre-Bras was in all 5,200: that of the French, though beaten, amounted only to 4,140. This is to be accounted for by the fact that, during the greater part of the engagement, the English had no cavalry (for the Belgiau horse galloped off the field without striking a blow) and no artillery.

QUATREFAGES DE BRÉAU, JEAN LOUIS ARMAND DE, b. France, 1810; received a medical education at Strasbourg, and devoted himself especially to scientific studies. In 1829 he published an essay entitled *Théorie d'un Coup de Canon*; in 1830 a work *Sur les Aérolithes*; in 1832 a book *De l'Extraversion de la Vessie*; meanwhile acting as assistant professor in the university of Strasbourg; afterward engaged in the practice of medicine at Toulouse, and was a contributor to scientific periodicals. In 1850 he became professor of natural history in the Lycée Napoleon in Paris; in 1852 member of the academy of sciences; in 1855 was called to the chair of anthropology and ethnology in the museum of natural history, and in 1879 became a member of the royal geographical and acclimation societies of London. Among his other publications are *Études sur les Types inférieurs de l'Embranchement des Annelés*; *Physiologie comparée, Métamorphose de l'Homme et des Animaux*, 1862; *Les Polynésiens et leur Migrations*, 1866; *Charles Darwin et ses Précurseurs Français*; *La Race Prussienne*, 1871; and *L'Espèce humaine*, 1877.

QUATREFOIL, an opening in tracery, a panel, etc., divided by cusps or featherings into four leaves. This form is much used as an ornament in Gothic architecture.

QUATREFOIL, a heraldic bearing meant to represent a flower with four leaves. It is not represented with a stalk unless blazoned as *stipped*, in which case the stalk joins the lower leaf.

QUATREMÈRE, ETIENNE MARC, a learned French orientalist, was b. in Paris, July 12, 1782, and from his earliest childhood to his latest years was literally immersed in abstruse studies, and lived more after the fashion of a medieval recluse than a modern scholar. His public life was almost eventless. Employed in 1807 in the manuscript department of the *Bibliothèque Impériale*, he was promoted in 1809 to the Greek chair in the college of Rouen, and in 1819 to the chair of ancient oriental languages in the collège de France. In 1827 he became professor of Persian in the school for modern oriental languages. He died Sept. 18, 1857. Quatremère's erudition was something enormous, as might have been expected from his uninterrupted life-long devotion to study, but according to M. Ernest Renan (himself one of the first living orientalists), he was strikingly deficient in critical insight, and a genius for sagacious and luminous generalization. He would never believe in the hieroglyphic discoveries of Champollion; he despised comparative philology, and thought the labors of men like F. Schlegel, Bopp, Burnouf, etc., were wasted. But in less delicate fields of exploration he is safe. His historical and geographical memoirs, for example, are of incalculable value. Quatremère's principal works are—*Recherches sur la Langue et la Littérature de l'Égypte* (Par. 1808), in which it is shown, in the clearest manner, that the language of ancient Egypt is to be

sought for in the modern Coptic; *Mémoires Géographiques et Historiques sur l'Égypte* (Par. 1810); *Histoire des Sultans Mameloucks* (Par. 1837), from the Arabic of Makrizi; *Histoire des Mongols de la Perse* (Par. 1836), from the Persian of Rashid-Eddin; and his edition of the Arabic text of the Prolegomena of Ibn-Khaldun, one of the most curious monuments of Arabic literature. Besides these, a multitude of most valuable articles are scattered through the pages of the *Journal Asiatique* and the *Journal des Savants*. It is deeply to be regretted that circumstances interfered to prevent his executing certain great lexicographical works—Arabic, Coptic, Syriac, Turkish, Persian, and Armenian dictionaries—which he had planned, and for which he had gathered ample materials. His old master, Silvestre de Sacy, pronounced him “the only man capable of making an Arabic dictionary.”

QUATREMÈRE DE QUINCY, ANTOINE CHRYSOSTOME, 1755–1849; b. France; author of an *Essay on Egyptian Architecture*, and the *Dictionary of Architecture*, published in three quarto volumes; a participant in the French revolution; in 1815 superintendent of public monuments, and secretary of the academy of fine arts from 1816 to 1839. He also was the author of *Le Jupiter Olympien*, 1814; *De l'Imitation dans les Beaux Arts*, 1823; and lives of Michael Angelo, Raphael, and Canova.

QUA VER, in music, a note whose measure is equal to half a crotchet, one-fourth of a minim, or one-eighth of a semibreve. It is represented thus:

QUAY (Fr. *quai*), an artificial landing-place or wharf, consists usually of a platform on piles, or of masonry, surmounted with cranes, tramways, and other appliances for lading and discharging cargoes from shipping.

QUEBEC, the most important military position in the dominion of Canada, is situated on a steep promontory at the junction of the river St. Lawrence and St. Charles, in lat. 46° 48' n., long. 71° 12' west. It is distant from Liverpool about 2,070 m., is 180 m. n.e. of Montreal, 503 m. e.n.e. of Toronto, and 578 m. n.n.e. of New York. It is connected with all the cities in America by means of the Grand Trunk railway. The site of Quebec originally occupied by an Indian village named Stadacona, was discovered by Jacques Cartier in 1535; but the city was founded by Champlain in 1608. It continued to be the center of French trade and civilization, as well as of Roman Catholic missions in North America, till 1759, when it fell into the hands of Britain by the memorable victory of Wolfe on the heights of Abraham above the city. Quebec remained the chief city of Canada till the British settlements in the west were erected into a separate province, when it became the capital of Canada East, now forming the province of Quebec in the dominion of Canada. The citadel of Quebec is the most impregnable fortress on the continent of America. The view which it commands is one of the most magnificent in the world, and the scenery in its neighborhood, amid which are the falls of Montmorenci, imparts an additional attraction to the city. A seminary for the education of Roman Catholic clergymen was established in the city in 1636 by M. de Laval de Montmorenci, and was raised by the queen in 1854 into a university bearing Laval's name. A Presbyterian college, named after its founder, Dr. Morrin, was instituted in 1862, and affiliated in the following year to the McGill university of Montreal. Quebec is the seat of a Roman Catholic archbishop, and an Anglican bishop, whose respective cathedrals are among the finest specimens of Canadian church architecture. The church of Scotland and the principal denominations of dissenters are also represented in the city. From the building-yards of Quebec there are annually launched between 30 and 40 vessels of various tonnage. From 1400 to 2,000 vessels enter the port every year from the ocean, principally to export the produce of the country. The chief export trade is in timber. The principal imports are woolen, cotton, and silk goods; iron, coal, hardware, and salt. The exports amount to upward of £2,500,000 annually; the imports to about £1,500,000. Quebec has weekly communication by steam-packet with Liverpool and Glasgow, and fortnightly with London. The population in '71 was 59,699, a slight decrease from 1861, owing to the withdrawal of the garrison. The city returns three members to the dominion parliament and three to the provincial legislature.

QUEBEC (*ante*), a province of the dominion of Canada, formerly Canada East. It is situated between lat. 45° and 53° 30' n., and long. 57° 8' and 79° 30' w., and is bounded on the n. by Labrador and Hudson's bay; on the e. by Labrador and the gulf of St. Lawrence; on the s. by the bay of Chaleurs, New Brunswick, Maine, New Hampshire, Vermont, and New York; and on the s.w. by the Ottawa river and the province of Ontario. The area is about 193,355 sq. miles. South of the St. Lawrence river, which runs through the entire length of the province, the land is hilly, and n. of that river most of the country also is rocky and mountainous. The Notre Dame mountains, a continuation of the Green mountains in Vermont, extend e. from the latitude of the city of Quebec along the course of the St. Lawrence on its s. side to the gulf of the same name, attaining here and there a height of 3,000 or 4,000 feet. The Laurentian mountains, on the n. of the St. Lawrence, extend from the Labrador coast to the Ottawa river above Ottawa. This range also attains a height in some places of 4,000 ft. above the sea. Along the gulf of

St. Lawrence the province has a coast line of 1164 miles. The principal bays are Gaspé and Chaleurs. The St. Lawrence is the chief river and the great avenue of commerce. Its largest tributaries in the s. are the Chateaugay, which rises in New York and is navigable a considerable distance; the Richelieu, or St. John's, 80 m. long, the outlet of lake Champlain; the Yamaska, 90 m. long; the St. Francis, 100 m. long, which receives the Magog, the outlet of lake Memphremagog, and empties into the St. Lawrence at lake St. Peter; the Nicolet, Bécancour, Chaudière, Rimouski, and Matane. In the n. the largest tributaries from the St. Lawrence lying wholly within the province are the Saguenay and the St. Maurice rivers. Besides these rivers there are others branching out here and there as tributaries of the Ottawa, the longest of which are the Keepawa, 120 m.; the Gatineau, 400 m.; the Du Lièvre, 260 m.; and the Rivière du Nord, 160 miles. The lakes of the province are numerous, especially in the n.w. part. The largest is lake St. John, 30 by 25 m. in extent, about 120 m. n. of the city of Quebec. The great northern hill-region is scarcely habitable except in low fertile valleys, but it affords immense supplies of timber. Between the ranges of mountains on the s. and n. of the St. Lawrence, however, the country is a succession of fertile, prosperous valleys, and hills densely timbered, containing deposits of copper ores, iron, galena, small quantities of silver and gold, and many varieties of marble and serpentine; also excellent granite, slate, and soapstone. The climate is healthy, but subject to extremes of temperature. Winter begins about the end of November and lasts until the middle of April. All the territory which the province embraces, together with much more, was first taken possession of in 1534 by a Frenchman named Jacques Cartier. The first permanent settlement was made at what is now the city of Quebec in 1608 by the French; the next on the present site of Montreal in 1642; and from that period until 1759 the French continued to occupy the country, though much harassed by the Indians. During that year an English army, under gen. Wolfe, captured Quebec, and shortly afterwards the whole province was surrendered to the English with the rest of Canada. In 1794, when Canada was divided into two portions, this province became known as Canada East. Then in 1841 it was again united to Canada West. Upon the organization of the dominion in 1857, however, it was separated a third time, and became a distinct province with the city of Quebec as its capital. It is divided into 59 electoral counties, and the chief cities are Montreal (pop. in '71, 107,225), Quebec (pop. 59,699), Three Rivers (pop. 7,570), and St. Hyacinthe (pop. 3,746). In 1871 the total pop. of the province was 1,191,516, of whom 929,817 were of French origin, 123,478 of Irish, 69,822 of English, 49,458 of Scotch, 7,963 of German, and 148 of African. There were also nearly 7,000 Indians residing in the province. The numbers of persons engaged in various occupations and industries were: agriculture, 160,641; trade, 25,507; industrial pursuits, 65,707; professional, 15,376; servants, 21,186. The rest were unclassified. A majority of the inhabitants speak the French language, and the laws are obliged to be printed in both French and English. The region s. of the St. Lawrence river and w. of the meridian of Quebec is the portion most thickly settled. Among the agricultural products, oats, potatoes, and hay are the largest crops. Wheat, barley, rye, peas, beans, buckwheat, Indian corn, turnips, flax, apples, tobacco, and hops are also raised. The chief articles manufactured are flour, lumber, furniture, leather, hardware, paper, chemicals, soap, boots and shoes, cotton and woolen goods, steam-engines, and agricultural implements. Along the gulf of St. Lawrence most of the inhabitants are fishermen. Cod, herring, salmon, seals, mackerel, and lobsters abound in great numbers in the gulf, and the annual yield of the fisheries is usually large. For the year 1874 the amount derived from this occupation was estimated at \$1,608,660. The value of exports to foreign countries in 1874, chiefly forest products, fish and fish oils, furs, cattle, hides, and the ores of metals, was \$46,393,845, of which \$36,099,441 were to Great Britain, and \$5,812,596 to the United States. The principal articles imported were cotton and woolen goods, silks, iron and hardware, sugar, molasses, tea, tobacco, wheat, coal, and liquors. The total value was \$51,980,870, which included \$32,749,883 of imports from Great Britain and \$12,703,967 from the United States. The province is connected with the latter country and Ontario by several lines of railroads, the greatest among which is the Grand Trunk railway and its 5 branches.

The executive power of the province is vested in a lieut. gov., appointed by the gov. gen. of the dominion of Canada, assisted by a secretary and registrar, minister of public instruction, treasurer, attorney-general, commissioner of crown-lands, commissioner of agriculture and public works, and solicitor-general, appointed by himself. The provincial parliament consists of a legislative council of 24 members, appointed for life, and a legislative assembly of 65 (one from each electoral district), elected by the qualified voters for four years. The right of suffrage is conferred on all male British subjects 21 years of age who possess a small property qualification. The principal courts are the queen's bench, consisting of a chief justice and four puisné judges, and a superior court, with a chief justice and 25 puisné judges. The public schools are under the direction of the minister of public instruction, assisted by a council of 16 Catholics and 8 Protestants. They are classified as primary, model, and special schools, the last of which includes agricultural, high, commercial, industrial, and classical. There are also two Roman Catholic and one Protestant normal school supported by the province. Of the colleges and universities in the province, the most important are the university

of Bishop's college at Lennoxville, McGill university at Montreal, and the Laval university at Quebec, attached to which are medical, law, and theological schools. Besides these there are 12 or 15 classical colleges and about the same number of industrial colleges.

The majority of the inhabitants of the province are Roman Catholics. In 1871 they numbered 1,019,852 with 610 church organizations; and the Protestants 169,232, the chief denominations being Episcopal and Methodist. The Anglican church has bishops at Montreal and Quebec; the Roman Catholics at Quebec, Montreal, Ottawa, Three Rivers, St. Hyacinthe, and Rimouski. Of the Protestant church organizations, the Baptists have 32; the Episcopalians, 176; the Methodists, 131; and the Presbyterians, 94. See CANADA.

QUEBEC, a co. in the s. w. part of the province of Quebec, partly bordering on the n. bank of the St. Lawrence river, and including within its limits the city of Quebec; area, 2,598 sq. m.; pop. in '71, exclusive of the city, 19,607. Capital, Charlesbourg.

QUEDAH, KEDAH, KEDDAH, KEEDAH, or KIDAH, a half-independent state, on the w. coast of the Malay peninsula, on the strait of Malacca. It extends from about lat. 5° n., to lat. 7° n., and its average breadth is about 50 miles. The British province Wellesley, which lies between it and the sea-coast opposite to Penang, was separated from it and ceded to the British in 1800, by a treaty in which the British agreed to pay the rajah \$10,000 a year. Quedah nominally owes a kind of feudal subjection to Siam, but is in reality much more subject to the sway of Britain.—The capital, from which the state takes its name, stands at the mouth of a river also of the same name, in lat 6° 6' n., and long. 100° 20' east. Its pop. is estimated at about 21,000.

QUED LINBURG, a t. of Prussian Saxony, at the northern base of the Harz mountains, on the river Bode, and 35 m. s. w. of Magdeburg. Founded by Henry the Fowler in 920, it consists of an old town, a new town, and several suburbs, and is surrounded by a wall flanked with towers. On an eminence overlooking the town stands the castle, which, prior to the reformation, was the residence of the abbesses of Quedlinburg, who were independent princesses of the empire, and had a vote in the diet, and other privileges. This town was a favorite residence of the German emperors of the Saxon line. Here Klopstock was born. It is now the center of considerable industry. Cloth is manufactured, and there is a good trade in corn and cattle. Pop. '75, 17,044.

QUEEN (Sax. *cwæn*, woman; Gr. *gynē*, woman; Sansk. *gōni*, mother, from *gan*, to generate), in its primary signification, the king's consort, who has in all countries been invested with privileges not belonging to other married women. The English queen, unlike other wives, can make a grant to her husband, and receive one from him. She can sue and be sued alone, and purchase land without the king's concurrence. The statute of treasons makes it treason to compass her death, or to violate her chastity, even with her consent, and the queen consenting, is herself guilty of treason. If accused of treason, the queen is tried by the peers of the realm. A duty, amounting to one-tenth of the value of fines on grants by the crown, was in former times due to the queen, under the name of queen-gold. Charles I. purchased it from his consort, Henrietta Maria, in 1635, for £10,000, but it was not renewed at the restoration. The queen-consort is exempt from paying toll, and from amercedments in any court. She has a household of her own, consisting of six ladies of the bedchamber, a lord-chamberlain, vice-chamberlain, mistress of the robes, master of the horse, and three equerries, as also her attorney-general and solicitor-general, distinct from those of the king, who are entitled to take a place within the bar along with the king's counsel, and prosecute suits in law and equity for the queen. It has been the usual practice to crown the queen-consort with solemnities similar to those used in the coronation of the king. In the case of queen Caroline, consort of George IV., who was living apart from her husband, this was not done, though her right to coronation was argued by Mr. Brougham before the privy-council. Certain rents or revenues were anciently appropriated to the income of the queen, but no separate revenues seem ever to have been settled on any queen-consort by parliament. Her personal expenses are defrayed from the king's privy purse.

The *queen-dowager* is the widow of the deceased king. She retains most of the privileges which she enjoyed as queen-consort, nor does she lose her dignity by re-marriage; but it has been held that no one can marry the queen-dowager without permission from the king, on pain of forfeiture of lands and goods. On the marriage of a king, or accession of an unmarried prince, parliament makes provision for the queen's maintenance, in case of her survivance. An income of £100,000 a year, with two residences, was settled on the queen of George III.; and the same provision was made for the late dowager-queen Adelaide, at the commencement of the reign of William IV. The queen-dowager, when mother of the reigning sovereign, is styled the queen-mother. Until the time of George II., queens-consort bore the arms of the king impaled with their paternal coat, with the king's dexter and their paternal sinister-supporter; since that period, they have used both royal supporters. It is not usual to place the arms of the queen-consort within the garter.

The *queen-regnant* is a sovereign princess who has succeeded to the kingly power. In modern times, in those countries where the Salic law does not prevail, on failure of

males, a female succeeds to the throne. By an act of queen Mary, the first queen-regnant in England, it was declared "that the regall power of this realme is in the queene's majestie as fully and absolutely as ever it was in any of her most noble progenitours kinges of this realme;" and it has since been held that the powers, prerogatives, and dignities of the queen-regnant differ in no respect from those of the king. The husband of the queen-regnant is her subject; but in the matter of conjugal infidelity, he is not subjected to the same penal restrictions as the queen-consort. He is not endowed by the constitution with any political rights or privileges, and his honors and precedence must be derived from the queen. The late prince-consort was naturalized by 3 and 4 Vict. c. 1, 2, words being used which enabled him to be a privy-councilor, and sit in parliament; and by 3 and 4 Vict. c. 3, queen Victoria was empowered to grant him an annuity of £30,000; but it was provided that his royal highness was not, by virtue of his marriage, to acquire any interest in the property of her majesty. By a decree of the queen, prince Albert enjoyed place, pre-eminence, and precedence next to her majesty.

A queen-regnant is the only woman who is in her own right entitled to bear her arms in a shield and not in a lozenge. She is also entitled to the exterior ornaments of helmet, mantling, crest, and motto, and may surround her shield with the garter, and the collars and ribbons of all other orders of knighthood of which she is sovereign.

QUEEN ANNE, a co. in e. Maryland, adjoining Delaware; bounded on the w. by Chesapeake bay; drained by Chester river and Tuckahoe creek; traversed by the Queen Anne railroad; about 405 sq. m., pop. '80, 19,257—7,192 colored. The surface is rolling. The soil is fertile. The principal productions are corn, wheat, and pork. Co. seat, Centreville.

QUEEN ANNE'S BOUNTY, the name given to a fund appropriated to increase the incomes of the poorer clergy of England, created out of the first-fruits and tenths, which before the reformation formed part of the papal exactions from the clergy. The first-fruits are the first whole year's profit of all spiritual preferments, and the tenths are one-tenth of their annual profits, both chargeable according to the ancient declared value of the benefice; but the poorer livings are now exempted from the tax. Henry VIII., on abolishing the papal authority, annexed both first-fruits and tenths to the crown; and statute 2 and 3 Anne, c. 11, first formed them into a perpetual fund for the augmentation of poor livings, and advancing money to incumbents for rebuilding parsonages. The archbishops, bishops, deans, speaker of the house of commons, master of the rolls, privy-councilors, lieutenants, and *custodes rotulorum* of the counties, the judges, queen's serjeants-at-law, attorney and solicitor-general, advocate general, chancellors and vice-chancellors of the two universities, lord mayor and aldermen of London, and mayors of the several cities; and by supplemental character the officers of the board of green cloth, the queen's council, and the four clerks of the privy council, were made a corporation by the name of "the governors of the bounty of queen Anne, for the augmentation of the maintenance of the poor clergy;" and to this corporation was granted the revenue of first-fruits and tenths. Queen Anne's charter has been regulated and supplemented by a number of statutes, the latest being 33 and 34 Vict. c. 89. According to the rules established by the trustees, the sum allowed for each augmentation is £200, to be laid out in land to be annexed to the living; this donation to be made: 1. To all livings below £10 a year; 2. To all livings below £20; and so in order, while any remain under £50. But when any private benefactor advances £200 for the augmentation of any living not above £45 a year, the trustees give another £200, though it may not belong to the class of livings which they are then augmenting.

QUEEN ANNE'S FARTHINGs. The farthings of queen Anne have attained a celebrity from the large prices sometimes given for them by collectors. Their rarity, however, has been much overrated; it was, indeed, long a popular notion that only three farthings were struck in her reign, of which two were in public keeping—a third was still going about, and, if recovered, would bring a prodigious price. The queen Anne farthings were designed by a German of the name of Crocker or Croker, principal engraver to the mint, and were only patterns of an intended coin, having never been put into circulation; but they are by no means exceedingly scarce. A few of them were struck in gold.

QUEENBOROUGH, a village in the Sheppey district of Kent, about 2 m. s. of Sheerness. It was founded by Edward III. and named after his queen, Philippa. A line of steamers recently established between Queenborough and Flushing affords a direct and rapid passage from England to the continent.

QUEEN CHARLOTTE ISLAND AND QUEEN CHARLOTTE SOUND. See VANCOUVER ISLAND.

QUEEN OF THE MEADOW. See SPIRÆA.

QUEEN-POST, the side or secondary upright ties in a trussed-roof. See ROOF.

QUEENS, a co. in s. e. N. Y., on the w. end of Long Island, bounded by the sound and the Atlantic ocean; 410 sq. m.; pop. '80, 94,507—68,507 of American birth. The surface is hilly and the soil in some parts sandy, but usually very fertile; wheat, rye, oats, corn, barley, potatoes, and butter are the staples. There are more than 100 factories of different kinds; carriages, bricks, tin and iron ware, and cordage are among the chief

articles manufactured. Co. seat, Jamaica. Hempstead, Astoria, and Mincola are among the chief towns.

QUEENS, a co. in s. central New Brunswick, Canada; drained by the St. John's river, and intersected by the Grand Trunk railroad; 1480 sq. m.; pop. '71, 13,847, over 5,000 of Irish descent. The St. John's river is navigable to Frederickstown, or about 90 miles. Bituminous coal is found in large quantities near Grand lake. Co. seat, Gagetown.

QUEENS, a co. in s.w. Nova Scotia, Canada, on the Atlantic ocean, 1065 sq. m.; pop. '71, 10,554, about half of English descent. The coast is rugged, but the interior is well watered and fertile, and has much beautiful scenery. Co. seat, Liverpool.

QUEENS, a co. in center of Prince Edward's island; 771 sq. m.; pop. '71, 42,651. It is traversed by a railroad and drained by several small streams. Its capital, Charlottetown, is also the capital of the province.

QUEEN'S BENCH, or **KING'S BENCH**, one division of the high court of justice, other four divisions being chancery, common pleas, exchequer, and probate. The king's bench was so called from the origin of the court, inasmuch as the king used to sit there in person. In Cromwell's time it was called the upper bench. The court consists of five judges, a president (who is called the chief-justice of England, and is the highest of all the judges next to the lord chancellor), and four puisne judges called justices. In 1874 the old courts were reconstituted, and all were merged in the high court of justice, which consists of four divisions, each of which, however, retains nearly the same jurisdiction as before such change, and the only appeal from each is to the high court of appeal, which exercises the functions formerly vested in, and from remote antiquity exercised by, the house of lords. The ancient jurisdiction of the court and the history of its modifications are too technical to be stated in this place, but the outline of the leading points of jurisdiction may be shortly stated. The queen's bench is the highest court which has a criminal jurisdiction, and such jurisdiction is unlimited. But practically this jurisdiction is seldom exercised originally, for it is only when an indictment is removed from an inferior court into the queen's bench that a criminal trial takes place there, and this is only the case when there is some peculiar difficulty or importance attending the trial, which renders it expedient to remove it from the sessions or assizes. But though criminal trials in the queen's bench are exceptional, there are certain criminal matters which are part of its ordinary administration. A criminal information, for example, when filed by the attorney-general, or the master of the crown-office, charging a person with a criminal offense, is tried in the queen's bench as a matter of course, and can be tried in no other court. The queen's bench exercises a superintending control over all inferior tribunals, and also over public bodies, by commanding them to do a specific duty, the writ being called a writ of mandamus; or by prohibiting them from going on with some matter over which they have no jurisdiction, by a writ called a writ of prohibition. The queen's bench also entertains appeals from justices of the peace on a vast variety of matters. Besides the criminal jurisdiction, and the prerogative writs of mandamus, prohibition, and quo warranto, there is a civil jurisdiction belonging to the queen's bench of the most extensive kind; indeed, any civil action to recover debts and damages may be brought there. The civil jurisdiction is mostly shared in common with the other two common-law divisions. The judges of the queen's bench are often called the queen's coroners, having a universal jurisdiction of that kind throughout England, though seldom acting in that capacity. The chief-justice has latterly been usually made a peer, or has the option of becoming one if he pleases. The officers of the court are the master of the crown-office, who attends to the criminal department of the business, and several masters of the court, who attend to the civil department. The puisne judges of the court of queen's bench rank before those of the other two common-law divisions.

QUEENS' COLLEGE, CAMBRIDGE, was founded in 1446 by Margaret of Anjou, consort of Henry VI., and refounded in 1465 by Elizabeth Woodville, consort of Edward IV. The college consists of a president and 14 foundation fellows; the fellowships being tenable for 10 years from M.A. without being subject to any restriction whatsoever; while any fellow who takes holy orders, and has not a benefice of the net annual value of £300, may hold his fellowship for life. The new statutes provide that there shall be at least 14 scholarships, tenable till B.A., ranging between £30 and £50; the number and value of the scholarships to be augmented at the discretion of the president and fellows. Besides these, there are 5 exhibitions, ranging from £12 to £20; and there are funds to the amount of £120 per annum at the disposal of the president, for the behoof of deserving students of limited means. There are likewise a number of prizes, ranging from £5 to £30. The college holds the patronage of 10 benefices in the counties of Bucks, Cambridge, Essex, Leicester, Norfolk, Notts, and Wilts.

QUEEN'S COLLEGE, OXFORD. In 1340 Robert de Eglesfield, chaplain or confessor to queen Philippa, founded, by license from Edward III., a collegiate hall in Oxford, under the name of the hall of the queen's scholars. In his statutes he sets forth his motives and objects with unusual minuteness. Theological study was the main object of the foundation. Residence was rigidly enforced, and poverty enjoined with peculiar

force. The original number of the provost and fellows was to be 13, in memory of our Lord and the 12 apostles; and the ultimate number of poor boys to be educated on the foundation was 72, in memory of the 70 disciples. Few colleges, however, have disregarded more directly the wishes of their founders. When the commissioners under 17 and 18 Vict. c. 81, began their work, they found the poverty required changed into a provostship of £1000 a year, and fellowships of £300, the conditional preference to north countrymen converted into an absolute exclusion of all others; and the 72 poor children represented by 8 "taberdars," as they are called, who were alone eligible to fellowships. A separate foundation had been given to queen's by John Michel, Esq., in 1736, consisting of 8 open fellowships and 4 open scholarships. The commissioners introduced great changes. The foundations are consolidated, and the college now consists of a provost, 19 fellows, 15 scholars or taberdars, 2 Bible-clerks, and 4 Eglesfield exhibitioners. There are also upward of 20 exhibitions in this college, some of which are confined to natives of the northern counties. There are 30 benefices in the gift of the college, also the principalship of St. Edmund hall.

QUEEN'S COUNSEL are certain barristers who receive from her majesty a patent giving them preaudience over their brethren, and but for which they would rank only according to seniority of their standing as barristers. The advantage of appointing queen's counsel is this, that it enables the most able or successful counsel to take precedence of those of the same or longer standing, and to take the chief conduct of causes. In practice, there are almost invariably two counsel engaged on each side, called a leader and a junior, and the leader is generally a queen's counsel, and the junior is not. The appointment is made by the crown, on the nomination of the lord-chancellor. The practice of appointing crown counsel is adopted in Ireland, and also in Scotland. In the courts of chancery in England, it was usual for a queen's counsel to confine himself to a particular vice-chancellor's court, or to that of the master of the rolls, so that his clients might thus reckon on his attendance there; and when he went into another court, he required an addition to his fee. In the common-law courts, however, this arrangement was impracticable, and had never been adopted. It is sometimes popularly believed that the appointment of queen's counsel entitles the counsel to a salary from the crown; but this is a mistake, except as to the attorney and solicitor-general. When a queen's counsel is engaged in a criminal case against the crown, as, for example, to defend a prisoner, he requires to get special license to do so from the crown, which is always given, as a matter of course, on payment of a small fee. In courts of law and equity, a queen's counsel is entitled to preaudience over all other counsel, except those who were appointed queen's counsel before him. A queen's counsel has preaudience over all sergeants-at-law, though many of the latter obtain patents of precedence, which also make them in effect queen's counsel, as well as sergeants, and prevent them being displaced by those who come after them. The order of sergeants-at-law is much more ancient than that of queen's counsel, though now it is in point of rank inferior. The practice of appointing queen's counsel is not older than the time of sir Francis Bacon, who was the first appointed.

QUEEN'S COUNTY, an inland co. of the province of Leinster, Ireland, is bounded n. by the King's county, e. by Kildare and Carlow, s. by Kilkenny, and w. by Tipperary and King's county. Area, 424,854 acres, of which 363,153 are arable. The population, which, in 1831, was 90,750, had fallen in 1871 to 79,771, of whom 70,186 were Catholics, 8,632 Protestant Episcopalians, and the rest Protestants of other denominations. The number of acres under crop in 1875 was 143,211; cattle, 77,241; sheep, 100,502; pigs, 29,098. Queen's county for the most part is within the basin of the Barrow, which is the chief river, and is partly navigable for barges. On the north-western border lie the Slieve Bloom mountains, and the Dysart hills occupy the s.e., the rest of the surface being flat or gently undulating. In its geological structure, it belongs to the great limestone district; but the Slieve Bloom mountains are sandstone, and the Dysart hills include coal, but not in deep or profitably worked beds. Coarse linen and cotton cloths are manufactured in small quantities. The chief town is Maryborough; pop. '71, 2,731. The national schools in 1875 were 96; pupils, 12,553. Queen's county anciently formed part of the districts of Leix and Ossory; and on the submission of O'More to the English, the territory retained a qualified independence. Under Edward II. the O'Mores became so powerful that a protracted contest was maintained by them with the English. In the reign of Edward VI., Bellingham, the lord-deputy, succeeded in reannexing the territory of the O'Mores to the Pale (q.v.); and a new revolt in Mary's reign led to measures by which it was finally reduced to a shire, under the name of Queen's county, in honor of Mary, from whom also the chief town, Maryborough, was called. There are a few antiquities of interest—a perfect round tower, and two in a less perfect condition, and some ecclesiastical and feudal remains, the most important of the latter being a castle of Strongbow on the picturesque rock of Dunamase. Queen's county is traversed by the Great Southern and Western, and by the Midland Great Western railways, and also by a branch of the Grand canal. It returns two members to parliament.

QUEEN'S EVIDENCE. See KING'S EVIDENCE.

QUEENSFERRY, SOUTH AND NORTH. South Queensferry is a royal and parliamentary burgh in Linlithgowshire, on the s. shore of the firth of Forth, about 9 m. w.n.w. of

Edinburgh. It was erected into a royal burgh in 1636, but was for centuries before a burgh of regality. The walks and scenery about South Queensferry, with Hopetoun house and grounds on the w., and Dalmeny park on the e., are very beautiful, and the town itself is a good deal resorted to for sea-bathing. The Forth—much wider both above and below the ferry—here narrows to a width of only about two miles. It receives historical mention as early as the middle of the 11th c., as the ferry across which royal personages passed when traveling between Edinburgh and Dunfermline. The foundation stone of a railway-bridge across the Firth here was laid Sept. 30, 1878. Pop. '71, 1521, within the parliamentary bounds. South Queensferry is one of the Stirling district burghs.—North Queensferry, a small village in Fifeshire, on the n. shore of the firth of Forth, opposite South Queensferry; pop. '71, 382.

QUEENSLAND. This prosperous British colony occupies the whole of the north-eastern portion of Australia, commencing at a point of the e. coast about 400 m. n. of Sydney, called Point Danger, in lat. 28° 8' south. The greater portion of the southern boundary-line is formed by the 29th parallel of s. latitude. The eastern sea-board extends about 1800 m. to cape York, the extreme northern point of the continent, in lat. 10° 40'. The mean breadth of the territory is 900 m., from the eastern coast-line to the meridian of 138° e. long., which forms the western boundary-line. This includes the greater portion of the gulf of Carpentaria, which has a seaboard of about 900 miles. The whole of Queensland comprises 669,520 sq. m.—nearly twelve times the area of England and Wales.

The portion of the colony extending along the eastern coast is indented with numerous bays, which are the outlets of many navigable rivers, having their sources in the cool gorges and deep recesses of a great mountain range, running n. and s., parallel with the sea-coast, at a distance of from 50 to 100 miles. The summits of this great "dividing range" rise from 2,000 to 6,000 ft. above the level of the sea. Numerous spurs are given off from the range in ridges sloping gradually toward the coast. These ridges are generally composed principally of quartz, and in many places form good natural roads for a considerable distance. The ridges are usually covered with a variety of fine and valuable timber. The iron-bark, blood-wood, box, and other descriptions of wood, very valuable to the farmer for fencing and building, are found here in great abundance.

Unlike almost every other portion of Australia, Queensland is correctly described as a "land of rivers and streams." These rivers find an outlet in the many large and beautiful bays and estuaries on the eastern sea-board. One of these, Moreton bay (q. v.), receives the waters of five rivers, which are always navigable. The largest of these, the Brisbane, is navigated by good-sized steamers for 75 m., and is nearly a quarter of a mile wide at a distance of 15 m. from its mouth. The principal rivers on the eastern sea-board are the Brisbane, the Burnett, the Mary, the Calliope, the Boyne, the Fitzroy, the Pioneer, and the Burdekin. The longest tidal river in Queensland is the Fitzroy, which drains an area of not less than 50 millions of acres, and is navigable as far as Yaruba, 60 m. from its estuary in Keppel bay. It receives, as its principal tributaries, the Dawson, Mackenzie, and Isaacs, large streams flowing for several hundred miles from the n.w., w., and s.w. parts of the interior. The tide at Rockhampton (40 m. from the embouchure of the river) rises 14 ft., and the stream is thus rendered navigable for vessels of considerable burden.

The banks of the rivers are usually well elevated, and in many places consist of very rich alluvium, brought down from the great mountain-ranges. This alluvial soil is frequently of very great depth, and is marked everywhere by a magnificent growth of timber, very unlike the ordinary Australian wood. The enormous fig-trees and gigantic eucalyptæ tower aloft, and spread out their great arms, festooned with vines and flowering parasites, which throw themselves over every spreading branch, and deck it with their varied and brilliant colors; the tall pine trees shoot up their straight stems to a great height; while the cedar, the myrtle, the rosewood, and tamarind trees, display their rich and green foliage in every variety of shade. A thick evergreen hedge of mangroves covers the banks, preserving them from the wash of the stream; and at certain seasons of the year, this is fringed with thousands of flowering lilies.

Ordinarily, the eastern sea-board part of the country assumes very much the appearance of park-scenery in Great Britain, the trees standing at some distance apart, and the ground between them being covered with grass, which is generally green and luxuriant throughout the whole year. The regularity of the showers which fall in the summer season keeps the grass growing with luxuriant verdure generally during the hot months. Exceptions to this sometimes occur, and a dry summer appears to have been experienced in this part of Australia about once in every six or seven years. The summer of 1863 formed one of these exceptional seasons. The frosts of winter being generally so slight as not to injure the vegetation, the country is almost always green from January to December.

Beyond the "Andes," or great dividing-range, the country presents features of still greater beauty and fertility. Vast plains—10, 15, or 20 m. across—stretch out their level surface unbroken by a single tree, but covered with luxuriant grass, and often purpled over with fragrant herbage. These great plains are composed of rich black soil. They

are well watered with a net-work of streams, which trickle down from the gradual slopes of the mountain-range. The soil in this locality is admirably adapted for tillage; and within a certain distance of the mountain-range, the rains fall with great regularity. The land here is lightly timbered, and is cleared with less labor than on the lower lands, and the soil is proved to be peculiarly adapted for the growth of wheat of the finest quality. The yield per acre in this locality has sometimes been as much as 50, and even 60 bushels to the acre, of 63 lbs. to the bushel. The average yield may be estimated at 30 bushels per acre. Indian corn and other cereals, as well as all the European fruits, grow luxuriantly, and come to the greatest perfection in this highly favored locality, which has been called the "Garden of Queensland."

This country, w. of the great dividing-range, stretches away in a series of fine plateaux for a distance of 400 or 500 m. westward, and, with the interruptions of other mountain-ranges crossing the main range at right angles, for upward of 1000 m. toward the fertile plains bordering the shores of the gulf of Carpentaria.

A third distinct portion of Queensland is formed by the country, which falls off in a succession of steep declivities, or more gradually descending terraces, from the table-land thus described, toward the lower land, which then intervenes between these terraces and the western boundary-line of the colony and of South Australia. This portion of the territory has been rendered specially interesting from the recent discoveries, which have shown that instead of a vast and sterile desert of burning sands, the interior of Australia is, with exceptional patches of very limited extent, well grassed and watered, and suitable for pastoral, and in many places even for agricultural occupation.

The climate of Queensland is said closely to resemble that of Madeira (q.v.); the mean annual external shade-temperature taken at Brisbane being very nearly the same as at Funchal in Madeira, though it is a little hotter in the summer, and colder in the winter at Brisbane than at Funchal. Moreton bay, now in Queensland, has for many years been the resort of invalids from all the other British colonies in the southern hemisphere, and has been called the Montpelier of Australia. The summer season is hot—the thermometer rising sometimes to 100° or even 120° in the shade; but the air is dry, elastic, and healthy, and the sea-breezes temper the heat, and make it perfectly endurable, even to the outdoor laborer, in the hottest time of the year. However hot the day, the night is almost invariably cool, even in the most northern parts of the colony.

The capital of Queensland, and the seat of the local government, is Brisbane (q.v.); pop. '76, 26,953. Its situation is exceedingly beautiful. Ipswich, Rockhampton, Maryborough, Toowoomba, Gayndah, Dalby, and Bowen are rapidly rising towns. Rockhampton has already attained great importance, and promises ere long to be the metropolis of Queensland. Although only recently established, its population already exceeds 6,000 souls, and is rapidly increasing. Situated upon the largest navigable river of Queensland, it forms the commercial center and principal outlet of immense tracts of the interior country. A railway has been constructed from Rockhampton to Westwood in the direction of Peak Downs, where extensive copper mines, said to vie in richness with those of Barra Barra, have been opened up, and valuable gold deposits are also being worked.

The alienation of crown-lands act, passed during the first session of the colonial parliament, revolutionized the old plan of selling land at a high upset price at auction, and the disposal of lands in Queensland is now regulated by an act passed by the colonial legislature in 1868. The following are among its provisions: Reserve lands are to be open for selection by conditional purchasers, and to be divided into (1) agricultural, (2) first-class pastoral, (3) second-class pastoral. These different classes of land are to be purchasable at the rate of 15s., 10s., and 5s. an acre respectively, payable in ten equal annual installments, in addition to survey fees. Lands thus selected are to be held on lease till the purchase-money is paid, on condition that the lessee shall inclose the land with a substantial fence, and that he shall reside on the land continuously during the period of the lease. But if within a shorter time the lessee can show that he or his bailiff has resided on the land for two years, and has made certain improvements, a grant in fee may be issued on payment of the balance of the ten years' rent. Again, heads of families, and persons 21 years of age, may select as "homesteads" lots not exceeding 80 acres of agricultural, or 160 acres of pastoral land, on payment of an annual quit-rent of 9d. per acre for the former, and 6d. per acre for the latter, during five years; the grant not to issue till the expiration of that period, and proof of continuous residence and cultivation of one-tenth of the land, or erection round it of a substantial fence. "Unconditional sales" may be made by auction. The acquirement of land by emigrants direct from Europe is facilitated by the grant of land-orders, which may be issued to each approved person who shall have paid the full cost of the passage of himself or other member of his family. The land-order warrant entitles the person, after proving that he has resided in the colony continuously for 12 months, to receive for himself and each adult member of his family a land-order to the extent of £20, and one for half that amount for each child between 1 and 12 years of age. In 1877 the number of arrivals in Queensland was 22,596, of whom 1926 were South-sea islanders, and 5,493 were adult immigrants brought out under government auspices. During the same year 10,408 persons left the colony.

The system of free grants of land to persons paying their own full passages has had the intended effect of attracting a large number of small and larger capitalists; while a system of assisted and free passages, established by a wise adoption of the same land-order system, has freely supplied a class of industrious mechanics, farm-laborers, and general servants. Notwithstanding this the demand for labor of all kinds is still on the increase.

The agricultural capabilities of Queensland are not confined to the elevated tablelands before alluded to as "the garden of the colony." On the lower lands, on the rivers and bays, and on the fertile valleys and sunny slopes of the eastern side of the range, there are many millions of acres of land immediately available for settlement, and admirably suited for tillage. In this portion of the colony settlement is advancing by a class of small proprietary farmers. The land is described as very productive, yielding two crops in the year, and capable of producing almost everything that can be grown in any part of the world. Oranges, pine-apples, figs, bananas, grapes, mulberries, peaches, nectarines, granadillas, alligator pears, guavas, flourish in great perfection and abundance, and are seen growing up side by side with wheat, maize, potatoes, and all the fruits, flowers, and vegetables of northern Europe.

Great and rapid progress has of late been made in the cultivation of cotton. The cotton-plant is said to be indigenous in this part of Australia, and in consequence of the absence of severe frosts it is also perennial. In the reports drawn up by the most competent judges on the samples of cotton from all parts of the world at the international exhibition, we find it stated, "The samples of Sea islands' cotton from the Australian colonies are far superior to cotton from any other part of the world." The New Orleans variety from Queensland is also spoken of in the report as "particularly good." Seven medals were awarded to Queensland growers, and the distinction of honorable mention was conferred on five more. The average yield per acre was estimated at 400 lbs. of Sea islands, and from 600 lbs. to 700 lbs. of Orleans; being two-thirds in excess of the average yield of the two sorts taken together in America, which is 300 lbs. per acre. The cultivation of the sugar-cane is also rapidly extending, and is proving to be one of the most remunerative products of the colony. The yield varies from one to three tons to the acre. The development of this branch of agriculture led to the introduction of South-sea islanders as laborers; the employment of whom is carefully regulated by the "Polynesian laborers act" of 1868, but is nevertheless regarded by many with great suspicion, as involving something akin to the slave-trade.

In the year 1875 the total extent of land under crops and grass was 77,347 acres. The live-stock consisted of 121,497 horses, 1,812,576 cattle, 7,227,774 sheep and lambs, and 46,447 pigs. The sugar crop produced 12,108 tons of sugar, and 651,259 gallons of molasses.

The mineral resources of Queensland are large. In 1877 the gold sent from the diggings was 373,266 oz., valued at £1,306,431; from Jan., 1860, to the end of 1874, £5,444,273 worth of gold was exported. Recently tin has been found in immense quantities, £353,550 worth being exported in 1874, besides £149,696 worth of copper. During 1874-75, 43,443 tons of coal were raised. Pearl-fishing is also carried on with encouraging results.

The chief exports are wool, tallow, gold, copper, cotton, live stock, hides, timber, and provisions. In 1874 the vessels which entered the ports of Queensland numbered 713, of an aggregate tonnage of 302,825; and 657, of 269,925 tons, cleared out. In 1875 the wool exports were 20,145,914 lbs., valued at £1,366,030; cotton, 314,454 lbs., at £8,162; preserved meat had a value of £53,198. The gross revenue was £1,261,464; expenditures, £1,404,198. The imports were £3,328,009, and the exports £3,857,576. At Jan. 1, 1877, there were 327 m. of railway and 4,708 m. of telegraph open. Taxation per head, £3 11s. 3¼d. Import and export trade per head, £45 11s. 6d.

Queensland is a great pastoral country. It was an idea generally received until within the last few years, that the quality of Australian wool would degenerate as the sheep were driven toward the north. The reverse of this, however, proves to be the case. The Queensland wool is remarkable for the fineness of its quality; and this seems to be increasingly the case as the pastoral occupation of the country extends northward toward the plains of Promise on the gulf of Carpentaria. The wool diminishes a little in quantity, the fleeces being lighter, but the increased fineness of the wool more than makes up for a little diminution in its quantity.

Queensland was erected into a separate and independent colony in Dec., 1859. The government is vested in a governor (the queen's representative), an executive council, and two houses of parliament. The legislative council consists of 30 members, nominated by the crown for life, under a president elected by themselves. The house of assembly comprises 55 deputies elected for five years. The number of registered electors is 35,197. The suffrage is not universal, but within the reach of every industrious man after a twelvemonth's residence. Voting is by ballot. State aid to religion was abolished by one of the first acts of the parliament. An excellent system of primary education, which since 1870 has been made free, is in successful and vigorous operation throughout the colony. The population in the beginning of 1871 was 120,306, which had been augmented on May 1, 1876, to 173,283.

QUEEN'S METAL, an alloy formed by fusing 100 parts of tin with 8 parts of antimony, 4 parts of copper, and 1 part of bismuth. It is a kind of Britannia metal, and is used for tea-pots and similar articles of domestic utility.

QUEEN'S REGULATIONS, or **KING'S REGULATIONS**, are those collections of orders and regulations in force in the army and navy respectively, which serve to guide commanding and other officers in all matters of discipline and personal conduct. The queen's regulations for the navy also in a great degree regulate matters of finance; whereas, in the army, financial matters are left to the war-office regulations (q. v.). The reason for this distinction is, that as regards the navy, the admiralty are responsible both for discipline and finance; while in respect to the army the officer commanding-in-chief controls the discipline, and the financial secretary the finance, both of course being responsible to the secretary of state for war, and through him to parliament. The regulations for the army were first collected in 1788, since which several editions have been issued, the last being in 1873. The latest admiralty regulations bear date 1844. The current regulations are supplemented, corrected, and canceled by numerous circulars and addenda; so that they never represent the whole body of military or naval rules for many days together.

QUEEN'S TOBACCO-PIPE, the facetious designation of a peculiarly shaped kiln, which is situated in the n.e. corner of the tobacco warehouses belonging to the London docks. These warehouses are rented by government at £14,000 annually. The kiln consists of a circular brick stalk, bulging out at the bottom to a width of five feet inside. A side-door of massive iron, lettered "V. R., the kiln," gives access to the interior, in which are piled up damaged tobacco and cigars, and contraband goods, such as tobacco, cigars, tea, etc., which have been smuggled, books which are attempted evasions of the copyright act, etc., till a sufficient quantity has accumulated, when the whole is set fire to and consumed. The total value of the goods thus destroyed is enormous; and though this wanton destruction has often been censured, government still persists in the practice of periodically filling and lighting "the queen's pipe."

QUEENSTOWN, called formerly **COVE OF CORK**, Ireland, a seaport t., on the s. side of Great Island, in the harbor of Cork, is distant from Cork 14 m. e.s.e., and from Dublin 157 m. s.w. by west. It rose into some importance during the French war, as the port of embarkation for troops going on foreign service, and is now an admiral's station. On the occasion of the queen's visit in 1850, the name Queenstown was given to it in honor of her majesty. The formation of the town is rather peculiar, as it occupies the sides of an amphitheater, around which it is built in parallel streets. It enjoys a high reputation for its mild and salubrious climate, and is much frequented by invalids during the winter season. A splendid Roman Catholic cathedral, estimated to cost £100,000, is in course of erection; it will be 100 ft. in height, surmounted by a tower of 230 feet. Pop. '71, 10,334.

QUEEN'S YELLOW. See **YELLOW COLORS**.

QUEKETT, JOHN THOMAS, 1815-61; b. Eng.; studied medicine at the London hospital in 1831; became a licentiate of the apothecaries' company and a member of the Royal college of surgeons; in 1843 appointed assistant conservator of the Hunterian museum, and in 1856 conservator of the museum and prof. of histology on the retirement of prof. Owen. He published *Practical Treatise on the Use of the Microscope; Lectures on Histology*, 2 vols.; *Illustrated Catalogue of Specimens in the College Museum in Lincoln's Inn Fields*.

QUELPAERT, an island off the s. coast of Corea, the scene of many shipwrecks of vessels of various nations. The island is distant 60 m. from the main-land, is very fertile, and its extensive plains are well cultivated. Cattle and small wild horses are very numerous. Timber abounds on the hills, over which mount Auckland, 6,600 ft. high, towers in imposing proportions, its masses of white rock seen far out at sea resembling snow. The chief industry of the dense population is straw-plaiting, the best hats in Corea coming from this island. Having long been a place of exile for convicts, the character of its inhabitants is not reputed very high, though shipwrecked foreigners have been, in the main, kindly treated. Its rock-bound coast has scarcely a harbor worthy of the name.

QUERCITRON, the name both of a dyestuff and of the species of oak of which it is the bark. This oak (*quercus tinctoria*), also called *dyer's oak* and *black oak*, is a native of North America—one of the noblest forest trees of the United States, found in New England, and as far south as Georgia, although there only at a considerable elevation. The name black oak is given to it from the dark color of its outer bark. The leaves are obovate-oblong, dilated outward, and widely sinuated; with short, obtuse, and bristle-pointed lobes. The wood is reddish, coarse-grained, and porous, but much esteemed for strength and durability, and is used in America for ship-building. The bark is used for tanning as well as for dyeing. It is the inner bark which is the quercitron of dyers. It yields a yellow crystallizable substance, *quercitrin* ($C_{20}H_{18}O_{20} + 2Aq$), which may be extracted by means of alcohol; the tannic acid, which is simultane-

ously taken up, must be precipitated by the addition of gelatine, after which the liquid will, on evaporation, yield crystals of quercitrin. On the addition of alum, its solution assumes a beautiful yellow color; and solutions of acetate of lead, acetate of copper, and chloride of tin precipitate it in yellow flakes. When boiled with dilute acids, it breaks up into glycose and *quercetin* ($C_{24}H_{12}O_{10}$)—a yellow crystalline substance, which is soluble in alkaline solutions, to which it communicates a golden-yellow color. The decomposition shows that quercitrin belongs to the glycosides, or compounds which, when broken up, yield sugar.

QUERÉTA'RO, one of the smallest of the Mexican states, situated on the Anahuac table-land between the states of Mexico, Michoacan, Guamajuto, San Luis Potosi, and Hidalgo; about 3,205 sq.m.; pop. 171,666, many of whom are Indians. The soil is fertile; maize and cotton are raised, besides the common fruits and cereals. There are mines of silver, lead, copper, and iron. The principal manufactures are woolen cloth, cotton goods, soap, pottery, and iron-ware.

QUERETA'RO, an important t. of Mexico, capital of a state of the same name, is charmingly situated on a hilly plateau, 6,365 ft. above sea-level, 110 m. n.w. of Mexico. It is built on a regular plan, contains 11 convents, 3 great squares, many richly-decorated churches, etc. Water is supplied from an aqueduct 10 m. long, and supported in part upon arches 90 ft. high. Woolen and cotton goods and leather are the chief manufactures. Queretaro contains the largest cotton-spinning mill in the country; 3,000 hands are employed in it. Here, when the town, after a long defense, fell into the hands of the republicans, the emperor Maximilian was shot by order of a court-martial, June 19, 1867. Pop. 48,000.

QUERN, a primitive mill for grinding corn, the stone of which was turned by the hand before the invention of windmills or water-mills. It is a contrivance of great antiquity, and so well adapted for the wants of a primitive people, that we find it perpetuated to the present day in remote districts of Ireland, and some parts of the western islands of Scotland. The remains of querns have been dug up in Britain, Ireland, and continental Europe, wherever the traces of ancient population are found. They occur in the Scottish earth-houses (q.v.), or cyclopean underground dwellings; in the cran-nogs (q.v.), or lake-dwellings of Ireland and Scotland; and the very similar *pfahlbauten* of Switzerland; and abundantly among the remains of the Roman period in Britain and northern Europe. The most usual form of quern consists of two circular flat stones, the upper one pierced in the center with a narrow funnel, and revolving on a wooden or metal pin inserted in the lower. The upper stone is occasionally ornamented with various devices; in the Roman period, it is sometimes funnel-shaped, with grooves radiating from the center. In using the quern, the grain was dropped with one hand into the central opening, while, with the other, the upper stone was revolved by means of a stick, inserted in a small opening near the edge. As early as 1284 an effort was made by the Scottish legislature to supersede the quern by the water-mill, the use of the former being prohibited except in case of storm, or where there was a lack of mills of the new species. Whoever used the quern was to "gif the thretein measure as multer;" the contravener was to "tine [lose] his hand-mylnes perpetuallie." This enactment did not, however, prevent hand-mills from being largely used in Scotland down to the beginning of the present century.

Probably the oldest type of quern is that which was fashioned from a section of oak; one of this description was found in Scotland in 1831, in the course of removing Blair Drummond Moss. It is 19 inches in height by 14 in diameter, and the center is hollowed to a depth of about a foot, so as to form a mortar, in which the grain seems to have been pounded by a wooden or stone pestle.

A less simple variety of the hand-quern, known as the pot-quern, and also of great antiquity, consists of a circular stone basin, with a hole through which the meal or flour escapes, and a smaller circular stone fitting into it, perforated with an opening through which the grain was thrown into the mill. A number of querns of this description have been exhumed in Scotland, and still more in the bogs of Ireland, in which country the pot-quern is believed not to be yet altogether disused. The one in the museum of the Scottish antiquaries is of unusually large size, 17 inches in diameter, and 8½ high, and was discovered in the parish of Gladsmuir, in east Lothian. It is made of coarse pudding-stone, and is furnished with holes in the sides, to which handles were probably attached. The iron ring is a modern addition.—See Dr. Wilson's *Archæology and Prehistoric Annals of Scotland*, vol. i. p. 211, *et seq.*, 2d edition (London and Cambridge, 1863).

QUESADA. See XIMENES DE QUESADA.

QUESNAY, FRANÇOIS, an eminent French economist and physician, was born at Mérey, near Montfort-P. Amaury, June 4, 1694, and studied at Paris, where in 1718 he passed surgeon with a high reputation. He acquired a high reputation in his profession, and at his death, in 1774, was first physician to the king. But Quesnay's fame depends almost wholly on his economic speculations, which are to be found scattered through the pages of the famous *Encyclopédie* (see, for example, the articles "Fermiers" and

"Grain"), the *Journal d'Agriculture*, and the *Ephémérides au Citoyen*. He is the inventor of the term "political economy," and one of the earliest and most distinguished writers on the subject. His views were systematically set forth in a little treatise, entitled *Tableau Economique*, which was nicknamed by La Harpe, the *Alcoran des Economistes*. Only a few copies of this work were printed about the end of the year 1758, and these have now all disappeared. Nevertheless, the principles maintained by Quesnay are well known, partly from the sources above mentioned, but chiefly from other treatises that have met with a better fate than the *Tableau*, viz., his *Maximes Générales du Gouvernement Economique d'un Royaume Agricole*, the notes to which occupy more space than the text; *Le Droit Naturel*; *Analyse du Tableau Economique*; *Problèmes Economiques*; and *Dialogues sur le Commerce et sur les Travaux des Artisans*, all of which are to be found in Dupont's *Recueil* of Quesnay's writings (Leyden and Paris, 1768).

QUESNEL, PASQUIER, a French theologian, was b. at Paris, July 14, 1634, and having been educated in the Sorbonne, entered the congregation of the Oratory in 1657. He obtained even early in his career the reputation of a profound familiarity with Scripture and the fathers; and by several popular ascetical treatises which he published, he attracted so much notice, that, at the early age of 28, he was appointed director of the Paris house of his congregation. It was for the use of the young men under his charge that he commenced the series of his afterward celebrated *Réflexions Morales*. The first specimen of this work having been much admired, Quesnel continued to extend it to other portions of the New Testament. Soon afterward he published an edition of the works of St. Leo (2 vols. 4to, Paris, 1675), which has been much criticised. His residence at Paris, however, was cut short by the disputes about Jansenism. Having refused to sign certain propositions, subscription to which was, by a decree of 1684, required of all members of the Oratory, Quesnel left the congregation and retired to the Low Countries, where he attached himself to the party of Arnauld, in which he speedily rose to the first position of influence and authority. He continued at Brussels his *Réflexions Morales*; and in 1693-94 the reflections on the New Testament were published in a complete form, with the approval of the cardinal de Noailles, bishop of Châlons, and ultimately archbishop of Paris. The work, however, on examination, was found to contain all the most obnoxious doctrines of Jansenius; and Quesnel, having been denounced to the authorities, was arrested, by order of Philip V., and put into prison. He escaped, and betook himself to concealment. But his book was condemned, first by the decree of an assembly of the bishops of France, and afterward by a decision of Clement XI. in 1711, and finally by the celebrated bull *Unigenitus*, Sept. 8, 1713. With this condemnation the formal dogmatic declarations of the Roman church on this controversy may be said to have ceased. The controversy continued, but nothing, or very little, that was new was afterward elicited. Quesnel withdrew to Amsterdam, where he lived to a great age, not having died till 1719, in his 85th year. Besides the *Réflexions Morales*, he left a vast number of treatises, chiefly ascetical. The few dogmatical essays which he published, as well as his critical edition of St. Leo, are all tinged with his peculiar opinions. The *Réflexions Morales* falling in, in the main, with the views of one of the religious parties in the Protestant church, has been translated into German and English, and at one time enjoyed considerable popularity both in England and in Germany.

QUESTOR (Lat. contr. from *quæstor*, a searcher or investigator, from *quæro*, to seek or search into) was anciently the title of a class of Roman magistrates, reaching as far back, according to all accounts, as the period of the kings. The oldest questors were the *questores parvitiæ* ("trackers of murder," ultimately public accusers), who were two in number. Their office was to conduct the prosecution of persons accused of murder, and to execute the sentence that might be pronounced. They ceased to exist as early as 366 B.C., when their functions were transferred to the *triumviri capitales*. But a far more important though later magistracy was the *questores classici*, to whom was intrusted the charge of the public treasury. The exact date of their institution cannot be ascertained, but it was subsequent to the expulsion of the kings. They appear to have derived the epithet of *classici* from their having been originally elected by the centuries. At first they were only two in number, but in 421 B.C. two more were added. Shortly after the breaking out of the first Punic war the number was increased to eight; and as province after province was added to the Roman republic, they amounted, in the time of Sulla, to twenty, and in the time of Caesar to forty. On its first institution the questorship (*quæstura*) was open only to patricians; but after 421 B.C., plebeians also became eligible.

QUETELET, LAMBERT ADOLPHE JACQUES, a celebrated Belgian statistician and astronomer, was b. at Ghent, Feb. 22, 1796, and studied at the lyceum of his native city, where, in 1814, he became professor of mathematics. In 1819 he was appointed to the same chair at the Brussels atheneum; and in 1826 was chosen by king William I. to superintend the construction of the royal observatory in the capital, of which he became director in 1828. In 1836 he was made professor of astronomy and geodesy at the Brussels military school. Elected a member of the Belgian royal academy in 1820, he became perpetual secretary in 1834. Quetelet was besides a corresponding member

of the institut de France and of the royal society of London. Among his numerous and valuable writings are: *Astronomie Élémentaire* (Par. 1826; 4th ed. Brux. 1848); *Recherches sur la Population, les Prisons, les Dépôts de Mendicité, etc., dans le Royaume des Pays-Bas* (Brux. 1827); *Recherches sur la Reproduction et la Mortalité et sur la Population de la Belgique* (Brux. 1832); *Statistique Criminelle de la Belgique* (Brux. 1832); *Sur l'Homme et le Développement de ses Facultés ou Essai de Physique Sociale* (Par. 1835); *Du Système Sociale et des Lois qui le régissent* (Par. 1848); and *Physique* (Brux. 1855). Quetelet was also one of the most efficient collaborateurs in drawing up the *Bulletin de la Commission Centrale de Statistique*, the *Annales des Mines*, the *Journal des Economistes*, the *Annales des Travaux Publics*, the *Trésor National*, etc. He also published numerous papers on meteorology, astronomy, terrestrial magnetism, etc., in the *Mémoires* and *Bulletins* of the Belgian royal academy. He died in 1874.

QUETZALCOATL (*Aztec*, a feathered serpent or twin), the god of the air, one of the most important figures in the ancient Mexican theology. There are many conflicting legends in regard to this deity, but the main features of his earthly career, as generally agreed upon, are that he appeared mysteriously from the east, and established himself in the valley of Sula, teaching the inhabitants the arts of peace, and exhorting them to kindness and benevolence and purity of life; that having incurred the malice of the god Tezcatlipoca, he withdrew to Cholula where he remained for twenty years, during which time the famous pyramid, still standing there, was erected in his honor; and that he then disappeared as mysteriously as he had come, with a promise to return hereafter. The fulfillment of this promise was looked for among the Mexicans with as much confidence as was the advent of the Messiah by the Jews, and much of Cortez's early success was due to the fact that when he first landed in Mexico he was taken to be the god returning to his worshippers. It is probable that Quetzalcoatl was a historical character deified after death, or the legends may refer to several heroes of the same name. The modern school of interpreters, however, are inclined to look upon him as a nature-myth, personifying the air and the light.

QUEVEDO Y VILLEGAS, Don FRANCISCO GOMEZ DE, a Spanish classic, was b. at Madrid, Sept. 26, 1580, and studied at the university of Alcalá de Henares, where he acquired a good knowledge, not only of Latin and Greek, but also of Hebrew and Arabic, besides French and Italian. His career, which was chiefly that of a diplomatist, was marked by numerous vicissitudes. He died Sept. 8, 1645, at Villa Nueva de los Infantes.

The prose works of Quevedo y Villegas are divisible into two classes—the serious and the burlesque. Among the former are his *Vision of St. Paul*, *The Spanish Epictetus*, *Phocylides*, *Fortune become Reasonable*, and particularly *The Life of Marcus Brutus* and *The Policy of God*—the last two of which are remarkable for the purity and elevation of their sentiments. Among his satirical and burlesque productions, in which his genius finds its happiest expression, the principal are: *The Dream of the Death's Heads*, *The Demon Alquazil*, *Pinto's Sables*, *The Side-scenes of the World*, *The Letters of the Knight of the Forceps*, *Recollections of Student Life*, and *The Grand Sharper, or the History of Don Pablo de Segovia*, a romance of rascaldom, a species of fiction much cultivated in Spain at that time, in which the hero is usually an adventurous scamp. The lively sallies, the piquant allusions, and the happy metaphors found in these books have enriched Spanish literature with a crowd of proverbs and colloquial phrases. Quevedo y Villegas's poetry is also chiefly of a humorous character. His works have been often reprinted; the most complete edition is that by Sancho (Madrid, 11 vols. 1791-94); a more recent collection is the one by M. Guerra y Orbe (Madrid, 1852). An English translation of Quevedo y Villegas's satirical works was published at Edinburgh in 1798; his *Sueños*, or Visions, among the most popular of all his productions, were also translated into English by sir Roger L'Estrange (1708).

QUEZALTENANGO, a t. of Guatemala, Central America, the capital of a department of the same name. It is 66 m. w. by n. from Guatemala, and stands in an elevated table-land, on a river which flows into the Pacific ocean. After Guatemala itself, Quetzaltenango is the most important town in the state. It manufactures cotton and woolen fabrics, and carries on a considerable trade. Pop. estimated at from 25,000 to 36,000, largely Indians.

QUIBERON, a small fishing t. of France, in the department of Morbihan, at the extremity of a long slender peninsula, 25 m. s.w. of Vannes. Pop. '76, 720. It is historically celebrated as the spot where a body of French emigrant royalists, under D'Hervilly and Puisaye, landed from an English fleet, on June 27, 1795, and endeavored to rouse the people of Brittany and La Vendée against the convention, but were defeated, and driven into the sea by gen. Hoche. All the prisoners taken were shot, by order of the convention. At an earlier period, during the war of the Austrian succession, an English force attempted a landing here (1746), but was severely repulsed. In 1759 admiral Hawke completely defeated a French fleet under admiral Conflans in Quiberon bay.

QUICK ENS. See COUPE-GRASS.

QUICK-MATCH, a combustible match, made by dipping cotton-wick in a composition of vinegar, saltpeter, and sometimes an admixture of gunpowder; when lighted, it con-

tinues to burn to the end, and hence is useful in exploding mines, etc. The rate at which it burns being known, it is only necessary, for insuring safety, to take the right length of quick-match.

QUICK SILVER. See MERCURY.

QUICHÉS, or **UTLATECAS**, a nation in the highlands of Guatemala, descended from the Toltecs. They made an obstinate resistance to the Spanish conquerors under Alvarado. Tecum-Uman, king of Quiché, is said to have commanded a force of 232,000 men, who fought with courage, but were overpowered by the Spanish artillery and cavalry, and driven back after a desperate struggle of six days, during which the king was killed by Alvarado. These people still speak the ancient Quiché language.

QUICHUAS, or **QUITO INDIANS**, the ruling race in Peru under the Incas, occupying a territory extending from Quito to lake Titicaca. They attained considerable civilization; were an agricultural people, irrigated sterile land by a system of aqueducts and excavations; mined gold and silver, and were skillful in building houses and temples of adobe or stone. They conquered the Aymaras, whose territory reached from lake Titicaca to the s. boundary of Bolivia, subdued the Huancas and Chancas in the e., and after a long struggle reduced the Yuncas, a coast tribe, whom they compelled to conform to the sun worship, the religion of the Incas, who claimed descent from the sun. The Quichuas rapidly degenerated after the Spanish conquest. They made an unsuccessful effort to regain their independence in 1780.

QUIETISTS, the name of a somewhat numerous class of mystical sects, who, in different ages, have held that the most perfect state of the soul is a state of quiet, in which the soul ceases to reason, to reflect, whether upon itself or on God, and, in a word, to exercise any of its faculties, its sole function being passively to receive the infused heavenly light, which, according to their view, accompanies this state of inactive contemplation. Under the various heads, **FENELON**, **HESYCHASTS**, **BRETHREN OF THE FREE SPIRIT**, **MOLINOS**, **MYSTICISM**, most of the details of the doctrine of the Quietists have been explained. Some of these are of a purely speculative character, and involving but little of practical consequence, whether for good or for evil. But there is one most pernicious class of errors, which, however eschewed by the leaders of the various schools, has seldom failed to characterize the practical working of the system among the vulgar crowd of its followers. From the belief of the lofty and perfect nature of the purely passive state of contemplation, there is but a single step to the fatal principle in morals, that in this sublime state of contemplation all external things become indifferent to the soul, which is thus absorbed in God; that good works, the sacraments, prayer, are not necessary, and hardly even compatible with the repose of the soul; nay, that so complete is the self-absorption, so independent is the soul of corporeal sense, that the most criminal representations and movements of the sensitive part of the soul, and even the external actions of the body, fail to affect the contemplating soul, or to impress it with their debasing influence. These results will be found detailed under some of the heads named above. The chief Quietist sects have been the Messalians or Euchites, in the 4th c.; the Bogomili, in the 11 c.; the Beghards and Beguines, in the 13th c.; the Hesychasts, in the east, about the same period; the Brethren of the Free Spirit, in the 14th c.; Michael Molinos, in the 17th c.; and others of less note.

QUILIMANÉ, a sea-port of eastern Africa, in the Portuguese territory of Mozambique, stands about 15 m. from the mouth of the river of the same name. The town itself, or village, stands on a large, moist mud-bank (in any part of which water can be found by digging two ft. deep), surrounded by mango-bush and marsh. The climate is unhealthy in an eminent degree. The bar at the harbor is extremely dangerous, and the volume of water is so small, that the bed of the small stream which communicates between the Quilimane and the Zambesi (q.v.) is dry for at least nine months in the year. During the dry season trade is carried on by land-carriage. Pop. about 15,000, including the inhabitants of the country in the immediate vicinity of the town.

QUILLAIA, a genus of plants of the natural order *rosaceæ*, the type of a tribe called *quillaieæ*, with herbaceous calyx-tube, capsular fruit, and seeds winged at the apex. The suborder is remarkable for saponaceous secretions. The barks of some species of *quillaia*, as *Q. saponaria* and *Q. Brasiliensis*, are used in South America, under the name of *quillai*, as a substitute for soap. They contain a substance closely allied to *saponine*.

QUILLED, in heraldry, a term used in describing a feather, to indicate that the quill differs in tincture from the rest.

QUILLOTA, a t. of Chili, in the province of Valparaiso, and 22 m. n.e. from Valparaiso, on the Aconcagua, about 20 m. from its mouth. Quillota is a station on the railway from Valparaiso to Santiago, and is a place of some importance and considerable trade, the richest copper-mines of Chili being in its vicinity. To almost every house is attached a vineyard, but no wine is made. Pop. '75, 11,369.

QUILLS, the large feathers of the wings of birds, the hollow tubes of which, being properly cleaned of all oily or fatty matter, and dried, are used for making pens to write

with. The exact time of their introduction to use for this purpose is not known. Those plucked from geese are most generally used, but swan and turkey-quills are not uncommon; and for very fine writing, and for pen-and-ink drawing, crow-quills are preferred to all others. At one time, the collection and preparation of quills formed a very large and important branch of commerce; but the introduction of metallic pens has reduced it to very small limits. The following are the chief kinds sold by the dealers, and the list gives a correct indication of the sources of supply: Swan-quills, Iceland, etc.; English goose-quills, Irish goose-quills, Hudson's bay goose-quills, Dutch goose-quills, St. Petersburg goose-quills, Riga goose-quills, Turkey goose-quills, British crow-quills duck-quills for tooth-picks. Our imports amount to nearly 300,000,000 per annum, the value of which is about £250,000. Those of the swan fetch the highest price, or about four guineas per thousand; whilst the best goose-quills rarely exceed 20 shillings. After they have been carefully scraped and cleaned, the drying is effected by gentle heat in ovens, by which they acquire a necessary brittleness in a longitudinal direction. This is important, as, without this property, we could not make the fine slit, upon which the whole working character of the pen depends.

QUILLWORT, a genus of cryptogamic plants whose stems have a resemblance to quills. It is placed by some with the *Lycopodiaceæ*, while others assign it a separate order. The spore-cases are orbicular, plano-convex, and sessile in the axis of the leaves, the bases of which are hollowed out for the sporangia, which are united to them by the back. The spores in the outer, are much larger than those of the inner leaves, and are called *macrospores*, of which there are from 30 to nearly 200 in a spore-case. The *microspores* are very minute, each case containing, it has been estimated, over a million of them. There are about a dozen species in North America, chiefly ranging from New England to lake Superior. They are mostly aquatic evergreens, and escape notice from this circumstance, although they are not rare.

QUILOA. See **KILWA**.

QUILON (*Kayan Kalan*), a t. of India, in the state Travancore, 35 m. n.w. from Trivanderam. It is situated on the sea-coast, in a bight where ships may anchor and have shelter. Quilon has a barrack for European troops, a hospital, a jail, etc. There is a considerable export trade in timber, cocoa-nuts, ginger, pepper, etc. The communication with Trivanderam is almost entirely by canals, connecting the lagoons of the *back-water*. There is similar water-communication with towns further northward on the coast. Pop. estimated about 20,000.

QUILTOR, a fistulous wound about the top of the horse's foot, results from treads, pricks, or neglected corns, which lead to the formation of matter underneath the hoof. Any dead horn, matter, or other cause of irritation must be sought for by cutting away the hoof. A free opening must be provided for the egress of any pent-up matter. Poulticing for a few days is often useful; whilst healing may afterward be expedited by the injection of any mild astringent lotion. The powerful caustics so frequently used cause much unnecessary pain, and often aggravate the evil.

QUIMPER, an old t. of France, capital of the department of Finistère, is prettily situated on the Odet, about 9 m. from its mouth, and about 35 m. s.e. of Brest. Its cathedral, a stately and richly-carved and ornamented edifice, commenced in 1424, is the principal building. Potteries are in operation, as well as tan-yards, breweries, etc., and sardine-fishing is actively carried on. Pop. '76, 13,879.

QUIN, JAMES, a celebrated actor of Irish descent, was b. in London, Feb. 24, 1693, and made his first appearance on the stage in 1714 at Dublin as Abel in *The Committee*. Shortly after he proceeded to London, where he was engaged at Drury Lane, but for quite inferior parts. In 1716, however, the sudden illness of a leading actor led to Quin's being called on to sustain the character of Bajazet in the once famous play of *Tamerlane*. His success was marked. Next year, he exchanged Drury Lane for Mr. Rich's theater at Lincoln's Inn Fields, where he remained as a principal actor 17 years. Not long after leaving the former place, he had the misfortune to kill a brother-actor, Mr. Bowen, in a duel—a circumstance which clouded his reputation for a while. The only really fine parts which he seems to have played were captain Macheath in the *Beggars' Opera*, and Falstaff in the *Merry Wives of Windsor*. In 1734-35, he returned to Drury Lane theater, "on such terms," says Cibber, "as no hired actor had before received;" and from this date until the appearance of Garrick in 1741 he was, by universal consent, the first actor in England. Quin was by no means pleased at the rising fame of Garrick, and sarcastically expressed his chagrin by declaring that "Garrick was a new religion, and that Whitefield was followed for a time; but they would all come to church again." In this, however, he was mistaken. In 1751 he withdrew from the stage as a hired actor, though he continued at intervals to give his services for benevolent purposes, and fixed his residence at Bath, where he died Jan. 21, 1766. In after-dinner conversation he was a coarse but capital story-teller, and many of his jests are still in vogue.

QUINAULT, PHILIPPE, 1635-38; b. France; author of *Les Rivaux* and *La Mère Coquette, ou les Amants Corrigés*, comedies; and of *Astarte*, a tragedy; also of lyrical tragedies set to music by Lully. He was a member of the French academy.

QUINCE, *Cydonia*, a genus of trees and shrubs of the natural order *rosaceæ*, suborder *pomeæ*, nearly allied to *pyrus*, with which many botanists have united it, but distinguished by having many instead of two seeds in each cell, and by their very mucilaginous nature. The COMMON QUINCE (*C. vulgaris*), a native of the s. of Europe and temperate parts of Asia, is a low tree, with generally tortuous branches; ovate, entire, deciduous leaves, which are downy on the under side; and rather large, whitish flowers, which are solitary at the extremity of young branches. The fruit is in some varieties globose; in others, pear-shaped, of a rich yellow or orange color, with a strong smell. It is hard and austere, but when stewed with sugar, becomes extremely pleasant, and is much used in this way either by itself, or to impart a flavor to apple-pies. It is also much used for making a preserve called *quince marmalade*. A delicious beverage, somewhat resembling cider, is made from it. The seeds readily give out their mucilage to water, so that they turn 40 or 50 times their weight of water into a substance as thick as syrup. Quince mucilage, or quince gum, *cydonin*, is allied to bassorin, but differs from it in being readily soluble in water, whilst it differs also in some particulars from Arabin. See GUM.—The quince was cultivated by the ancient Greeks and Romans, and is at the present day cultivated in the s. of Europe, in England, and generally in temperate climates. In Scotland the fruit seldom ripens except on a wall.—The JAPANESE QUINCE (*C. Japonica*, better known by its older name, *pyrus japonica*), a low bush, a native of Japan, but perfectly hardy in Britain, is often to be seen trained against walls, being very ornamental from the profusion of its beautiful flowers.

QUINCY, a city of Illinois, on the e. bank of the Mississippi river, 160 m. n. of St. Louis, is handsomely built on a high bluff, and has a large trade by the river, railway connections with Chicago, Toledo, etc., extensive manufactures, 7 banks, 8 newspapers, and 30 churches. Pop. '70, 24,052.

QUINCY (*ante*), the co. seat of Adams co. Ill., on the Chicago, Burlington and Quincy, the Hannibal and St. Joseph, the Quincy, Alton and St. Louis, the Wabash, and Quincy, and the Missouri and Pacific railroads; pop. '80, 27,275. It is a thriving and beautiful place, regularly laid out, and has many fine residences. The streets are lighted with gas. The city has water-works, and a fire department with several steam-engines. There are 2 lines of horse-cars. There are 4 parks in the city. The fair-grounds, containing 80 acres, are 2 m. distant. There are steam saw-mills, steam flour-mills, breweries, distilleries, grain-elevators, machine-shops, carriage manufactories, etc. Steamboats run from Quincy up and down the river.

QUINCY, a t. in Norfolk co., Mass., on the Old Colony railroad; 7 m. s.e. of Boston; pop. '80, 10,529. It has churches, schools, banks, a newspaper, a public library, a granite town-hall, and the Adams academy for boys, founded by John Adams, and opened in 1872. The Quincy granite is shipped to all parts of the country. John Adams, John Quincy Adams, and John Hancock were born in Quincy. Among the notable houses are those of the Adams and Quincy families. The town was set off from Braintree in 1792.

QUINCY, EDMUND, 1681-1738; b. Mass.; educated at Harvard college. He was for many years a member of the Massachusetts legislature and of the executive council. In 1718 he was appointed a justice of the state supreme court, and in 1737 was sent to England as the agent of Massachusetts to secure a settlement of the dispute between Massachusetts and New Hampshire as to their boundary line; and he died while on this mission.

QUINCY, EDMUND, 1808-77; b. Boston; graduated at Harvard college in 1827. He was an early abolitionist, a frequent contributor to the *Anti-Slavery Standard*, of which he was at one time editor, and secretary of the American anti-slavery society. He published in *Putnam's Magazine*, 1853, a novel called *Wensley*, and wrote a *Life of Josiah Quincy*.

QUINCY, ELIZA SUSAN, b. Mass., 1800; daughter of Josiah. She has written *Memoir of Eliza Susan Morton Quincy*, 1861; and *Memoirs of the Family of Edmund Quincy of Wollston*.

QUINCY, JOSIAH, JR., 1744-75, b. Boston; graduated at Harvard college in 1763; read law with Oxenbridge Thacher, and was admitted to the bar, rising to a high rank in his profession. He denounced the stamp act through the press and at public meetings in Boston, and took strong ground against the exactions of parliament. His part in bringing on the revolution was greater than that of any other Massachusetts man except, perhaps, Joseph Warren and James Otis. In 1770 he conducted, in the face of an excited popular feeling, the defense of the British soldiers implicated in the Boston massacre; three years later, he went to Charleston, S. C., on account of his health, and took advantage of his journey to enter into relations with the patriot leaders in the southern and middle states, and to arrange for a system of communication between them and the leaders of the same party in Massachusetts. In 1774 appeared his *Observations on the Boston Port Bill*, which clearly indicated war as the only means of settling the disputes between Great Britain and the colonists, and intimated that independence must be the result. The work had much effect both at home and in England, where it was republished. An attempt was made by means of an anonymous letter to induce him not to

publish the book; but the only result was a short reply by Quincy in the *Massachusetts Gazette*. The same year he went to England, where he lived on friendly terms with Barré, Franklin, the earl of Shelburne, Priestley, and other friends of the colonies, and had interviews with lords Dartmouth and North. He carried on a correspondence with the whigs at home, and his activity drew from lord Hillsborough, in the house of lords, the remark that if the government performed its duty he "would be in Newgate or Tyburn." He sailed for home in the spring of 1775, but died on the voyage. His life was written by his son Josiah, and his *Reports of the Supreme Court of Massachusetts Bay, 1761-72*, edited by his great-grandson Samuel M., appeared in 1865.

QUINCY, JOSIAH, an American lawyer, orator, and man of letters, and son of Josiah Quincy, a distinguished orator of the revolution, was b. at Boston, Feb. 4, 1772; graduated at Harvard college, 1790; studied the profession of law; took an active interest in politics as a leading member of the federal party in New England; entered congress in 1805, where he became distinguished as a ready, earnest, and fervent orator, in opposition to the policy of Jefferson and Madison. He was one of the earliest to denounce slavery in congress, and declared that the purchase of Louisiana was a sufficient cause for the dis-solution of the union. Disgusted with the triumph of the democratic party and the war of 1812 he declined a re-election to congress, and devoted his attention to scientific agriculture. He became, however, a member of the senate of Massachusetts, and in 1822 judge of the municipal court of Boston. In 1823 he was elected mayor of Boston; and in 1829 accepted the post of president of Harvard college, which he held until 1845. Among his published works are a memoir of his father, 1825; *History of Harvard University*, 1840; *History of the Boston Athenæum*, 1851; *The Municipal History of the Town and City of Boston*, 1852; *Life of John Quincy Adams*, 1858; *Essays on the Sailing of Cattle*, 1859. Born before the American revolution, in which his father took an active and distinguished part, he lived to denounce the secession of the confederate states in 1860, and urge on the war for their subjugation. He died at Boston July 1, 1864.—His son, **EDMUND QUINCY**, is a distinguished author and orator, and was an active member of the abolitionist party.

QUINCY, JOSIAH, b. Boston, 1802; son of Josiah. He graduated at Harvard in 1821, and was admitted to the bar. He was a member of the Boston city council 1833, and its president 1834-37. In 1842 he was president of the Massachusetts senate, and in 1845 mayor of Boston. By his efforts and during his mayoralty the Cochituate aqueduct was completed. He has been a prominent advocate of co-operative methods in trade.

QUINCY, QUATREMÈRE DE. See **QUATREMÈRE DE QUINCY**.

QUINCY, SAMUEL MILLER, b. Boston, 1833; educated at Harvard college, and called to the bar. He was associate editor with John Lowell, now judge of the U. S. circuit court, of the *Monthly Law Reporter*. He served through the war, was col. of a colored regiment, and rose to the rank of brevet brig.gen. He published in 1865 *Reports of the Superior Court of the Province of Massachusetts Bay, 1761-72*, by J. Quincy, jr.

QUINIC ACID. See **KINIC ACID**, *ante*.

QUINET, EDGAR, a French author, was b. at Bourg, in the department of Ain, Feb. 17, 1803, and studied at Lyon and Paris. He made his literary *début* at the age of 20 by his *Tablettes du Juif Errant*, after which his love of philosophy and mystic reverie led him to Germany. He studied at Heidelberg, and on his return to France published a translation of Herder's *Ideen zur Philosophie der Geschichte der Menschheit*, so well executed that Cousin signalized it as *le début d'un grand écrivain*. From this early period dates his intimate friendship with Michelet (q.v.), the result of a community of feeling and belief. Quinet was a member of the scientific commission sent to the Morea in 1828, and while there, gathered materials for his *Grèce Moderne et ses Rapports avec l'Antiquité* (Par. 1830). Although his political enthusiasm was extremely ardent, he continued unabated his literary labors, and became a contributor to the *Revue des Deux Mondes*, in which *Ahasuerus*, perhaps his finest work, first appeared. From 1839 to 1842 he held the chair of foreign literature at Lyon, where his lectures on the ancient civilizations excited a profound interest. From this situation he passed to the chair of *Littératures Méridionales* at the college of France, expressly instituted for him by M. Villemain; and here, in company with Michelet, he assailed the Jesuits with a keen, earnest, epigrammatic eloquence that startled the chiefs of that body, and made even the government nervous, who knew the peril of being exposed to their secret hostility. In 1846 Quinet was silenced. He threw himself eagerly into the reform agitation that brought about the revolution of 1848, and was elected a member of the constituent and legislative assemblies, where he always voted with the extreme left; but was expelled from France after Dec. 2. On the fall of the empire Quinet returned to France, and was reinstalled in his chair at the college of France, Nov., 1870. In 1871 he was elected a member of the assembly. He died in 1875. Among his chief works are *Allemagne et Italie* (1839); *Histoire de la Poésie Epique* (1836-37); *Le Génie des Religions* (1842); *Les Jésuites*, along with Michelet (1843); *Les Révolutions d'Italie* (1848); *Mélin l'Enchanteur* (1860); *La Campagne de 1815* (1862). An edition of Quinet's *Œuvres Complètes* appeared in 1878.

QUINIA, or **QUININE**, and the other **CINCHONA ALKALOIDS**. In the barks of the different varieties of *cinchona* which are employed in the treatment of disease, several alkaloids or organic bases occur in combination with quinic and quinotannic acids. Of these bases, the most important are quinia and cinchonina, each of which is accompanied by (or connected with) two isomeric bases, termed respectively *quinidine* and *quinicine*, and *cinchonidine* and *cinchonine*; and besides these, a base termed *aricine* or *cinchovatine* occurs in the bark of *cinchona ovata*. We shall describe (1) the *chemical characters*, and (2) the *therapeutic action* of these alkaloids.

1. *Quinia* ($C_{10}H_{24}N_2O_4$) is characterized by the following properties: It crystallizes with 6 atoms of water, in the form of silky needles, from an ethereal or alcoholic solution allowed to evaporate spontaneously in a cool place; but when thrown down from acid solutions, it forms a white curdy precipitate. It is comparatively insoluble in water, requiring about 200 parts of boiling water for its solution, but dissolves readily in alcohol and in ether, and in water acidulated with a mineral acid. It has an intensely bitter taste, which is chiefly perceived at the back of the mouth; it has a well-marked alkaline reaction. It combines with acids, and forms both neutral and acid salts, most of which are capable of crystallization, and all of which possess its own bitter taste. Of these salts the acid ones are far the most soluble.

The most important of its salts is the *neutral sulphate*, represented by the formula $C_{10}H_{24}N_2O_4 \cdot HO, SO_3 + 7 Aq.$ (It was formerly termed the disulphate, till Strecker showed that the correct formula for quinia was $C_{10}H_{24}N_2O_4$, and not $C_{20}H_{12}NO_2$.) It crystallizes in long snow-white silky needles, sparingly soluble in water (yet imparting to it a peculiar bluish tint), but dissolving freely in diluted sulphuric acid and in alcohol. The *acid sulphate*, $C_{10}H_{24}N_2O_4 \cdot 2(HO, SO_3)$, is also crystallizable, and the crystals, when dried for some time at a temperature of 212° , are phosphorescent. Its solution, or an acidulated solution of the former salt, exhibits the phenomena of *fluorescence* (q. v.), in a striking manner. On heating a solution of sulphate of quinia with strong acetic acid, and adding, drop by drop, an alcoholic solution of iodine to the hot solution, we obtain crystals of a compound represented by the formula $C_{10}H_{24}N_2O_4 I_2 \cdot 2(HO, SO_3) + 10 Aq.$ These crystals, which are formed in large flat rectangular plates, present very remarkable optical properties, polarizing light as perfectly as plates of tourmaline.

This alkaloid may be obtained from several species of *cinchona*, but is most abundant in the yellow bark (*C. cardifolia*). The pulverized bark is boiled with water containing 1 per cent of oil of vitriol, which dissolves the bases that are present; the solution is precipitated by carbonate of soda, and the quinia (with the other alkaloids) extracted from the precipitate by ether. For various methods of obtaining the sulphate of quinia on a large scale for medicinal purposes, we must refer the reader to Pereira's *Materia Medica*, 4th edition, vol. ii. part 2, pp. 147-149, and the *British Pharmacopœia*, p. 315. The mother liquid from which sulphate of quinia has been obtained, contains a considerable quantity of a resinous amorphous substance known as *quinoidine*, which, when treated with ether, yields crystals of *quinidine* ($C_{10}H_{24}N_2O_4 + 4Aq.$), a base isomeric with quinia, from which again is derived another isomeric base, *quinicine*.

Cinchonina ($C_{10}H_{24}N_2O_2$) crystallizes in comparatively large quadrilateral prisms, which are anhydrous. It is less soluble in alcohol than quinia, and is insoluble in ether, and this difference of solubility affords the means of separating these two alkaloids. With acids it forms two series of salts similar to, but more soluble than, those of quinia. These salts are intensely bitter, and possess (although in a less powerful degree) the same therapeutic properties as those of quinia. In certain varieties of *cinchona* bark, a crystalline alkaloid named *cinchonidine*, isomeric with cinchonina, occurs. On exposing its salts, or those of cinchonina, to a high temperature, corresponding salts of *cinchonine* are formed. The last-named substance has the same composition as the two preceding ones, and is precipitated from its salts in the form of a resinous mass. Cinchonina and its isomeric allies are most abundant in the pale Peruvian bark (*cinchonina condaminiana*). The method of obtaining cinchonina is precisely the same as that for obtaining quinia. When both bases are present, they may be separated by converting them into sulphates; the salt of quinia is the least soluble, and crystallizes first.

The relations of the above-described alkaloids to polarized light have been carefully studied by Pasteur, and are very remarkable. Their respective effects on the plane of polarization are as follows: Quinia produces a powerful left-handed rotation; quinidine produces a powerful right-handed rotation; quinicine produces a feeble right-handed rotation; cinchonina produces a powerful right-handed rotation; cinchonidine produces a powerful left-handed rotation; cinchonine produces a feeble right-handed rotation. The action of these alkaloids thus affords an excellent illustration of the importance of circular polarization as an aid to chemical analysis.*

2. The only preparations of the above-described alkaloids included in the *British Pharmacopœia* are the *sulphate of quinia*, the *compound tincture of quinia* (which is merely a solution of the sulphate in tincture of orange-peel in the proportion of one grain to a fluid dram), and the *citrate of iron and quinia*. Sulphate of quinia is a preparation

* MM. de Vry and Alluard published some time ago a *Report*, in which they state that the polariscope reveals the presence of impurities in quinia when too small to be detected by any chemical process.

which, from its expense (about 12 shillings an ounce), is always liable to adulteration; and specimens containing gypsum, chalk, magnesia, gum, starch, boracic and stearic acids, sugar, salicine, and sulphate of cinchonia, are not unfrequently met with. The first five may be detected by their insolubility in alcohol; boracic acid by the green tinge which it gives to the alcoholic flame; stearic acid by its insolubility in dilute acids; sugar by its solubility in cold water; salicine by the addition of oil of vitriol, which turns it red; and the sulphate of cinchonia by precipitating the suspected specimens by liquor ammonia, and then adding ether, when the quinia will be dissolved, but the cinchonia will float between the two liquids. (This test for cinchonia is recommended by the French government, who refuse to allow the sale of sulphate of quinia containing more than three per cent of cinchonia.) The most important use of sulphate of quinia is in the treatment of intermittent fever, for which it may be regarded as a specific. Various nervous affections, especially if they assume a periodical character, are successfully treated by it—as, for example, neuralgia, chorea, certain forms of headache, etc. In numerous forms of dyspepsia, debility, and cachexia there is no single remedy more effectual than the citrate of iron and quinia. The ordinary dose of the sulphate is from one to three grains, but in ague it may be given in far larger doses.* It may be prescribed in the form of pills made with conserve of roses, or as mixture, in which case a little sulphuric acid should be added to render it soluble. In large doses, as from 10 to 20 grains or more, it excites the nervous system, giving rise to headache, buzzing of the ears, blindness, giddiness—a group of symptoms collectively known as *quininism*; and several deaths are recorded as arising from its administration in excessive doses. The average dose of the citrate of iron and quinia is 5 grains, which may be given in a glass of sherry. *Quinoidine* (also termed *amorphous quinine*) seems to be as efficient a tonic as sulphate of quinia, but not to have so great an anti-periodic power, and hence not to be so serviceable in intermittent fever, etc. *Quinidine* possesses the medicinal properties of quinia. Pereira and other physicians have found that its sulphate is equally serviceable with that of quinia, both as a tonic and a febrifuge; and the action of *quinicine* is similar to that of quinoidine. *Cinchonia* appears to act precisely the same as quinia, while *cinchonidine* and *cinchonine* are of little therapeutic value.
